

DUO Authentication

DUO Mobile Authentication

The screenshot shows the 'Authentication Options' panel with a sidebar containing 'Radius', 'LDAP', 'SAML Service', and 'DUO Mobile' (which is selected). The main area has a toggle for 'Enable DUO Mobile' set to 'OFF'. Below it are three text input fields labeled 'Integration key:', 'Security key:', and 'DUO API Host name:'. At the bottom right, there are two buttons: 'Test DUO configuration' and 'Save Changes'.

DUO Mobile may be used with ProVision to use two factor authentication with mobile devices. To use DUO Mobile in ProVision, you must first have a DUO account.

Once you have an account, settings may be accessed from the "Authentication" sub-tab at the top of the Admin Settings page, by clicking "DUO Mobile" under "Authentication Options".

- DUO Mobile Settings
- Disable DUO Mobile

DUO Mobile Settings

This is an identical screenshot of the Duo Authentication Options GUI shown above. It displays the 'Authentication Options' panel with 'DUO Mobile' selected, the 'Enable DUO Mobile' toggle set to 'OFF', and input fields for 'Integration key', 'Security key', and 'DUO API Host name'. The 'Test DUO configuration' and 'Save Changes' buttons are at the bottom right.

To use DUO Authentication, an account must first be set up with DUO.

Once an account is set up, obtain the following information:

- **Integration Key,**
- **Security Key, and**
- **DUO API Host name**

Enter those items into [Admin Authentication Options](#) DUO Mobile Configuration, and click "Save Changes" to save your changes.

You may also test the current configuration by clicking "Test DUO Configuration".

Disable DUO Mobile

DUO Mobile may be disabled from the GUI by turning the "Enable Duo Mobile" toggle to "OFF".

If you need to disable DUO Mobile authentication from ProVision from outside of the GUI (such as in an accidental enable), a command-line disable tool is available.

Run:

```
php tools/disable_duo.php
```
