ProVision Installation Guide

Installing ProVision

You have 6connect ProVision and now it's time to set it up! 6connect offers both cloud hosted instances and local installations of ProVision. Follow the links below for specific instructions on each instance type.

For setup assistance or additional information, you can contact our [support team](mailto:support@6connect.com) at support@6connect.com.

Table of Contents

- [Hosted Instances Guide](#)
- [Local / VM Installation Guide](#)

[Hosted Instances Guide](#)

Hosted Instances Guide

With a cloud hosted instance of ProVision, all you need is one of the following web browsers with an internet connection and login credentials!

Once you have confirmed that you have a supported browser and valid login, you can proceed to [ProVision Getting Started](#), the [ProVision User Guide](#), or the [ProVision Admin Guide](#) to learn more about ProVision.

- [Hosted Instances Guide](#)
 - [6connect Cloud Hosted Instance: Browser Requirements](#)
 - [Backup and Redundancy](#)

6connect Cloud Hosted Instance: Browser Requirements

6connect makes every effort to maintain broad compatibility across browser vendors and versions.

Web Browsers Supported:

- Firefox, Safari, Chrome, Internet Explorer, or Microsoft Edge (current versions).

Backup and Redundancy

Backup Schedule

Both local and hosted instances are provided with a default Scheduler task to perform a backup every 24 hours, with a 1 month retention policy.

Restoration

Is a phone call or email away. We can spin up a new instance with your preferred data set.

Local / VM Installation Guide

Installing ProVision

Local and VM installs of ProVision have specific requirements and configuration settings. Please follow the links below for detailed instructions on how to set up your local installation of ProVision.

For setup assistance or additional information, you can contact our [support team](mailto:support@6connect.com) at support@6connect.com.

Previous versions of this installation documentation contained a dedicated page, "6connect Local Software Installation" for the ProVision-only section of the installation process. This information is now available under each OS-specific installation page as the last section ("Install 6connect ProVision Software:").

Table of Contents

 - Hardware Requirements:
 - Software Requirements:
 - Port Requirements:

6connect Locally Hosted Instance

Initial application installation is included with the purchase of a license from 6connect. If modifications need to be made, we recommend contacting 6connect prior to any changes to ensure there is no negative impact to production systems or product functionality.

Hardware Requirements:

The optimum resource mix will be based on page views/refreshes. A larger concurrent user base with constant editing may benefit from additional RAM.

The minimum recommended hardware is:

	Minimum	Recommended
Processor	Dual-core Xeon class processor or equivalent	Quad-core Xeon
RAM	2GB RAM	4GB RAM
Storage	20 GB	100GB

*Virtual instances are also acceptable. We have confirmed functionality with Citrix Xen Essentials, VMware, KVM, etc.

Software Requirements:

Base Software Needed:

	Required	Link
Operating System	Linux/BSD/OSX	
Apache	Apache 2.4	http://httpd.apache.org/
PHP	PHP 5.6	http://php.net/downloads.php
MySQL	MySQL 5.6	http://www.mysql.com/downloads/

MySQL Triggers

6connect does not support custom MySQL triggers at this time - please email support@6connect.com if you have any questions.

Port Requirements:

Open outbound ports 443 and port 80

- cloud.6connect.com is used for license check
- checkip.dyndns.org validates the IP address of the machine to communicate with the licensing server

Backup and Redundancy: Local / VM

Backup and Redundancy

Local/VM Instance

Backup Schedule

Both local and hosted instances are provided with a default Scheduler task to perform a backup every 24 hours, with a 1 month retention policy.

Restoration

Is a phone or email away. We can spin up a new instance with your preferred data set, or send you a link to download your database. Optionally, we can even help you set it up and import your data to your new instance or assist with redundant configuration options depending on your RPO/RTO guidelines.

Backup your Data

For local customers, you should be backing up the following items:

mysqldump

And system folders off the 6connect root:

/scans

/zones

/keys

/archive

/data

ProVision Local Installation For CentOS 6

CentOS 6

- CentOS 6
- Before You Begin
- Install Requirements
 - 1) Upgrade your current packages
 - 2) Install Required Packages
 - PHP
 - MySQL
 - DNS and Additional Utilities
 - DNSSEC-Tools
 - 3) Configuring the requirements:
 - SSL
 - Apache
 - MySQL
 - 4) Optional configurations:
 - Configure SELinux
 - Configure IPTables
 - Radius (Optional)
 - SSH
 - 4) Install 6connect ProVision Software:

Before You Begin

Ensure that [System Requirements](#) have been met prior to proceeding with the CentOS Configuration Guide.

Install Requirements

1) Upgrade your current packages

Upgrade your current packages.

```
yum update
```

2) Install Required Packages

PHP

All installations of ProVision require at least PHP 5.6 (and related extensions). CentOS 6 comes with PHP 5.3 by default. You can either add a repository which provides PHP 5.6 or install PHP manually.

The Webtatic and Remi repos both have versions of PHP which are newer than those in the official repos. For this example, we'll be using Webtatic

Add the repository:

```
rpm -Uvh https://mirror.webtatic.com/yum/el6/latest.rpm
```

Update:

```
yum update
```

Install:

▼ [Click here to expand...](#)

PHP5 / Apache2 / extensions

- httpd
- php56w

- php56w-opcache
- php56w-mysqldb
- php56w-pdo
- php56w-ldap
- php56w-pecl-memcache
- php56w-bcmath
- php56w-devel
- php56w-pear
- php56w-cli

Development tools for pecl / additional system packages:

- curl
- openssl
- memcached
- mod_ssl

```
yum install httpd php56w php56w-opcache php56w-mysqldb php56w-pdo php56w-ldap
php56w-pecl-memcache php56w-bcmath php56w-devel php56w-pear php56w-cli curl openssl
memcached mod_ssl
```

MySQL

Install MySQL to use a local database.

MySQL is included with most CentOS installs, check for it with:

```
yum list installed | grep mysql
```

The default MySQL version included with most CentOS installs will need to be upgraded to the latest version:

```
rpm -Uvh https://mirror.webtatic.com/yum/el6/latest.rpm
```

If you have an existing installation, you can replace it with:

```
yum install mysql.`uname -i` yum-plugin-replace
yum replace mysql --replace-with mysql56w
```

For a fresh install:

```
yum install mysql56w mysql56w-server
```

Then, re-start and configure.

```
service mysqld start      chkconfig mysqld on
```

If a new install, set the MySQL root password:

```
/usr/bin/mysqladmin -u root password 'new-password'
```

For an existing install / upgrade, you will need to upgrade the existing tables after the restart.

```
mysql_upgrade -u root -p
```

This will issue a password prompt for the user. If you don't have a root user password, remove the "-p".

DNS and Additional Utilities

5. Install the DNS and other remaining utilities:

✓ [Click here to expand...](#)

- curl
- openssl
- nmap
- bind-utils
- bind
- expect

```
yum install curl openssl nmap bind-utils bind expect
```

DNSSEC-Tools

Install and Compile DNSSEC-Tools

```
yum groupinstall 'Development Tools'  
yum install openssl-devel perl-devel perl-CPAN  
cd /usr/src  
wget https://www.dnssec-tools.org/download/dnssec-tools-2.1.tar.gz  
tar -xzf dnssec-tools-2.1.tar.gz  
./configure  
make  
make install
```

3) Configuring the requirements:

SSL

Self signed certificates in CentOS 6 by default have been already installed.

If you want to change it, follow the steps below:

Note: For production install, it is **HIGHLY RECOMMENDED** to use organization signed certs

Generate private key, CSR, and temporary key if one hasn't been provided.

```
openssl genrsa -out ca.key 1024      openssl req -new -key ca.key -out ca.csr  
openssl x509 -req -days 365 -in ca.csr -signkey ca.key -out ca.crt
```

Copy the files to the correct locations

```
cp ca.crt /etc/pki/tls/certs      cp ca.key /etc/pki/tls/private/ca.key      cp ca.csr  
/etc/pki/tls/private/ca.csr
```

Make sure that you copy the files and do not move them if SELinux is enabled (which it is by default)

Edit the apache ssl config and put in the appropriate options:
(shown using the vi editor, though you may use the editor of your choice)

```
vi /etc/httpd/conf.d/ssl.conf
```

Find the lines that start with SSLCertificateFile and change them to be like:

```
SSLCertificateFile /etc/pki/tls/certs/ca.crt
SSLCertificateKeyFile /etc/pki/tls/private/ca.key
```

Then restart

```
/etc/init.d/httpd restart
```

Add 443 virtual hosts as needed in httpd.conf.

Apache

Allow overwrites in the apache vhosts

```
sed -i 's/AllowOverride None/AllowOverride All/g' /etc/httpd/conf/httpd.conf
```

Start Apache and make it to start on boot

```
chkconfig httpd on      service httpd start
```

mod rewrite **REQUIRED**

Please note that mod_rewrite is required! If it is not enabled in Apache, key elements will not work as expected.

MySQL

Set the MySQL Configuration:

```
mysql -p -e "SET GLOBAL sql_mode='NO_ENGINE_SUBSTITUTION';SET SESSION
sql_mode='NO_ENGINE_SUBSTITUTION';"
```

then enter the MySQL root password when prompted.

4) Optional configurations:

Configure SELinux

RE-IP WARNING

Please remember - if you change the IP address of the your server, then you will need to update SELinux functions accordingly

Most CentOS install have SELinux enabled by default. One of its protections is to not allow httpd daemon to make network connections, we need to disable this for license checks.

To view the SELinux configuration for http:

```
/usr/sbin/getsebool -a | grep httpd
```

To turn protection off for the httpd daemon for creating network connections:

```
/usr/sbin/setsebool -P httpd_can_network_connect 1
```

Configure IPTables

IPTables is enabled by default on CentOS. Add a new rule to allow 443 from anywhere. Make sure that this rule is in the chain BEFORE any blanket reject rule:

✓ If you are going to run iptables, click [here](#)

To list all current IPTable rules:

```
/etc/rc.d/init.d/iptables status
```

To add a rule for 443:

```
/sbin/iptables RH-Firewall-1-INPUT -I 5 -m state --state NEW -m tcp -p tcp --dport 443 -j ACCEPT
```

Note

The -I 5 is what adds the rule to the 5th chain position. You might need to change this depending on existing rules. Look at what rules are there before running.

To save the new config:

```
/etc/rc.d/init.d/iptables save
```

OR (some versions of centOS have different iptables names, so the above won't work)

```
vi /etc/sysconfig/iptables
```

With the file open for editing, add:

```
-A RH-Firewall-1-INPUT -m state --state NEW -m tcp -p tcp --dport 443 -j ACCEPT
```

Once complete - restart the iptables service:

```
/etc/init.d/iptables restart
```

Customers can alter this post install to allow only their IP space, plus the 6connect management space.

Radius (Optional)

This section only needs to be followed if the customer will be using Radius for authentication.

✓ If you are going to use radius authentication, click [here](#).

Install radius module:

```
pecl install radius      echo extension=radius.so > /etc/php.d/radius.ini
```

SSH

Install ssh module:

```
yum install libssh2-devel      pecl install -f ssh2      echo extension=ssh2.so >
/etc/php.d/ssh2.ini
```

4) Install 6connect ProVision Software:

1. Remove the current contents in the ProVision web folder (currently the www root) and after extract the archive contents (where 5.x.x is the version number for the build) :

```
tar -xf productionBuild-5.x.x-php5.6.tar -C /var/www/html
```

2. Change the permissions to be the web user permissions

```
chown -R apache.apache /var/www/html
```

3. Go to <http://<web root>/install/configTest.php>. Follow the provided instructions, correcting any configuration errors if they occur. Once all steps are completed, you are ready to use your ProVision instance!

ProVision Local Installation For CentOS 7

CentOS 7

- CentOS 7
- Before You Begin
- Install Requirements
 - 1) Upgrade your current packages
 - 2) Install Required Packages
 - PHP
 - MySQL
 - DNS and Additional Utilities
 - DNSSEC-Tools
 - 3) Configuring the requirements:
 - SSL
 - Apache
 - MySQL
 - 4) Optional configurations:
 - Configure SELinux
 - Configure IPTables
 - Radius (Optional)
 - SSH
 - 5) Install 6connect ProVision Software:

Before You Begin

Ensure that [System Requirements](#) have been met prior to proceeding with the CentOS Configuration Guide.

Install Requirements

1) Upgrade your current packages

Upgrade your current packages.

```
yum update
```

2) Install Required Packages

PHP

All installations of ProVision require at least PHP 5.6 (and related extensions). CentOS 7 comes with PHP 5.4 by default. You can either add a repository which provides PHP 5.6 or install PHP manually.

The Webtatic and Remi repos both have versions of PHP which are newer than those in the official repos. For this example, we'll be using Webtatic

Add the repository:

```
rpm -Uvh https://dl.fedoraproject.org/pub/epel/epel-release-latest-7.noarch.rpm  
rpm -Uvh https://mirror.webtatic.com/yum/el7/webtatic-release.rpm
```

Install PHP and extensions:

✓ [Click here for the list of extensions...](#)

PHP5 / Apache2 / extensions

- httpd
- php56w
- php56w-opcache
- php56w-mysqlnd
- php56w-pdo
- php56w-ldap
- php56w-pecl-memcache
- php56w-bcmath

- php56w-devel
- php56w-pear
- php56w-cli

Development tools for pecl / additional system packages:

- curl
- openssl
- memcached
- mod_ssl

```
yum install httpd php56w php56w-opcache php56w-mysqlnd php56w-pdo php56w-ldap
php56w-pecl-memcache php56w-bcmath php56w-devel php56w-pear php56w-cli curl openssl
memcached mod_ssl
```

MySQL

Install MySQL/ MariaDB to use a local database.

MySQL is included with most CentOS installs, check for it with:

```
yum list installed | grep mysql
```

✓ [If MySQL is not installed, click here...](#)

If it is not installed:

```
rpm -Uvh http://repo.mysql.com/mysql-community-release-el7-5.noarch.rpm
yum install mysql-server
service mysqld start
chkconfig mysqld on
```

Set the MySQL root password:

```
/usr/bin/mysqladmin -u root password 'new-password'
```

✓ [To install MariaDB instead of MySQL, click here...](#)

If you prefer to install MariaDB:

```
yum install mariadb-server mariadb
systemctl start mariadb
```

Set the root password, as currently it is not set, just hit ENTER on the current password:

```
mysql_secure_installation
```

Set so that it starts on boot:

```
systemctl enable mariadb.service
```

DNS and Additional Utilities

5. Install the DNS and other remaining utilities:

✓ [Click here for the list of utilities...](#)

- curl
- openssl
- nmap
- bind-utils
- bind
- expect
- wget
- bzip2

```
yum install curl openssl nmap bind-utils bind expect wget bzip2
```

DNSSEC-Tools

Install and Compile DNSSEC-Tools

```
yum groupinstall 'Development Tools'
yum install openssl-devel perl-devel perl-CPAN
cd /usr/src
wget https://www.dnssec-tools.org/download/dnssec-tools-2.2.tar.gz
tar -xzf dnssec-tools-2.2.tar.gz
./configure
make
make install
```

3) Configuring the requirements:

SSL

1. Self signed certificates in CentOS 7 by default have been already installed.

If you want to change it, follow the steps below:

Note: For production install, it is **HIGHLY RECOMMENDED** to use organization signed certs

✓ [Click here to expand...](#)

Generate private key, CSR, and temporary key if one hasn't been provided.

```
openssl genrsa -out ca.key 1024
openssl req -new -key ca.key -out ca.csr
openssl x509 -req -days 365 -in ca.csr -signkey ca.key -out ca.crt
```

Copy the files to the correct locations

```
cp ca.crt /etc/pki/tls/certs
cp ca.key /etc/pki/tls/private/ca.key
cp ca.csr /etc/pki/tls/private/ca.csr
```

Make sure that you copy the files and do not move them if SELinux is enabled (which it is by default)

Edit the apache ssl config and put in the appropriate options:

(shown using the vi editor, though you may use the editor of your choice)

```
vi /etc/httpd/conf.d/ssl.conf
```

Find the lines that start with SSLCertificateFile and change them to be like:

```
SSLCertificateFile /etc/pki/tls/certs/ca.crt  
SSLCertificateKeyFile /etc/pki/tls/private/ca.key
```

Then restart.

```
/etc/init.d/httpd restart
```

Add 443 virtual hosts as needed in httpd.conf.

Apache

Allow overwrites in the apache vhosts

```
sed -i 's/AllowOverride None/AllowOverride All/g' /etc/httpd/conf/httpd.conf
```

Start Apache and make it start on boot

```
systemctl start httpd.service  
systemctl enable httpd.service
```

mod rewrite **REQUIRED**

Please note that mod_rewrite is required! If it is not enabled in Apache, key elements will not work as expected.

MySQL

Set the MySQL Configuration:

```
mysql -p -e "SET GLOBAL sql_mode='NO_ENGINE_SUBSTITUTION';SET SESSION  
sql_mode='NO_ENGINE_SUBSTITUTION';"
```

Then enter the MySQL root password when prompted.

4) Optional configurations:

Configure SELinux

RE-IP WARNING

Please remember - if you change the IP address of the your server, then you will need to update SELinux functions accordingly

Most CentOS install have SELinux enabled by default. One of its protections is to not allow httpd daemon to make network connections, we need to disable this for license checks.

To view the SELinux configuration for http:

```
/usr/sbin/getsebool -a | grep httpd
```

To turn protection off for the httpd daemon for creating network connections:

```
/usr/sbin/setsebool -P httpd_can_network_connect 1
```

Configure IPTables

IPTables is enabled by default on CentOS. Add a new rule to allow 443 from anywhere. Make sure that this rule is in the chain BEFORE any blanket reject rule:

▼ [If you are going to run iptables, click here](#)

To list all current IPTable rules:

```
iptables -L
```

To add a rule for 443:

```
/sbin/iptables RH-Firewall-1-INPUT -I 5 -m state --state NEW -m tcp -p tcp --dport  
443 -j ACCEPT
```

Note

The -I 5 is what adds the rule to the 5th chain position. You might need to change this depending on existing rules. Look at what rules are there before running.

To save the new config:

```
/etc/rc.d/init.d/iptables save
```

OR (some versions of CentOS have different iptables names, so the above won't work)

```
vi /etc/sysconfig/iptables
```

With the file open for editing, add:

```
-A RH-Firewall-1-INPUT -m state --state NEW -m tcp -p tcp --dport 443 -j ACCEPT
```

Once complete - restart the iptables service:

```
/etc/init.d/iptables restart
```

Customers can alter this post install to allow only their IP space, plus the 6connect management space.

Radius (Optional)

This section only needs to be followed if the customer will be using Radius for authentication.

✓ If you are going to use radius authentication, [click here](#).

Install radius module:

```
pecl install radius
echo extension=radius.so > /etc/php.d/radius.ini
```

SSH

Install ssh module:

```
yum install libssh2-devel
pecl install -f ssh2
echo extension=ssh2.so > /etc/php.d/ssh2.ini
```

5) Install 6connect ProVision Software:

1. Remove the current contents in the ProVision web folder (currently the www root) and after extract the archive contents (where 5.x.x is the version number for the build):

```
tar -xf productionBuild-5.x.x-php5.6.tar -C /var/www/html
```

2. Change the permissions to be the web user permissions

```
chown -R apache.apache /var/www/html
```

3. If enabled SELinux you must execute the following command:

```
chcon -R -t httpd_sys_rw_content_t /var/www/html
chcon -R -t httpd_sys_rw_content_t /tmp
```

You must also execute the same command for the 6c secure path created from **configSecureKeys.sh**

4. Go to <http://<web root>/install/configTest.php>. Follow the provided instructions, correcting any configuration errors if they occur. Once all steps are completed, you are ready to use your ProVision instance!

ProVision Local Installation For Debian 7/8

Debian 7/ Debian 8

- Debian 7/ Debian 8
- Before You Begin
- Install Requirements
 - 1) Upgrade your current packages
 - 2) Install Required Packages
 - PHP
 - MySQL
 - DNS and Additional Utilities
 - 3) Configuring the requirements:
 - SSL
 - Apache
 - MySQL
 - 4) Optional configurations:
 - Radius (Optional)
 - 5) Install 6connect ProVision Software:

Before You Begin

Ensure that System Requirements have been met prior to proceeding with the Installation Guide.

Install Requirements

1) Upgrade your current packages

Upgrade your current packages.

```
apt-get update
apt-get upgrade
```

2) Install Required Packages

PHP

This step is only applicable to Debian 7 users. If you are using Debian 8, please skip this step.

All installations of ProVision require at least PHP 5.6 (and related extensions). Debian Wheezy comes with PHP 5.4 by default. You can either add a repository which provides PHP 5.6 or install PHP manually. In this example, we are going to use 3rd party repository that also upgrades the Apache to 2.4 as well as some other packages.

Edit sources.list:
(shown using the vi editor, though you may use the editor of your choice)

```
vi /etc/apt/sources.list
```

Add the following lines to sources.list:

```
deb http://packages.dotdeb.org wheezy-php56 all
deb-src http://packages.dotdeb.org wheezy-php56 all
```

Install the GPG key:

```
wget https://www.dotdeb.org/dotdeb.gpg
apt-key add dotdeb.gpg
```

And update the packages list:

```
apt-get update
```

Install Apache2/PHP5/MySQL and development tools for pecl:

▼ [Click here for the list of extensions...](#)

PHP5 / Apache2 / extensions

- apache2
- libapache2-mod-php5
- php5
- php5-cgi
- php5-cli
- php5-gd
- php5-curl
- php5-ldap
- php5-mysqlnd
- php5-ssh2
- php-pear
- php5-dev

Development tools for pecl / additional system packages:

- curl
- openssl
- memcached
- php5-memcache

```
apt-get install apache2 libapache2-mod-php5 php5 php5-cgi php5-cli php5-gd php5-curl
php5-ldap php5-mysqlnd php5-ssh2 php-pear php5-dev curl openssl memcached php5-memcache
```

While installing you will be asked to set the MySQL root password.

MySQL

Install MySQL to use a local database.

```
apt-get install mysql-server
```

You will be asked to enter a root password for the mysql server.

DNS and Additional Utilities

Install the DNS and other utilities:

▼ [Click here to expand...](#)

- curl
- openssl
- memcached
- php5-memcache
- nmap
- dnsutils
- bind9utils
- dnssec-tools
- expect

```
apt-get install curl openssl memcached php5-memcache nmap dnsutils bind9utils  
dnssec-tools expect
```

3) Configuring the requirements:

SSL

Enable the necessary apache modules with the following command:

```
a2enmod php5 ssl rewrite
```

In order to create self signed certificates and to work properly, the hostname must be resolved properly.
Open the hosts file for editing:

```
vi /etc/hosts
```

Add a record for your hostname

```
yourhostname X.X.X.X
```

Create self signed certificate:

```
make-ssl-cert generate-default-snakeoil --force-overwrite
```

Apache

mod rewrite REQUIRED

Please note that mod_rewrite is required! If it is not enabled in Apache, key elements will not work as expected.

Enable the default vhost for apache

```
a2ensite default-ssl
```

Allow overwrites in the apache vhosts

```
sed -i 's/AllowOverride None/AllowOverride All/g'  
/etc/apache2/sites-available/default*
```

6. Reload apache

```
service apache2 reload
```

MySQL

MySQL Configuration:

```
mysql -p -e "SET GLOBAL sql_mode='NO_ENGINE_SUBSTITUTION';SET SESSION sql_mode='NO_ENGINE_SUBSTITUTION';"
```

Then, enter the MySQL root password when prompted.

4) Optional configurations:

Radius (Optional)

This section only needs to be followed if the customer will be using Radius for authentication.

✓ [If you are going to use radius authentication, click here.](#)

1. Install radius module:

Debian 7:

Debian 7:

```
pecl install radius
```

Debian 8:

Debian 8:

```
apt-get install php5-radius
```

Create module loading configuration:

(shown using the vi editor, though you may use the editor of your choice)

```
vi /etc/php5/mods-available/radius.ini
```

Add the following lines to radius.ini:

```
; configuration for php radius module  
; priority=20  
extension=radius.so
```

To enable the radius module, type the following command:

```
php5enmod radius
```

5) Install 6connect ProVision Software:

1. Remove the current contents in the ProVision web folder (currently the www root) and after extract the archive contents (where 5.x.x is the version number for the build):

```
tar -xf productionBuild-5.x.x-php5.6.tar -C /var/www/
```

2. Change the permissions to be the web user permissions

```
chown -R www-data:www-data /var/www
```

3. Go to <http://<web root>/install/configTest.php>. Follow the provided instructions, correcting any configuration errors if they occur. Once all steps are completed, you are ready to use your ProVision instance!

ProVision Local Installation For Ubuntu

Ubuntu 14.04 LTS

- Ubuntu 14.04 LTS
- Before You Begin
- Install Requirements
 - 1) Upgrade your current packages
 - 2) Install Required Packages
 - PHP
 - MySQL
 - DNS and Additional Utilities
 - 3) Configuring the requirements:
 - SSL
 - Apache
 - MySQL
 - 4) Optional configurations:
 - Radius (Optional)
 - SSH
 - 5) Install 6connect ProVision Software:

Before You Begin

Ensure that System Requirements have been met prior to proceeding with the Installation Guide.

Permissions

Before installing, verify that you have appropriate install permissions. Depending on your permissions and system setup, commands may need to be run as superuser by prepending "sudo" to the listed commands.

Install Requirements

1) Upgrade your current packages

Upgrade your current packages.

```
apt-get update
apt-get upgrade
```

2) Install Required Packages

PHP

All installations of ProVision versions 5.2.0 or later require PHP 5.6 and related extensions. You can either add a repository which provides PHP 5.6 or install PHP manually. In this example, we use the default package sources for Ubuntu 14.04 to install Apache 2.4 and PHP 5.6. We also provide an option to install PHP 5.6 through a third-party repository.

✓ [If you are installing PHP 5.6 click here...](#)

If you are installing ProVision 5.2.0, or after, make sure that your build archive has "php5.6" as part of its name. For example "productionBuild-5.2.0-php5.6.tar".

1. Add PHP 5.6 package sources to your system:

```
add-apt-repository ppa:ondrej/php
```

and confirm with ENTER to continue.

If you get an error here, you may need to install python-software-properties first and then repeat the repository add as follows:

```
apt-get update
apt-get install python-software-properties

add-apt-repository ppa:ondrej/php
```

2. Update packages:

```
apt-get update
```

3. Install PHP:

```
apt-get install php5.6
```

and confirm with “y” and ENTER.

You'll now see “PHP 5.6.x” in the scrolling installation logs.

To verify the installed version of PHP, run:

```
php5 -v
```

Install Apache2/PHP5/MySQL and development tools for pecl:

▼ [Click here for the list of extensions...](#)

PHP5 / Apache2 / extensions

- apache2
- libapache2-mod-php5
- php5
- php5-cgi
- php5-cli
- php5-gd
- php5-curl
- php5-ldap
- php5-mysqlnd
- php-pear
- php5-dev

Development tools for pecl / additional system packages:

- curl
- openssl

```
apt-get install apache2 libapache2-mod-php5 php5 php5-cgi php5-cli libssh2-php php5-ssh2
php5-gd php5-curl php5-ldap php5-mysql php-pear php5-dev curl openssl
```

MySQL

ProVision 5.2 and above require MySQL 5.6.20 and above.

▼ [To install MySQL 5.6.20+, click here...](#)

Add new repository for MySQL 5.6 distribution.

```
apt-key adv --keyserver pgp.mit.edu --recv-keys 5072E1F5
echo "deb http://repo.mysql.com/apt/ubuntu/ trusty mysql-5.6" >>
/etc/apt/sources.list.d/mysql.list
```

Update current packages.

```
apt-get update
```

Install MySQL 5.6 to use a local database.

```
apt-get install mysql-server-5.6
```

You will be asked to enter a root password for the mysql server.

MySQL is now installed. You can proceed to next section [DNS And Additional Utilities](#)

Install MySQL to use a local database.

```
apt-get install mysql-server
```

You will be asked to enter a root password for the mysql server.

DNS and Additional Utilities

Install the DNS and other utilities:

▼ [Click here to expand...](#)

- curl
- openssl

- nmap
- dnsutils
- bind9utils
- dnssec-tools
- expect

```
apt-get install curl openssl nmap dnsutils bind9utils dnssec-tools expect
```

3) Configuring the requirements:

SSL

Enable the necessary apache modules with the following command:

```
a2enmod php5 ssl rewrite headers
```

In order to create self signed certificates and to work properly, the hostname must be resolved properly.
Open the hosts file for editing:

```
vi /etc/hosts
```

Add a record for your hostname

```
X.X.X.X yourhostname
```

Create self signed certificate:

```
make-ssl-cert generate-default-snakeoil --force-overwrite
```

Apache

mod rewrite REQUIRED

Please note that mod_rewrite is required! If it is not enabled in Apache, key elements will not work as expected.

Enable the default vhost for apache

```
a2ensite default-ssl
```

Allow overwrites in the apache vhosts

```
sed -i 's/AllowOverride None/AllowOverride All/g' /etc/apache2/apache2.conf
```

Update site configurations to use /var/www for docroot

```
sed -i 's/\var/www/html/\var/www/' /etc/apache2/sites-available/000-default.conf  
sed -i 's/\var/www/html/\var/www/' /etc/apache2/sites-available/default-ssl.conf
```

Restart apache

```
service apache2 restart
```

MySQL

MySQL Configuration:

```
mysql -p -e "SET GLOBAL sql_mode='NO_ENGINE_SUBSTITUTION';SET SESSION  
sql_mode='NO_ENGINE_SUBSTITUTION';"
```

Then, enter the MySQL root password when prompted.

4) Optional configurations:

Radius (Optional)

This section only needs to be followed if the customer will be using Radius for authentication.

✓ [If you are going to use radius authentication, click here.](#)

Install radius module:

Debian 8:

```
apt-get install php5-radius
```

Create module loading configuration:

(shown using the vi editor, though you may use the editor of your choice)

```
vi /etc/php5/mods-available/radius.ini
```

Add the following lines to radius.ini:

```
; configuration for php radius module
; priority=20
extension=radius.so
```

To enable the radius module, type the following command:

```
php5enmod radius
```

SSH

Install ssh module:

```
apt-get install libssh2-1-dev
```

then run

```
pecl install -f ssh2
```

Create module loading configuration:

(shown using the vi editor, though you may use the editor of your choice)

```
vi /etc/php5/mods-available/ssh2.ini
```

Add the following lines to ssh2.ini (adding extension=ssh2.so to your ssh2.ini):

```
; configuration for php ssh2 module
; priority=20
extension=ssh2.so
```

To enable, type the following command:

```
php5enmod ssh2
```

Reload apache

```
service apache2 reload
```

5) Install 6connect ProVision Software:

The latest version of ProVision can be found at <https://cloud.6connect.com/Download/Latest/> and downloaded using the credentials provided to you.

If you need credentials provided to you, or any other assistance, please contact our support team at support@6connect.com.

1. Remove the current contents in the ProVision web folder location (currently the www root) and after extract the archive contents (where 5.x.x is the version number for the build):

```
tar -xf productionBuild-5.x.x-php5.6.tar -C /var/www/
```

2. Change the permissions to be the web user permissions

```
chown -R www-data:www-data /var/www
```

3. Go to <http://<web root>/install/configTest.php>. Follow the provided instructions, correcting any configuration errors if they occur. Once all steps are completed, you are ready to use your ProVision instance!

6connect Local Software Upgrades

Local Software Upgrades

- Local Software Upgrades
 - Upgrade Methods for Local Installs of 6connect Provision
 - Old Method
 - Command Line
 - GUI

Upgrade Methods for Local Installs of 6connect Provision

Upgrades after 4.1.20 and up

You must be running at least 4.1.20 to follow any of the upgrade methods listed below. If you are not yet at this version, upgrade to 4.1.20 using the old upgrade process first, and then continue using the new upgrade process or contact support@6connect.com or any questions or to schedule an upgrade to the latest version.

There are now 3 different methods to run upgrades.

Old Method

(See Upgrades prior to 4.1.19 for detailed instructions)

Download the latest 6connect tar file from <https://cloud.6connect.com/Download/Latest/>

Extract in web root.

Run the upgrade scripts located in upgrade/scripts in order of version number via `php <upgrade-script.php> -v`

Command Line

In upgrade/scripts run 'php upgrade.php -h' to get the help and full usage of upgrade.php. This script will automatically get the latest tar file, create a backup, and run all the necessary upgrades between the current and latest version. The most common usage of upgrade will look like this 'php upgrade.php -v -b </path/to/store/backup>'

GUI

In the 6connect tool, navigate to Admin. If there is a new version available, an Upgrade button will be available. Click on the Upgrade Now button to go to the upgrade page. It will automatically download the latest version available, run all upgrade scripts, and create a log of the upgrade process.

Upgrades prior and up to 4.1.19

IMPORTANT NOTE FOR 4.1.15 - The configDir.sh script must be run as root after the 4.1.15 tar file is unpacked and before running upgrade-4.1.15.php.

1. Create a database backup.

```
mysqldump -u <user> -p<pass> <6connect database name> > /tmp/6connectDBBackup.<date>.sql
```

2. Create a directory backup. Even if you have offsite backup's with 6connect enabled, perform this step to ensure the most current data is saved.

```
tar -cvf 6connectFileBackup.<date>.tar /path/to/webroot
```

3. Move the tar file in 6connect web root.

```
tar -xof productionBuild-4.1.4.tar
```

This will place all the new files into your web root directory.

4. Run database upgrades, located in ./dev.

The simple rule of thumb is to run every database upgrade from the version after yours, to the version you want to get to. Here is the short cut list:

If upgrading from 4.1.0 or higher:

```
php upgrade-4.1.3.php -v
```

```
php upgrade-4.1.4.php -v
```

```
php upgrade-4.1.5.php -v
```

```
php upgrade-4.1.6.php -v
```

```
php upgrade-4.1.7.php -v
```

php upgrade-4.1.8.php -v
php upgrade-4.1.9.php -v
php upgrade-4.1.10.php -v
php upgrade-4.1.11.php -v
php upgrade-4.1.12.php -v
php upgrade-4.1.13.php -v
php upgrade-4.1.14.php -v
configDir.sh <web user> (after tar 4.1.15 tar file unpacked)
php upgrade-4.1.15.php -v
php upgrade-4.1.16.php -v
php upgrade-4.1.17.php -v
php upgrade-4.1.18.php -v
php upgrade-4.1.19.php -v

If upgrading from 3.9.3:

Contact 6connect Support - support@6connect.com

5. Check directory/file permissions for the following and make sure they read/write for the web user:

archive
keys
scans
zones
data/globals.php
images/custom

configDir.sh can be run to correct any permissions issues.

Check the imports directory for read/write permission in the configured php session dir.

6. `http://<web root>/install/configTest.php`. If there are any configuration errors listed, they must be corrected.

7. Login and use!

Local Installations - Peering Setup

Peering Setup - Local Installations:

ProVision uses a locally-hosted mirror of the PeeringDB database in order to perform non-edit Peering functions. There are a few steps to take in order to set up your locally hosted instance to coordinate with PeeringDB information.

As of PeeringDB 2.0, SQL dump files are no longer provided. If you are using ProVision 5.3.0 or higher, you must follow this new install process. If you are using a lower version of ProVision, then please follow the instructions in the previous version of this page.

1) Create a new database to store the PeeringDB data. This **must** be on the same server as the database which is used by ProVision.

2) Download, install, and use the PeeringDB Python Client to populate the database.

The PeeringDB documentation is available here: <http://peeringdb.github.io/peeringdb-py/>

3) Once this has been done, edit the ProVision global configuration file located here:

```
[ProVision Root]/data/globals.php
```

It must be updated with the following variables to inform ProVision of the location of this new install. The username and password fields correspond to the username and password of the MySQL account which has access to the database (Not the username and password to your PeeringDB account).

This can, but does not have to be, the same MySQL user which is used for the ProVision database. However, the ProVision MySQL user **must** have at least READ access to the PeeringDB database.

```
$peeringdb_host = 'localhost';           // Database host must be the same for provision
and peering
$peeringdb_username = 'username';       // username for the MySQL user
$peeringdb_password = 'password';      // password for the MySQL user
$peeringdb_db_name = 'peeringdb';      // name of the database in MySQL
```

4) Periodically sync with the PeeringDB server to get the latest updates. This can be done manually, or there are instructions in the PeeringDB documentation on how to automatically schedule syncs using cron (<http://peeringdb.github.io/peeringdb-py/cli/#sync>).

ProVision Getting Started

Welcome to ProVision!

Our Getting Started documents provide an overview of concepts to orient you to working in ProVision. Below are some of the resources available. If you need setup assistance or additional information, you can contact our support team at support@6connect.com.

- Welcome to ProVision!
 - ProVision Getting Started
 - ProVision User Guide
 - ProVision Admin Guide
 - ProVision Developer Tools
 - Additional Resources

ProVision Getting Started

[First Steps](#) - Not sure where to begin? Here are some key items to consider when setting up your first ProVision instance, high level overviews of Resources, Permissions, and Importing data into ProVision.

[Resource Concepts](#) - The Resource Management System is a key component of ProVision. This system supports a variety of hierarchies and metadata - understanding how these pieces can be used is important prior to importing data or setting up the application.

[Workflow Concepts](#) - ProVision has two distinct interfaces depending on the user level and task. It is important to understand how these interfaces work together from the centralized data. This is important for user on-boarding and training of internal operations staff, developers or engineering teams.

[UI Element Legend](#) - ProVision has some UI elements that you should be familiar with for easy day to day operation.

ProVision User Guide

The user guide gives you an overview on the standard UI functions of ProVision and installed Modules.

ProVision Admin Guide

The Admin Guide provides an overview of administrative functions of the different functional areas of ProVision.

ProVision Developer Tools

The Developer Tools section has details on our [API](#) and related information - including [code samples](#).

Additional Resources

You can also browse the [Tutorials](#) and [FAQ](#), if you have any questions, please contact our support team at support@6connect.com.

Overview Video: First Steps - Part 1

This video gives a high level overview of the "Before you Begin" content on this page, as well as an introduction to ProVision's Resource System.

This video may also be viewed at <https://www.youtube.com/watch?v=apJRcQv3ZQ0>.

Before you Begin

We recommend that new users work through the following questions with their internal team to plan their ProVision instance:

Need Help?

Remember that 6connect's engineers are here to help. If you have questions, or want to test out some ideas, our team has worked with a variety of data sets and can help get you started on the right path. You can reach us any time at support@6connect.com.

1) What type of physical and non-physical components do you wish to track?

Impacts: What Sections and Resources are created

An important first step is determining what items you currently are, or will be, tracking, and what relationship they have with each other. ProVision's flexible Resource system allows you create and customize detailed entries for any type of item you may want to track: Customers, Contacts, Data Centers, Routers, VMs, and more. These types of resources are labeled as "Sections" in ProVision. Once a section is made, individual items (resources) may be created as a part of that Section. Each Section may have different Gadgets selected, which then provide additional functionality on a resource entry page.

See: [Working with Resources](#), [Customizing Sections](#), [Gadgets](#)

2) What is your current data structure? What is your ideal data structure?

Impacts: Resource Hierarchy, Assignment Behavior

The resource hierarchy structure in ProVision allows for "child" resources to be created under a parent resource (for example: servers as children under a datacenter resource entry, or subsidiaries under a parent company, who then share IP aggregates). The structure decided upon will influence how resources are set up in ProVision, as well as the behaviors of functions while working with items such as IP blocks or DNS zones.

See: [Working with Resources](#), [Resource Concepts](#)

3) Who needs access to what data?

Impacts: User and Group Permissions

In ProVision, standard user permissions are set by resource and functional area (IPAM, Resource, Peering, etc). Global Admin permissions give access to additional functions such as configuration settings, importing, and Scheduler tasks. Determine which users will require administrative access, and which will have access to only specific resources or functional areas. You will need to get more specific later, but having some high level groups to work with is a great start.

See: [Users & Permissions](#)

Overview Video: First Steps - Part 2

This video gives a high level overview of the "Getting your Data into ProVision" content on this page.

This video may also be viewed at <https://www.youtube.com/watch?v=2e0H1H4rTTs>.

Getting your Data into ProVision

After determining your internal goals and processes, it's time to get your data into ProVision!

Start Small

When importing data into ProVision, data validation is a key step to ensure that everything is accurate. Upon importing your data, you may see some errors that result in a stop in the import process! It is recommended that you break up your imports to both keep them manageable and give you a chance to normalize your data prior to importing.

1) Gather and Prep your data

Determine where your data will be from:

Excel / Spreadsheets:

May be used to import: Resources, IP Aggregates/ Blocks, DNS BIND Zones

If you currently use Excel or other spreadsheet program for tracking, you will need to verify that your spreadsheets are "cleaned up" according to the information on the [Importing Your Data](#) page under "Preparing for Data Import". Make sure that you use UTF-8 encoding, remove extraneous blank rows, and compare your data to the data fields available in ProVision, shown under "[Which Import Tool Should I Use?](#)". Review [sample files](#) if desired to see example formats. If you plan to track custom types of Resources by creating Sections, you will need to [create a Section with custom fields](#), and verify that your spreadsheet contains the same fields.

Once your verification / cleanup is complete, export your spreadsheet as a .csv file.

See: [Importing Your Data](#), [Working with Resources](#), [Import DNS Zones](#)

RIR

May be used to import: IP Aggregates

No advance preparation is needed for aggregates imported from RIR. ProVision's built-in importer will ask for your ORGID or an IP, and then populate an aggregate list from that information. Simply choose which aggregates you wish to import.

See: [Import Aggregate Blocks](#)

DNS Servers

May be used to import: DNS Zones

ProVision provides automated tools for importing DNS zones from the following server types: BIND, PowerDNS, InfoBlox, NS One, Dyn DNS, and DNSMadeEasy servers.

Before importing DNS zones, it is recommended that a [DNS Group](#) be created to hold the zones being imported, and that the [DNS server](#) be added into ProVision so that zone updates may be pushed.

For general DNS tasks, see: [DNS Administration](#), [DNS Tab](#), [Working with DNS Groups](#), [Working with DNS Servers](#)

For specific DNS zone import instructions for each DNS server type, see: [Import DNS Zones](#)

Manually Adding Data

ProVision allows manual adding of data at any time. We recommend verifying that the item has not already been added beforehand (to prevent duplicates), and keeping your desired data structure in mind.

2) Import or Manually Add Data

The order in which items are added will depend on what ProVision functional area (Resources, IPAM, DNS) you will be using, and what the current / desired data structure is. In general, the following order is recommended:

A) Resources

Importing or creating your resources first allows subsequent items to be associated with those resources.

Note: If you already have "Resource" data associated with your IP block data (ie, as fields in a spreadsheet with Resource Name and Resource ID), you may choose not to create those resources ahead of time. The [IP Import from CSV](#) tool will give you an option to create those Resources during the IP import process.

Import customers, physical devices, locations, and so forth through the [Resource Import from CSV](#) tool. If you wish for additional customization, you can [create a custom Section](#), [add the desired fields](#), and import resources under that Section through the [Resource Import Tool](#).

Adding resources manually may be done at any time under the [Resources](#) Tab, by clicking the "Add Entry" button.

See: [Working with Resources, Importing Your Data](#)

B) IP Aggregates and Blocks

Import your IP Aggregates through the [Import from RIR](#) tool, or from a .csv file via [IP Import from CSV](#).

The Import from CSV tool will create Top-Level Aggregates and place blocks under those aggregates based on the following method:

First, the importer will parse through the provided data, order all blocks from largest to smallest, then attempt to split the largest block out of an existing block matching the IP space and RIR. If that fails (no larger block exists), then that block is added in the system as its own Top-Level-Aggregate. Subsequent blocks will undergo the same process.

This method ensures that your list of IP blocks does not need to be organized in any particular order.

If your import includes a large number of small blocks (/30s, /32s), be sure you've included at least one large block which encompasses them (/24, /22). This will ensure that the smaller blocks are neatly organized under the larger block, rather than imported as their own Top-Level Aggregates.

See: [Importing Your Data](#)

C) Add DNS servers and zones

If using the DNS functionality in ProVision, you will need to add your servers prior to importing zones.

Add DNS Servers

Adding DNS Servers requires administrative access.

Servers are added under the DNS Tab of ProVision, under "DNS Servers". Click on "Add Server" and fill out the server information.

See: [Working with DNS Servers](#)

Information for specific server types is available under the following sections:

[Configuring ISC BIND Support](#)

[Configuring PowerDNS Support](#)

[Configuring Secure64 Support](#)

Import DNS Zones

After creating the applicable servers in ProVision, you may import or manually add DNS zones.

ProVision offers multiple DNS zone import options, available under the Data Import tab in the Admin section. For more information on

importing DNS zones, see [Importing your Data](#) and [Import DNS Zones](#).

BIND Zone Import

- Imports using the named.conf configuration file tied to the zones you are uploading, a .zip or .tar file of the zones themselves, and an optional .csv file mapping zones to customers and DNS Servers.

PowerDNS Zone Import

- Option is available after configuring a PowerDNS server with a MySQL backend. Connects to the selected server and imports all zones.

InfoBlox Zone Import

- Imports DNS zones using a provided Host, Username, and Password. The InfoBlox import pulls all zones on the InfoBlox LOCAL grid and adds them to a designated Group. It is advised to [create a DNS Group](#) prior to the import with default parameters and NS records to be inherited by the imported records.

NS One Zone Import

- Imports DNS zones using a NS One API Key. It is advised to [create a DNS Group](#) prior to the import with default parameters and NS records to be inherited by the imported records.

Dyn DNS Zone Import

- Imports DNS zones using a Dyn DNS Customer Name, Username, and Password. It is advised to [create a DNS Group](#) prior to the import with default parameters and NS records to be inherited by the imported records.

DNSMadeEasy Zone Import

- Imports DNS zones using a DNSMadeEasy API Key and API Secret. It is advised to [create a DNS Group](#) prior to the import with default parameters and NS records to be inherited by the imported records.

Manually adding zones may be done at any time from the [DNS Tab](#). See [Working with DNS Zones - Common Tasks](#).

3) Add Users and Groups

In ProVision, the permissions structure is handled by assigning users to groups, then setting specific resource-level C/R/U/D permissions for that group. It is designed to give you as much flexibility as you need to accommodate most use cases. When mapping out the permissions structure for your organization, keep in mind who you want to access to application:

- Internal Users and Roles (Admins, Read Only, etc.)
- Partners related to multiple specific Resources/Accounts
- Customers/Departments with limited view to only their respective Resources/Accounts

See: [Users & Permissions](#), [Users and Groups](#)

Working In Provision

With the basic data now imported, and users set up, you (and your team) are ready to work in ProVision!

Refer to our [User Guide](#) and [Admin Guide](#) for details on standard user and admin level areas of ProVision. Or, follow the links below for additional details grouped by specific task areas:

Resource Concepts

The Resource System

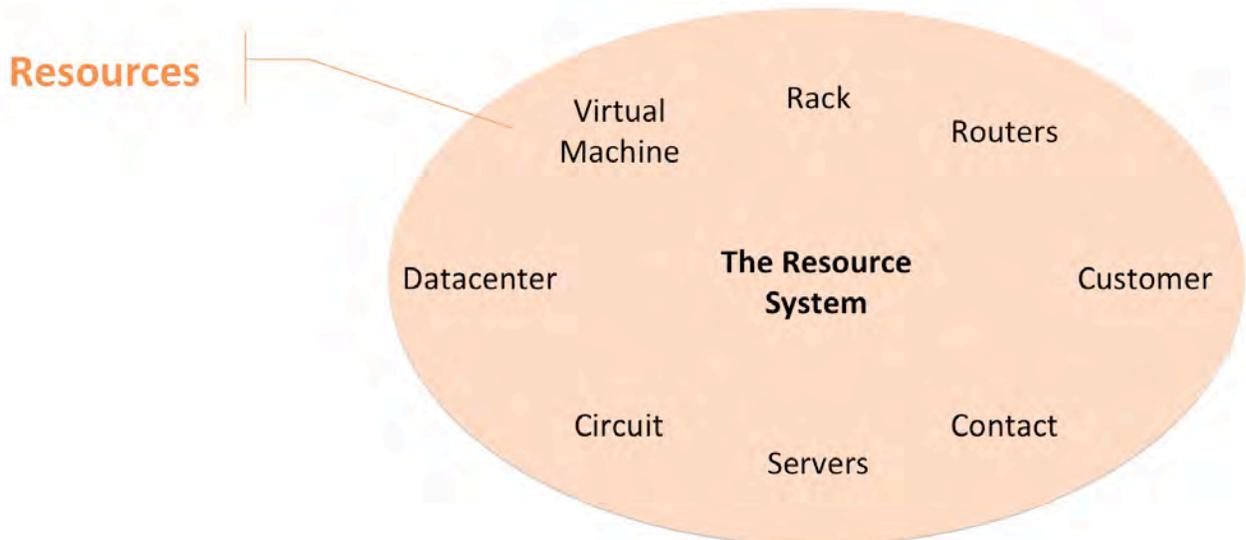

- The Resource System
 - Resource System Components
 - Resources
 - Section
 - Entry
 - Category
 - Resource Hierarchy
 - Additional Information:

Resource System Components

Resources

In ProVision, a “Resource” is simply an umbrella term for the components that you are tracking. Resources may be:

- Physical assets such as servers and routers
- Virtual assets such as DNS Zones or VMs
- Individual people or companies (customers)
- Places holding your assets, such as Datacenters

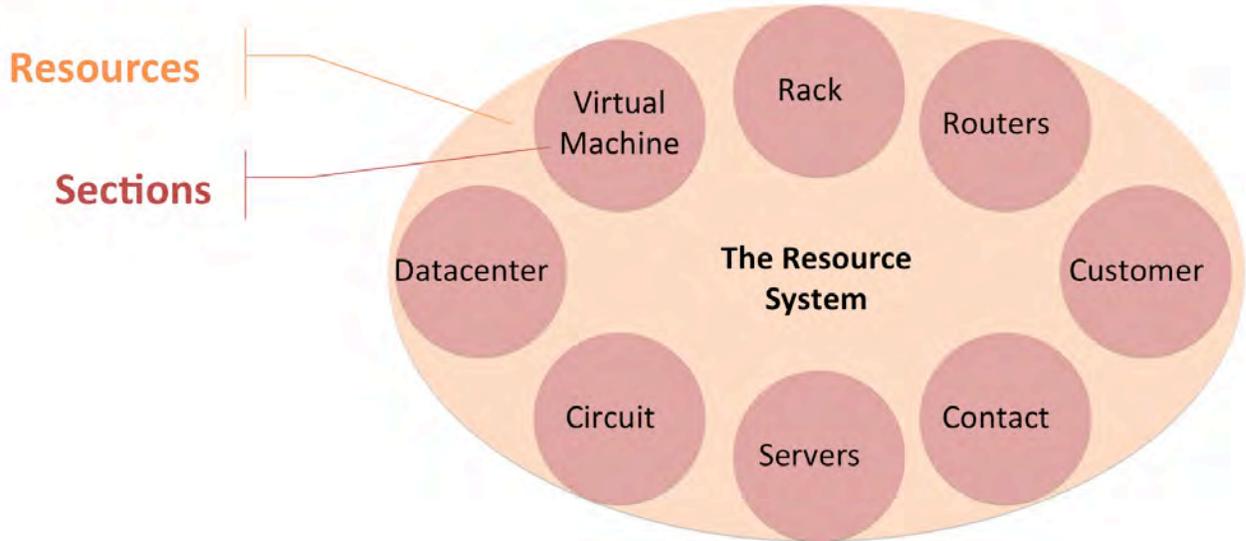

Section

The generic type of a resource is called a Section. General terms such as Rack, Routers, Customer, Servers, and Datacenters would be considered Sections in ProVision.

You might have an individual server named "Test Server", but its generic type of resource is that of a “Server” – so we would associate “Test Server” with the Section “Server”.

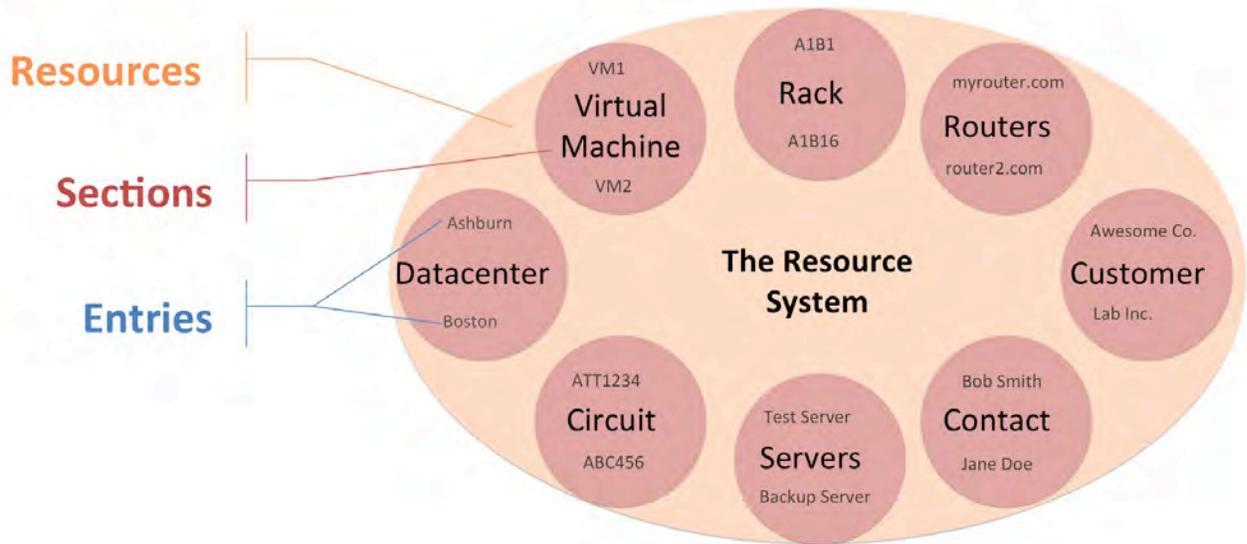

Think of Sections as templates for your resources. When a Section is created, you can associate specific [fields](#) and [gadgets](#) with that Section. In the case of our "Server" section, we would want to associate fields that are common server properties, such as Make, Model, Operating System, and Domain. Then, anytime we looked up a specific server in ProVision, we can see and update the Make, Model, OS, and Domain information.

Entry

Think of an Entry as the individual item you are tracking – it has a specific name, it might have an IP Address, a physical address, or additional descriptive data that is associated with it.

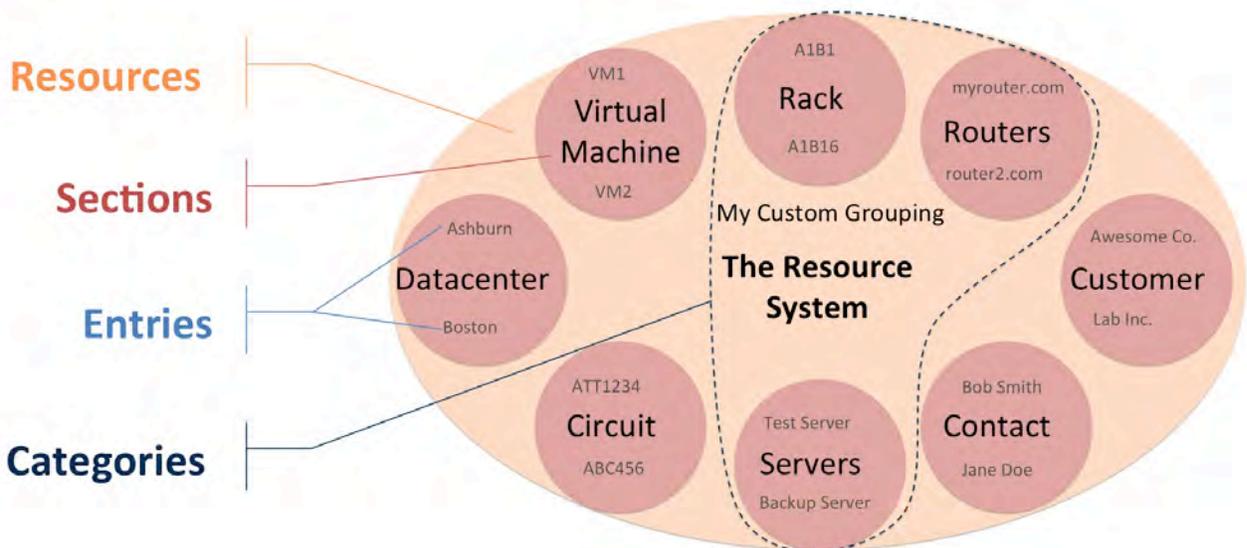

Our "Test Server" resource is an Entry under the "Server" Section.

Here, we can see that under the “Datacenter” section, we have two entries – one is the Ashburn Datacenter, the other is the Boston Datacenter. Under “Servers”, we have entries for “Test Server” and “Backup Server”.

Category

Another part of ProVision’s resource system is “Categories”. Categories allow you to group resources together under a name of your choosing to further organize your resources. A category that is often used is “Customer”, grouping customer resources together

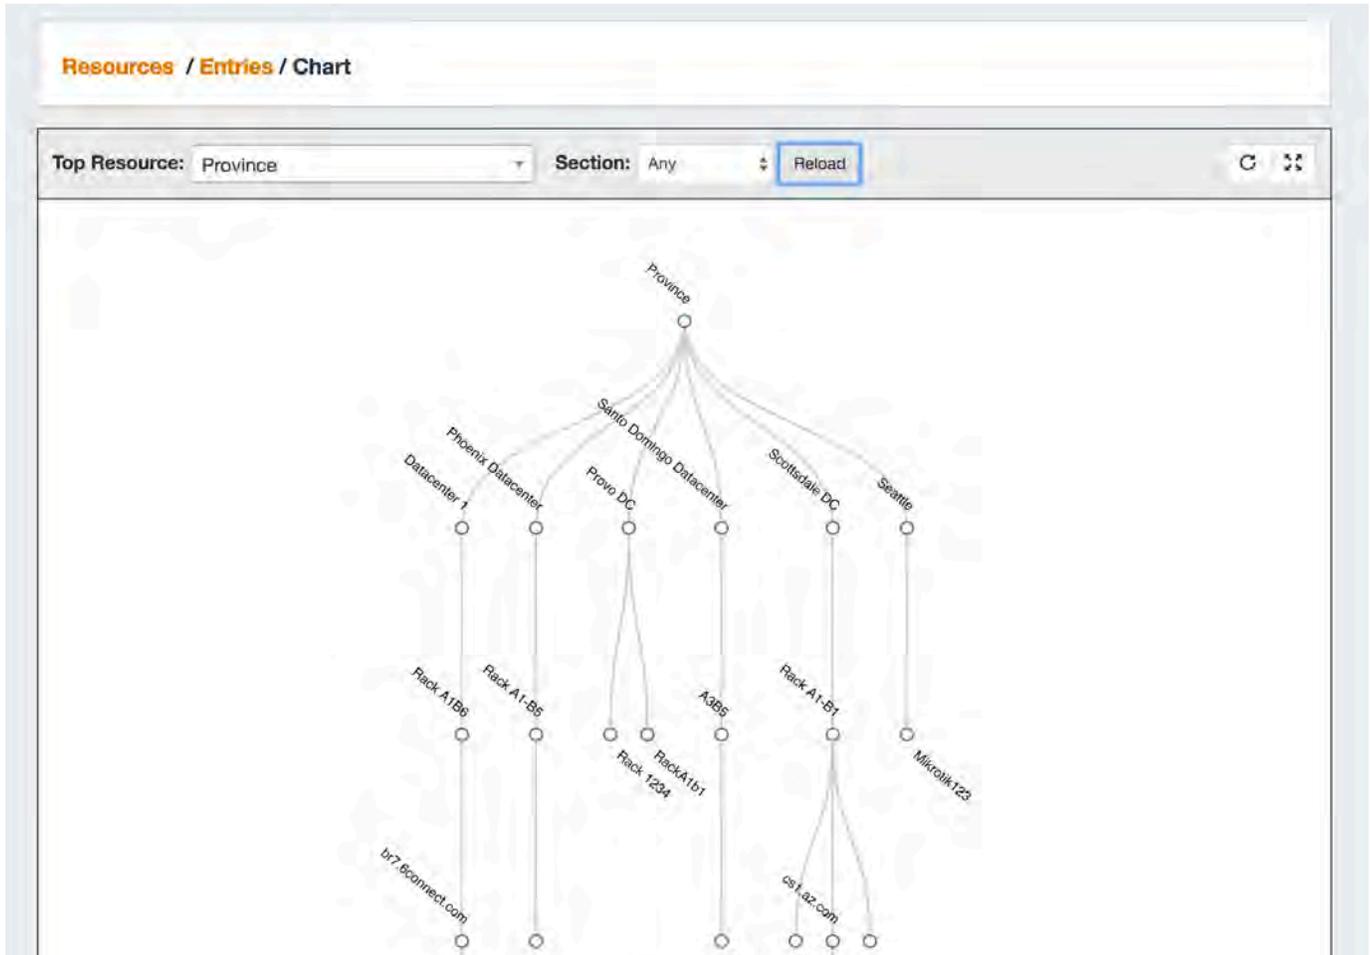

In this example, we are grouping Racks, Servers, and Routers under the “My Custom Grouping” Category.

Creating categories is entirely optional, so you can decide internally if the additional organization is needed in your instance.

Resource Hierarchy

In ProVision, "Child" Resources can be created underneath a "Parent" resource. This functionality allows for hierarchies to be created to match the desired organizational structure. An example of this would be to create racks and servers as children under a datacenter entry. [Chart View](#), available from the [Resources](#) Tab, lets you see this structure graphically.

The structure decided upon will influence how resources are set up in ProVision, as well as behaviors of functions while working with items such as IP Blocks or DNS zones.

Workflow Concepts

Workflow Concepts

- Workflow Concepts
 - IP Assignment Lifecycle
 - IP Management
 - Peering
 - VLAN Manager
 - Standard flow (without VLAN tags):
 - Optional flow (with VLAN tags):
 - DHCP
 - DNSv3 Workflow

IP Assignment Lifecycle

In ProVision, the IP assignment lifecycle starts with an available block which is free to be assigned to any IPAM-enabled resource holder. There are multiple methods that may be used to assign a block to a resource holder: Smart Assign, Direct Assign, or Manual Assign (Smart Browse). Once an IP block is assigned, blocks can be further subassigned via the same methods if desired. When an assigned block is un-assigned it proceeds into the Holding Tank: a special resource where blocks are held until either a set time has elapsed or until they are manually reclaimed to 'available' status.

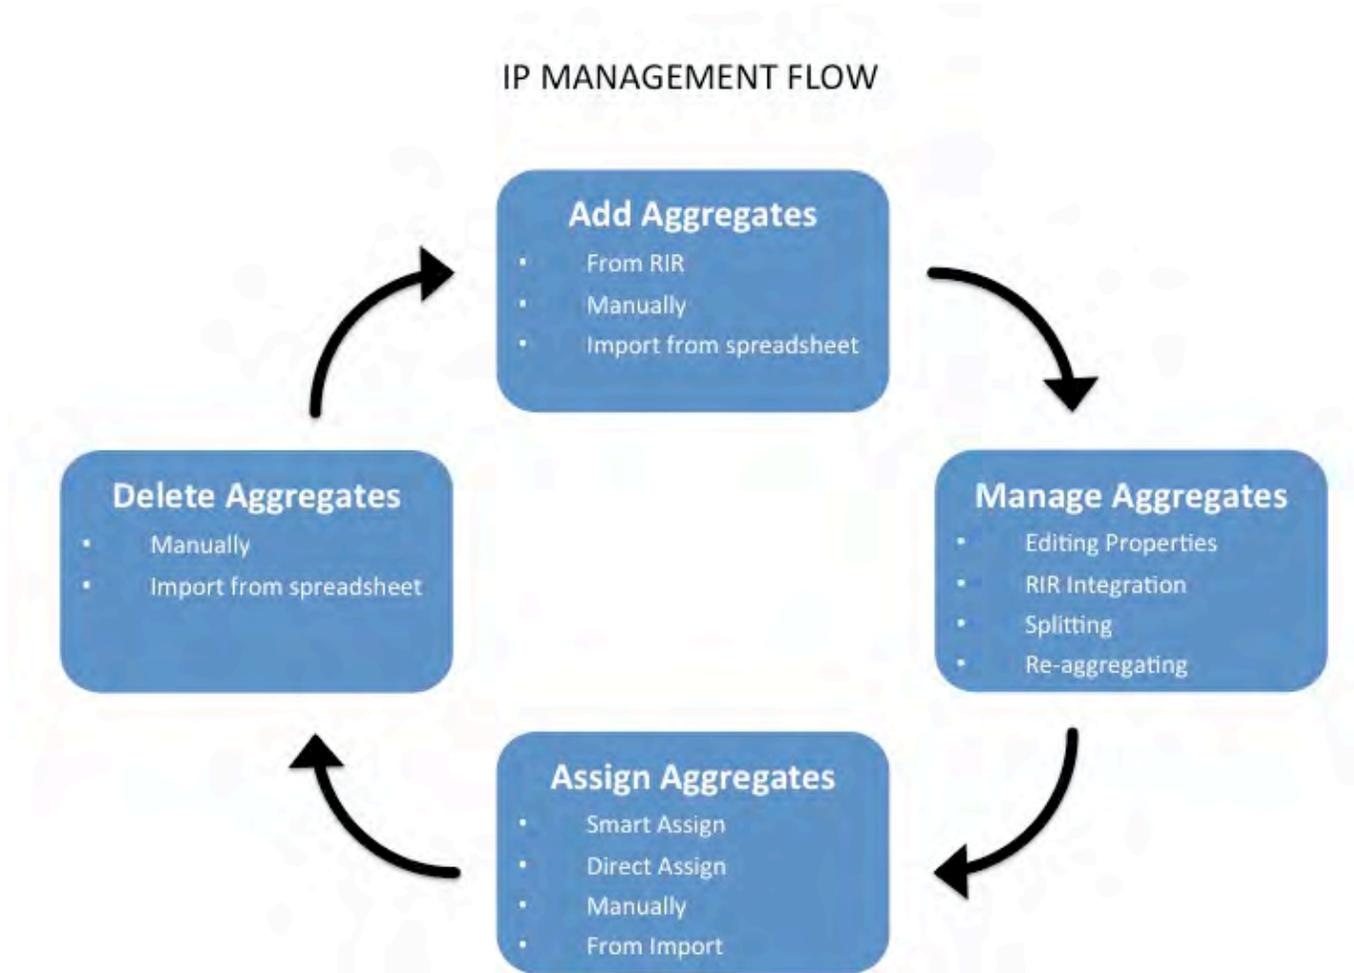

For more information on performing tasks in this IP Assignment Lifecycle, see the following documentation sections:

Working with IP Blocks

IP Management

IP Management is comprised of four basic functions: adding aggregates into ProVision, managing those aggregate blocks, assigning them to a resource, and deleting the aggregates.

ProVision provides multiple ways for you to achieve each step, depending on your needs. For example, if your organization currently uses spreadsheet data to track aggregates, ProVision provides tools that can import your existing spreadsheets for bulk updates, saving you time. Need to just quickly assign a single IP? Direct Assign will allow you to do so with just a few clicks.

For more information on performing tasks in this IP Management Flow, see the following documentation sections:

[Working with IP Blocks](#)

[IPAM Administration](#)

[Importing Your Data](#)

[Import Aggregate Blocks](#)

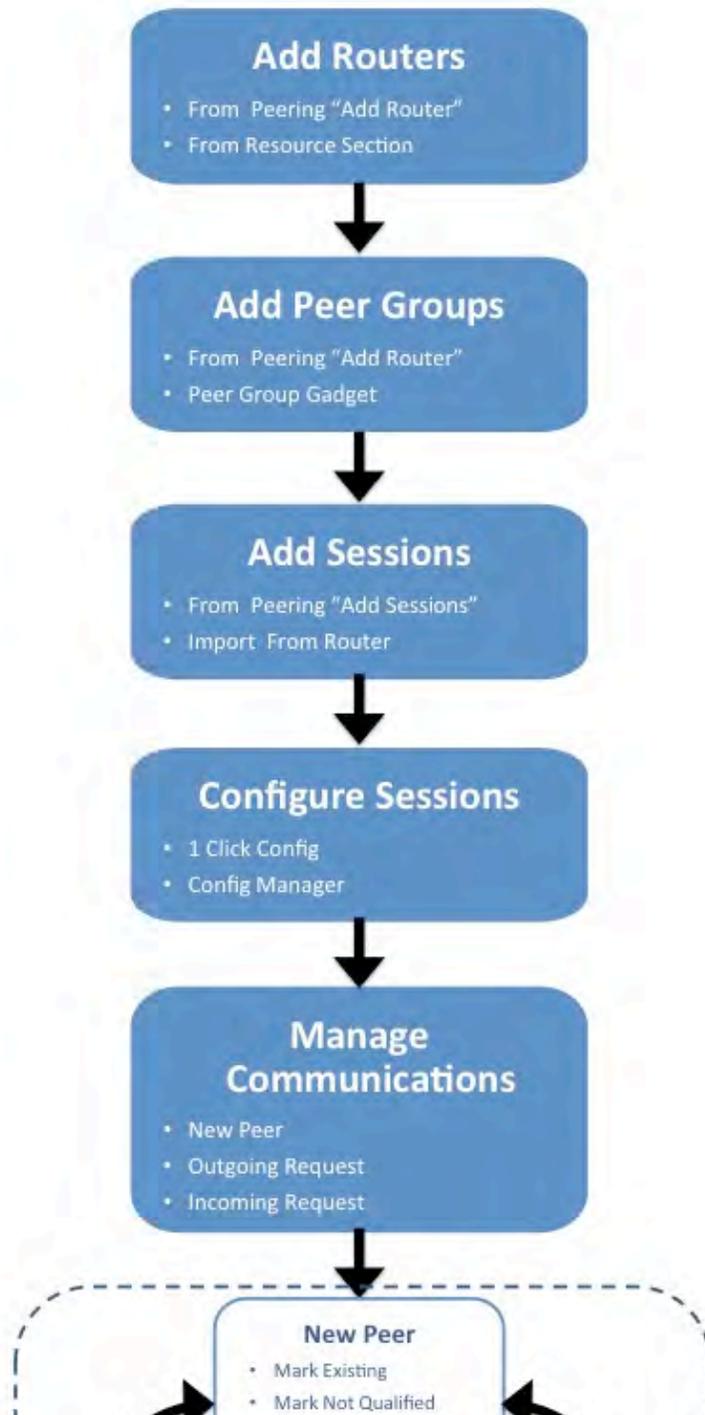

Peering

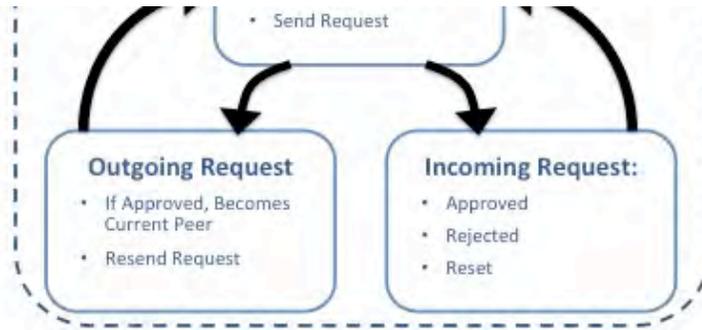

In ProVision, Peering starts with designating Routers. Routers may be added through the Resource system under a router Section, but the simpler approach is to add a new router via the "Add Router" button under the Peering Tab. Through this dialog, Peer Groups may be added at the same time.

After the router(s) and Peer Groups have been created in ProVision, Sessions need to be added. Sessions may be added manually through the "Add Session" dialog in the Peering tab, or Imported from a router (requires ProVision Admin permissions).

Once a session has been created, it can be configured and managed through the Sessions list, or selected and configured for a specific Peer via the Communications list "Configure Sessions" option. The Peer that is associated with the session is added to the Peer Communications list, where communications and status may be managed.

PEERING WORKFLOW

For more information on performing tasks under Peering, see the following documentation sections:

[Peering - Common Tasks](#)

[Add Routers](#)

[Add Sessions](#)

[Import Sessions](#)

[Managing Peer Sessions](#)

[Managing Peer Communications](#)

VLAN Manager

The VLAN Manager allows Admin users to add domains and VLANs to their ProVision instance, and associate them with IP Blocks. Optionally, VLAN tags may be associate with ranges or individual VLANs under a domain, to help limit VLAN search results when enabling VLANs.

Standard flow (without VLAN tags):

The workflow starts with creating a domain in the VLAN Admin section of ProVision. During creation, domains may be selected as "standard" or "extended" domains, declaring the size of the VLAN pool from which VLANs are available to be enabled. Next, VLANs must be enabled and added to the domain. This is done under the IPAM Tab -> VLAN section of ProVision. Add VLANs to the domains by clicking "Add", searching for the desired range of VLANs to enable from the standard / extended pool, and selecting the desired VLANs to enable. Once enabled, VLANs may be edited or have IP blocks associated with that VLAN. Editing VLANs and Direct / Smart Browse / Search IPs functions for adding blocks to VLANs are available from the Domain/ VLAN list under under the IPAM Tab -> VLAN section of ProVision by expanding the desired domain and clicking on the VLAN link. IP blocks may also be edited individually through the IPAM gadget, IPAM Manage, and VLAN Manage areas to add domain and VLAN information to the block.

Optional flow (with VLAN tags):

The workflow starts with creating a domain in the VLAN Admin section of ProVision. During creation, domains may be selected as "standard" or "extended" domains, declaring the size of the VLAN pool from which VLANs are available to be enabled. VLAN tags may be added (from the VLAN Admin Tab -> Edit Tags submenu) before or after domain creation. Tags created in this area are available to all domains and VLANs.

If the tags created need to be added to a large range of VLANs, the next step would be to add tags to the desired range(s) of VLANs from the VLAN Admin -> Domain "Manage" button. Domain Manage allows you to select an existing tag, type in the numeric VLAN start and end point, and assign that tag to that entire range of VLANs under the current domain.

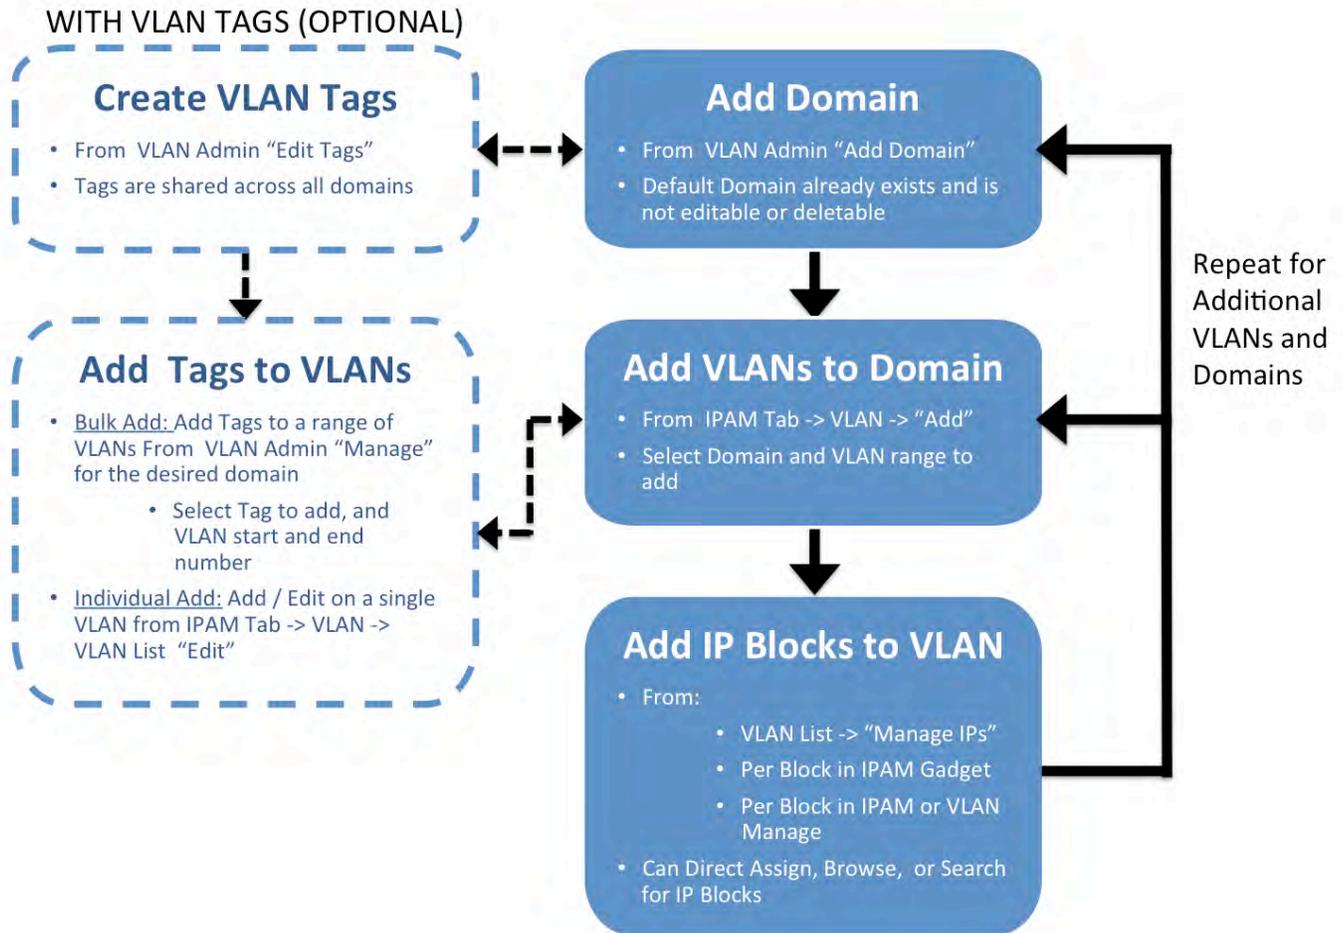

Once a bulk range of tags is associated with VLANs, you can use the tag as a search criteria when adding VLANs to a domain. This is done under the IPAM Tab -> VLAN section of ProVision. Add VLANs to the domains by clicking "Add", using the tag name as a search field for the desired range of VLANs, and then selecting the desired VLANs to enable.

If tags are only desired for individual VLANs, they may be added when editing a VLAN after the VLAN has already been added/enabled for the domain. Editing VLANs may be accessed from the IPAM Tab -> VLAN section, then expanding the desired domain and clicking on the VLAN link, selecting "Edit".

Next, VLANs must be enabled and added to the domain. This is done under the IPAM Tab -> VLAN section of ProVision. Add VLANs to the domains by clicking "Add", searching for the desired range of VLANs to enable from the standard / extended pool, and selecting the desired

VLANs to enable. Once enabled, VLANs may be edited or have IP blocks associated with that VLAN. Editing VLANs and Direct / Smart Browse / Search IPs functions for adding blocks to VLANs are available from the Domain/ VLAN list under under the IPAM Tab -> VLAN section of ProVision. IP blocks may also be edited individually through the IPAM gadget, IPAM Manage, and VLAN Manage areas to add domain and VLAN information to the block.

VLAN MANAGER WORKFLOW

DHCP

The DHCP Workflow in ProVision begins with denoting the DHCP IP Aggregate(s) from the IPAM Tab -> "Add Aggregate". When creating DHCP aggregates, ensure that the block is designated as 1918 space, and has the check boxes next to "DHCP Aggregate" and "Allow Sub-assignment" selected. This will ensure the block is automatically added to the DHCP Available Resource, and is usable when defining DHCP Pools.

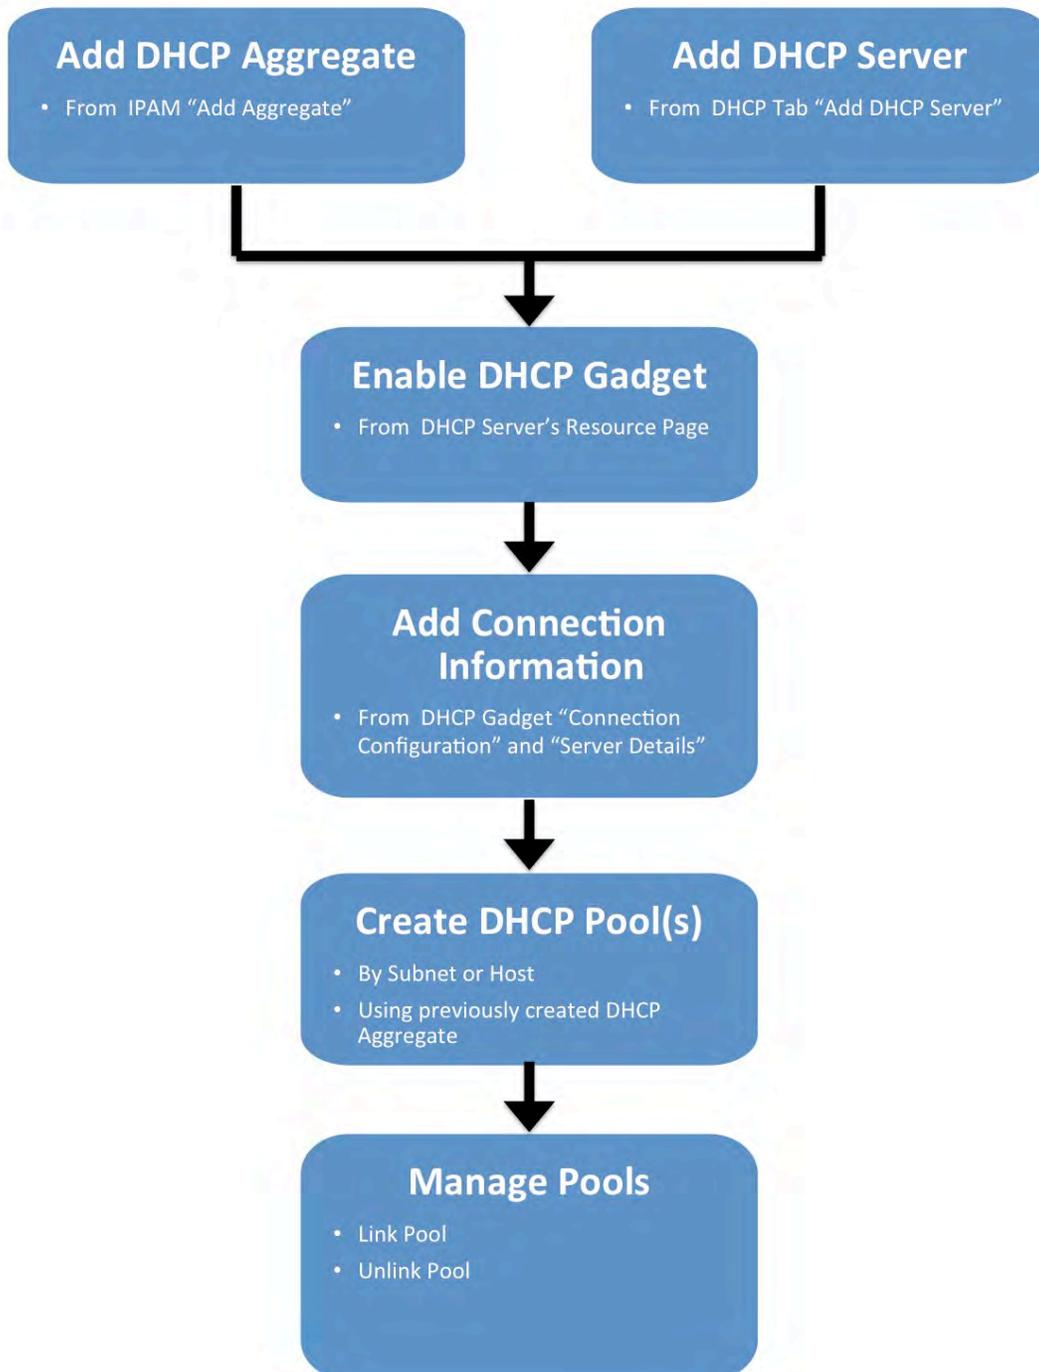

Separately, ensure that the DHCP server is added into ProVision. New DHCP servers may be added from the DHCP Tab "Add DHCP Server" button. Type the server name, then choose the resource to which the DHCP server belongs. This creates a hierarchical relationship, with the server as a child resource under the selected parent.

Once the server has been created in ProVision, click on the server name in the DHCP server list to go to the server's Entry Page. If the server was created through the DHCP Tab, the DHCP Management Gadget will already be enabled for the DHCP server. If created elsewhere, the DHCP Gadget may need to be enabled by simply selecting the "On" radio toggle next to "DHCP Services", and clicking the "Update" button. Next, add in the connection configuration and server details for the DHCP server in the DHCP Gadget.

Now that the DHCP server is set up and DHCP aggregates created, DHCP Pools may be created and managed. Pools may be created by subnet or host. Creating by subnet allows for a block to either be directly assigned manually, or for ProVision to SmartAssign a block based on the

provided criteria. Creating by host requires providing a host and MAC address, and then likewise may have an IP directly assigned or Smart Assigned. DHCP Pools, once created, are managed by linking or unlinking to the DHCP server. IP assignments and pool details may be changed at any time by clicking on the pool name, editing the details as desired, then clicking "Save".

DHCP WORKFLOW

For more information on working with DHCP in ProVision, see the [DHCP Tab](#) documentation.

DNSv3 Workflow

DNSv3 revolves around Groups. Zones are gathered under Groups, servers attached to Groups, and pushes may be done on a per Group level. Thus, the first workflow step in DNSv3 is to set up one or more DNS Groups. A "Default Group" is automatically provided in ProVision, but other Groups may be desired to organize zones and default values.

To create a new DNS Group, click the "Add Group" button from the **DNS Groups** tab. Enter the desired default values for the Group, and save. If only using the Default Group, ensure the default parameter values are set as needed. For more information, see [Working with DNS Groups](#).

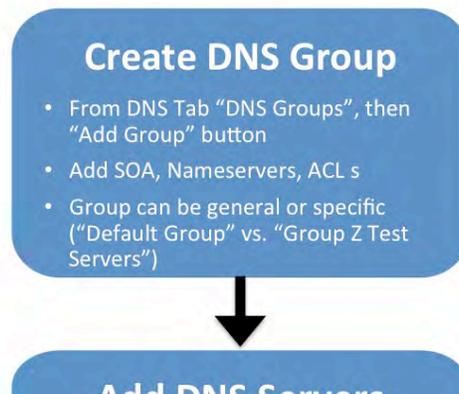

After Groups have been set up, DNS servers should be added or settings verified. Admin users may add DNS servers from the **DNS Servers** tab "Add Server" button. Input the server information and save. Existing servers may be reviewed and edited by clicking on the server name in the DNS Server List. Once a server is created in ProVision, it may be attached to any DNS Group under the Group's "Attached Servers" module. Attaching a server to a Group will allow for zones in that group to be pushed to the attached server(s). See [Working with DNS Servers](#).

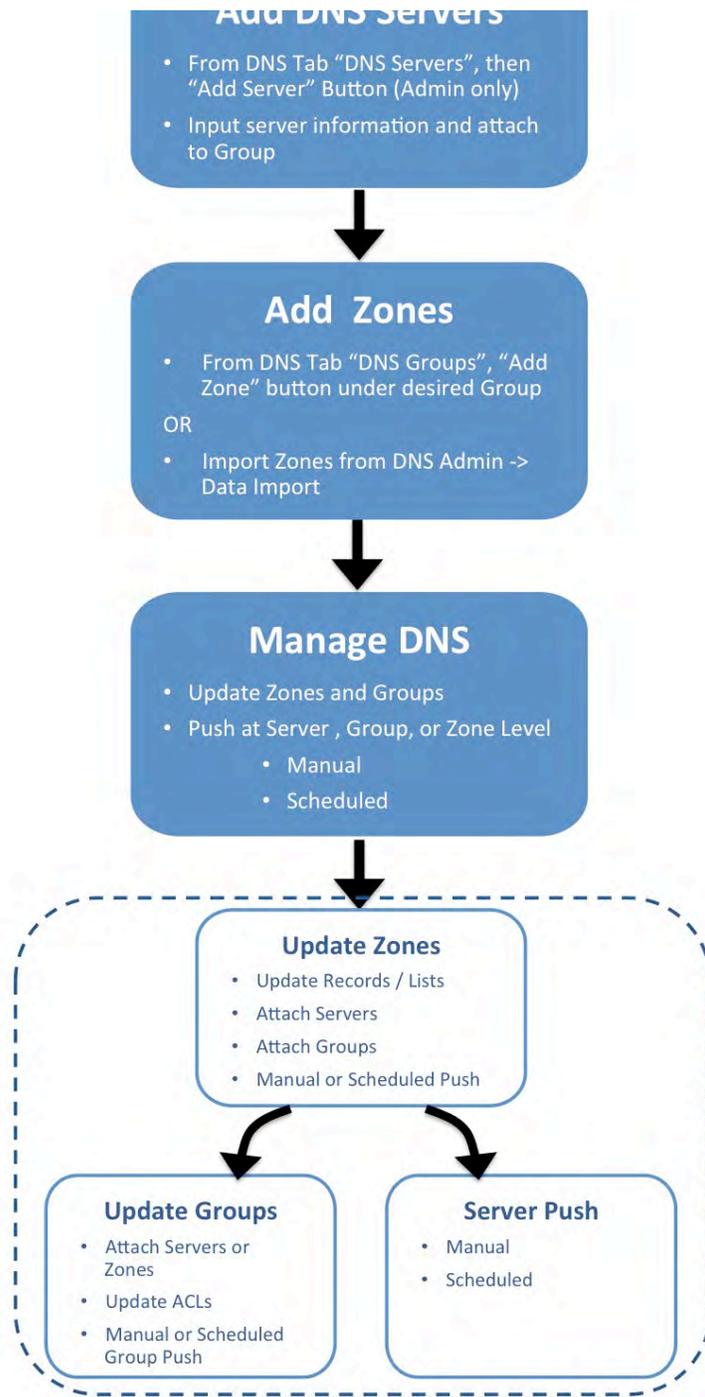

Next, add zones to your groups. Zones may be manually added under each group by clicking the "Add Zone" button, or it may be imported via [DNS Importers](#) into a selected Group. Add the zone and record information, and save. See [Working with DNS Zones - Common Tasks](#) for additional information.

Zones may only exist once per Group, but may be duplicated under multiple Groups. Zones may also be moved from Group to Group as needed.

At this point, all major components of the ProVision DNS system have been added - from here management tasks take over. Zones may be updated and moved to or from Groups; Groups may be edited with different default values or servers, and pushes maybe be performed for an individual zone, a full Group, or for an entire server. Pushes may be manual or scheduled for a future time through the Scheduler.

DNS WORKFLOW

Import DNS Zones

UI Element Legend

Common Icons

While working in ProVision, you will come across a number of icons regularly used to denote status, or with which you can interact to perform tasks. Here is a brief legend to help orient you to the most common icons you'll encounter.

Interactive Icons:

Action Menu (Wrench Icon):

The Action Menu is used throughout ProVision to perform actions on individual items. Clicking on the wrench will bring up a menu of tasks specific to that item, such as "Edit", "View", "Delete", "Reassign", and so on.

"Add" Button

Clicking on the Add button will open a menu to add a new entry to the page, such as adding an aggregate or adding a zone.

Red "No Entry" Button

In its interactive state, the red "No Entry" button may be used in ProVision to delete an entry. Clicking on the button will expand a menu with delete confirmation options.

Status Icons:

Green Check:

The green check indicates a successful result or enabled option. In Peering, it indicates that the entry is a current Peer.

Yellow "Warning" Exclamation:

Indicates an unsuccessful result followed by a description.

Red "No Entry" Button (Status):

In Peering, the red "No Entry" status indicates a peer that has been marked "Not Qualified".

ProVision User Guide

User Guide

The ProVision User Guide provides information on features accessible in the standard user tabs within ProVision. For more detailed information on features accessible with Admin permissions, see the [ProVision Admin Guide](#).

Table of Contents

The Dashboard

The Dashboard

The Dashboard is your first stop when logging into 6connect Provision, giving you a quick graphical status overview as well as convenient links for reference and support. The Dashboard is comprised of modular "Widgets" that show different types of information. These Widgets may be added, moved, edited, and customized to create personalized Dashboards.

There are two levels of Dashboards:

Default Dashboard: The Default Dashboard is a shared dashboard for all users of the ProVision instance. It may only be edited by admin level users, but it is viewable by all users.

Individual Users' Dashboards: Additional Dashboards may be created by individual users. These dashboards are tied to the user logged in, and are only viewable / editable by that user.

Dashboards and Permissions

Note: An individual's permission levels may limit what that user can view in both default and personal Dashboards. Although all users can view the Default Dashboard, they may be not be able to view all elements or data inside the dashboard.

- The Dashboard
 - ProVision Default Dashboard Overview:

 - 6connect Professional Services: (iFrame Widget)
 - 6connect Links (Links Widget):
 - 6connect RSS (RSS Feed Widget):

ProVision Default Dashboard Overview:

Although each user may have access to or create wildly differing dashboards, below are descriptions of the Widgets available shown on the ProVision Default Dashboard (from left to right):

Activity Chart (Viewable by Admins Only):

Illustrates activity level for API, IPAM, DNS, Peering, and Resource areas of ProVision.

Select the desired ProVision area by clicking on the radio buttons. Then, hover over the chart, and use the mouse scroll wheel to zoom in or out of specific date / times. Clicking on a bubble will show activity detail, and resource / IP block links if applicable.

Only one Activity Chart Widget may exist on a dashboard.

IP Charts:

Illustrates the percentage of assigned

vs unassigned hosts for 1918 / IPv4 / IPv6 space out of the total available hosts in ProVison viewable by the user.

Only one IP Charts Widget may exist on a dashboard.

Clock:

Shows the current time and date for the selected time zone, based on format set by the user.

Multiple Clock Widgets may exist on a dashboard.

Status:

General status information on number of user / admin accounts, ProVison version number, and a 'Coming Soon' link to the future releases roadmap in the the documentation.

Only one Status Widget may exist on a dashboard.

Resource Tree:

An interactive horizontal or vertical treeview of a selected Resource and its children. Select a top-level resource from the Widget's Edit menu. Users may click and drag to move within the Widget, as well as zoom in and out using a scroll wheel. Clicking on filled dots will expand the tree to show the children of that resource. Double-clicking on a resource in the tree will give you the option to navigate to the resource's entry page.

Multiple Resource Tree Widgets may exist on a dashboard.

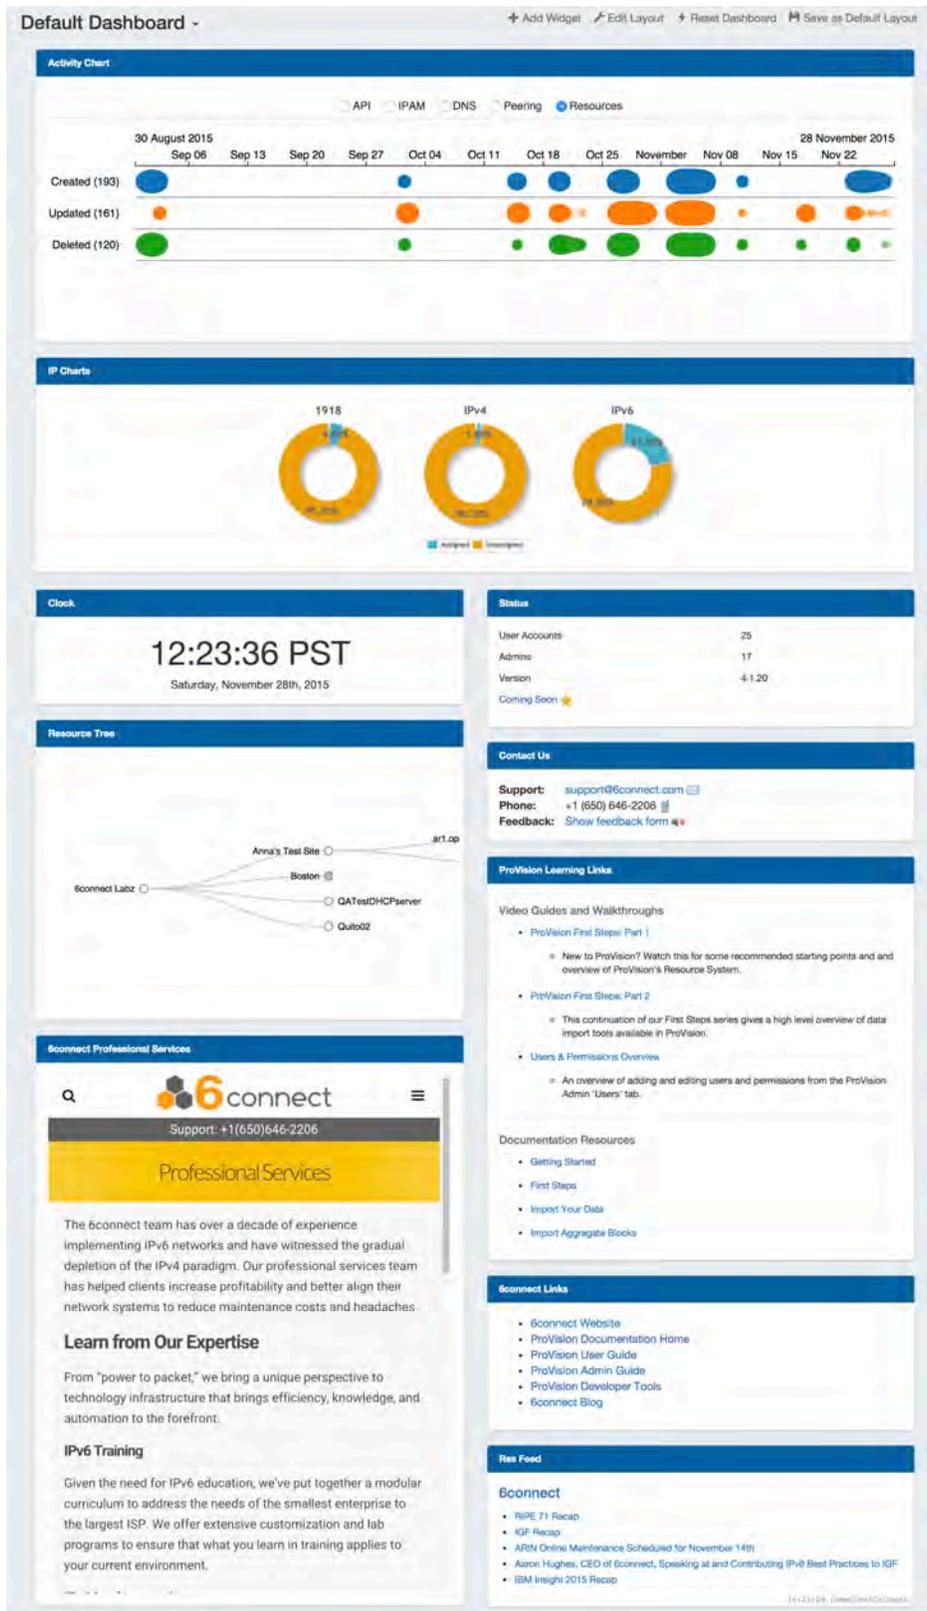

Contact Us:

Provides support email, phone, and feedback form information. Support phone number and email address are set from the ProVison Admin settings. The feedback form email address is editable within the Widget.

Only one Contact Us Widget may exist on a dashboard.

ProVison Learning Links: (Markdown Widget)

Pre-created Markdown Widget containing links to commonly

referenced ProVision documentation sections, video guides, and walkthroughs.

The Markdown Widget is a blank slate where users may add links, text, or other content through use of the Markdown language.

Multiple Markdown Widgets may exist on a dashboard.

6connect Professional Services: (iFrame Widget)

Pre-created iFrame Widget accessing the 6connect Professional Services website.

The iFrame Widget sets a [https](#) URL to be viewed in an iFrame, to view stats or commonly referenced websites.

Multiple iFrame Widgets may exist on a dashboard.

6connect Links (Links Widget):

Pre-created Links Widget listing 6connect ProVision company and documentation links.

Link URL and display may be set from within the Widget.

Multiple Links Widgets may exist on a dashboard.

6connect RSS (RSS Feed Widget):

Pre-created RSS Feed Widget accessing the 6connect Blog RSS.

Shows the most recent five entries of a selected [https](#) RSS Feed. Feed links open in a new window when clicked.

Multiple RSS Feed Widgets may exist on a dashboard.

Customizing the Dashboard

Dashboard Customization

The Dashboard is your first stop when logging into 6connect Provision, giving you a quick graphical status overview as well as convenient links for reference and support. The Dashboard is comprised of modular "Widgets" that show different types of information. These Widgets may be added, moved, edited, and customized to create personalized Dashboards.

There are two levels of Dashboards:

Default Dashboard: The Default Dashboard is a shared dashboard for all users of the ProVision instance. It may only be edited by admin level users, but it is viewable by all users.

Individual Users' Dashboards: Additional personal dashboards may be created by individual users. These dashboards are tied to the user logged in, and are only viewable / editable by that user.

Dashboards and Permissions

Note: An individual's permission levels may limit what that user can view in both default and personal Dashboards. Although all users can view the Default Dashboard, they may be not be able to view all elements or data inside the dashboard.

Browser Compatibility

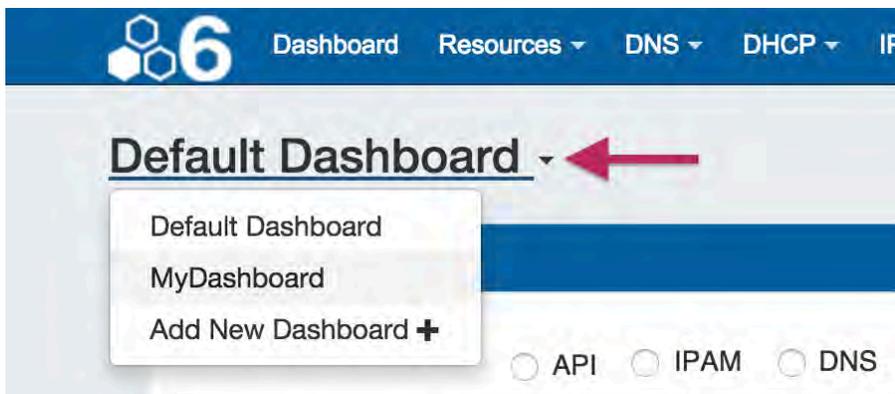

It is recommended to use the most recent versions of the Chrome or Firefox browsers when working with the dashboard. Due to incompatibilities with Internet Explorer, the dashboard is set to read-only mode and is not editable when accessed from IE at this time.

- Dashboard Customization
- Working with Dashboards
 - Viewing an Existing Dashboard
 - Adding a Dashboard
 - Editing a Dashboard
 - To Edit the Page Layout:
 - To Edit the Location of Individual Widgets:
 - Saving a Dashboard
 - Deleting a Dashboard
 - Reset the Default Dashboard
- Next Step: Widgets

Working with Dashboards

Viewing an Existing Dashboard

The Default Dashboard will be the primary dashboard that appears when clicking on the [Dashboard](#) Tab. To view another, already created dashboard, click on the dashboard name at the top left of the Dashboard page. This will open the list of existing dashboards. From there, click on the name of the dashboard you wish to view.

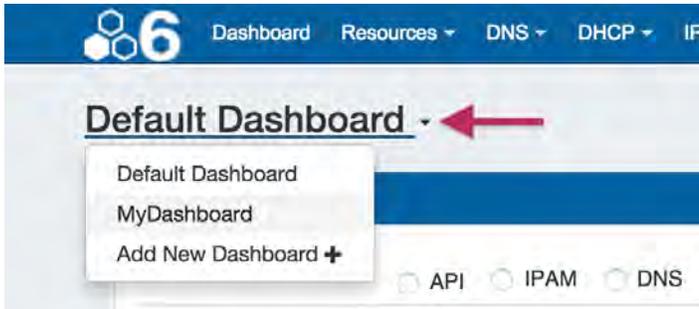

Adding a Dashboard

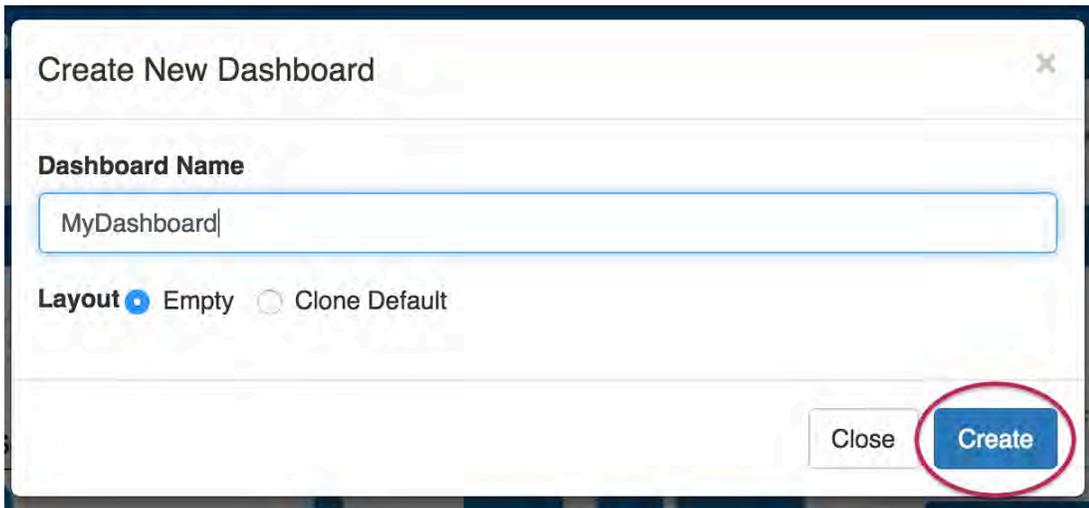

To add a new personal dashboard, click on the dashboard name at the top left of the Dashboard page. This will open the list of existing

dashboards.

Click on "Add New Dashboard"

Fill out the desired dashboard name, and choose whether the dashboard will be empty or cloned from the default dashboard. Selecting "Empty" will provide a (mostly) blank canvas for selecting and placing Widgets from scratch; selecting "Clone" will duplicate the current state of the Default Dashboard, which the user can then edit as desired.

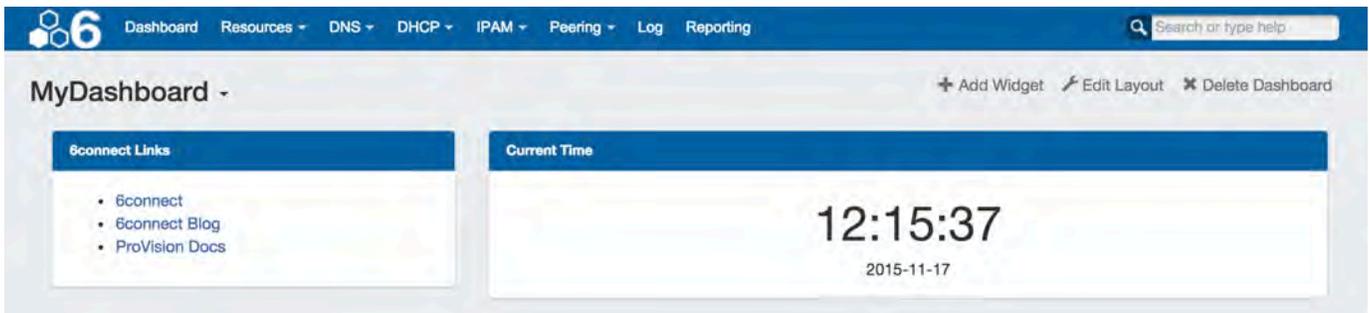

Note

Note: If "Empty" is selected, a default Widget will still show in the head of each page column, this is to assist in both visualizing the current page layout and to aid in placing new Widgets. These widgets may be edited or deleted as desired during the process of selecting layout and adding other Widgets.

For best performance of the dashboard, ensure that at least one Widget is placed in each column, or columns may be difficult to "detect" when moving Widgets to different page areas.

MyDashboard has now been created as an "Empty" dashboard, is accessible from the dropdown list of dashboards, and is ready to set up!

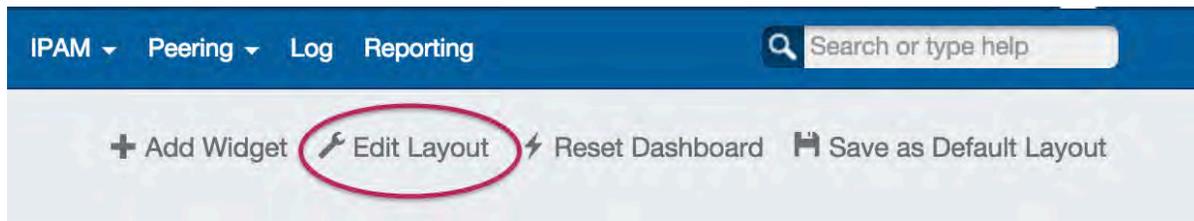

Editing a Dashboard

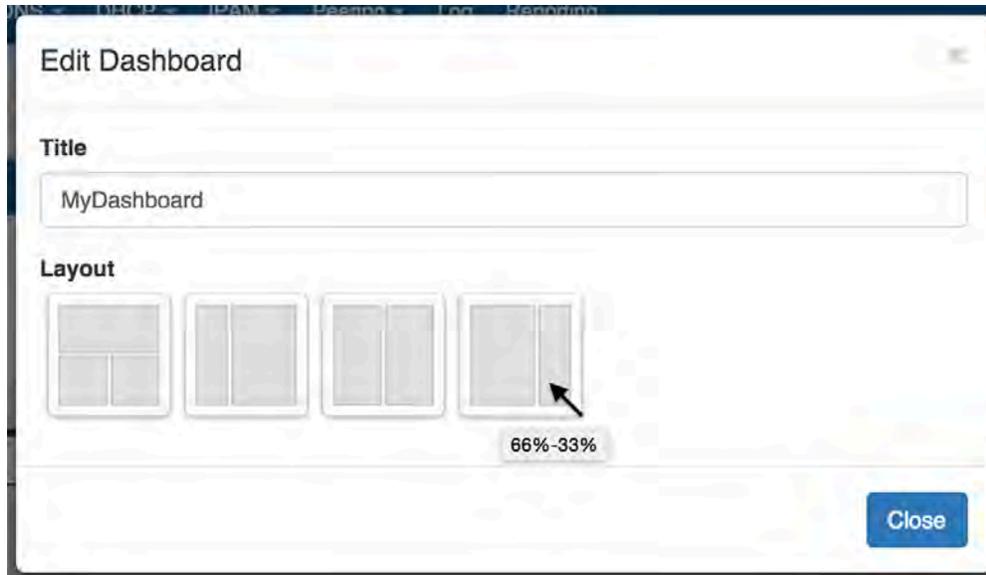

You can change the layout of your dashboard by selecting overall page layout options (for column size and location on the page), as well as move individual widgets around the page.

To Edit the Page Layout:

At the top of the page, click "Edit Layout".

This will bring up an option box where you can choose to rename your dashboard, and / or select a column organization structure.

Title: Type in how you want your dashboard title to display.

Layout: Click on a layout option to immediately apply that layout to your dashboard. Hovering over the option will show the column width percentages.

100% / (50% / 50%): Creates a page with a full width section at the top, and two equal sized columns below that.

33% / 66%: Creates a page with two columns, with the left column being one-third of the page width, and the right column as two-thirds of the page width.

50% / 50%: Creates a page with two equal sized columns, split down the middle.

66% / 33%: Creates a page with two columns, with the left column as two-thirds of the page width, and the right column as one-third of the page width.

To Edit the Location of Individual Widgets:

Individual Widgets may be moved around the page by clicking and dragging on the "Move" icon on the right side of the Widget header.

While mousing over the move icon, when the cursor changes to a hand icon, click and hold your left mouse button, then drag the widget up or down to the desired location. To move the Widget to another column, drag the widget sideways to the column, then up to briefly hover over a Widget already in the desired column (this "selects" the column for the Widget). Then, drop the Widget in the desired location in that column.

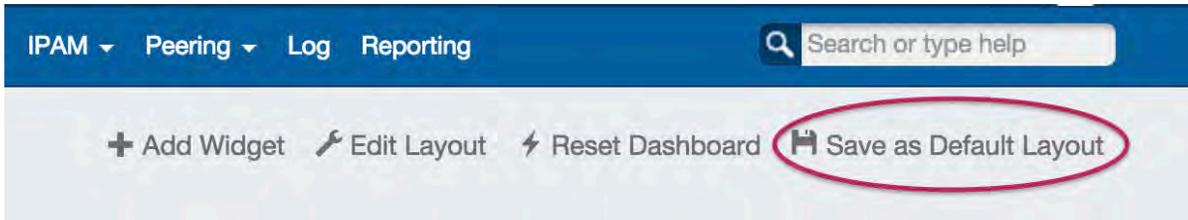

Saving a Dashboard

Personal dashboards are automatically saved after making layout or Widget edits (the exception is that Widget resizing must be manually saved -see [Working with Dashboard Widgets](#)).

Default Dashboards must be manually saved after edits for those changes to apply to all dashboard users.

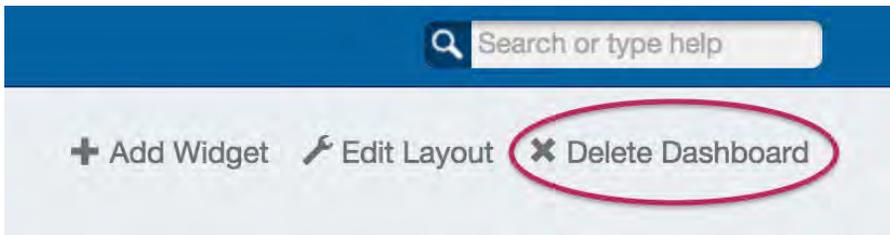

Admin users can save Default Dashboard changes by clicking "Save as Default Layout" at the top right section of the dashboard page, and the

changes will be applied for all users.

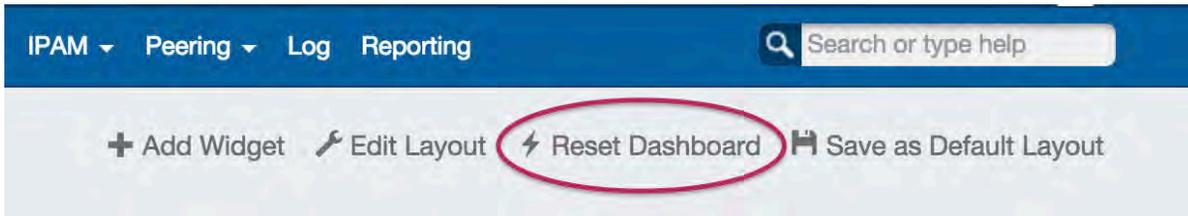

Deleting a Dashboard

Personal dashboards may be deleted by clicking the "Delete Dashboard" button at the top right of the page. Default Dashboards may not be deleted.

Reset the Default Dashboard

The Default Dashboard may be reset to the ProVision default dashboard by clicking "Reset Dashboard". This will remove any admin changes, and set the Default dashboard to its original state. This action may only be made by admin users.

Next Step: Widgets

Continue on to [Working with Dashboard Widgets](#) for information on each Widget, as well as how to add, move, update, and delete individual Widgets.

- [Working with Dashboard Widgets](#)

Working with Dashboard Widgets

Dashboard Widgets

The previous section, [Customizing the Dashboard](#), gave a high level overview of the dashboard types, how to create new personal dashboards, edit the dashboard layout, and remove personal dashboards. This section will give an overview of how to work with individual Widgets, and options available in each Widget type.

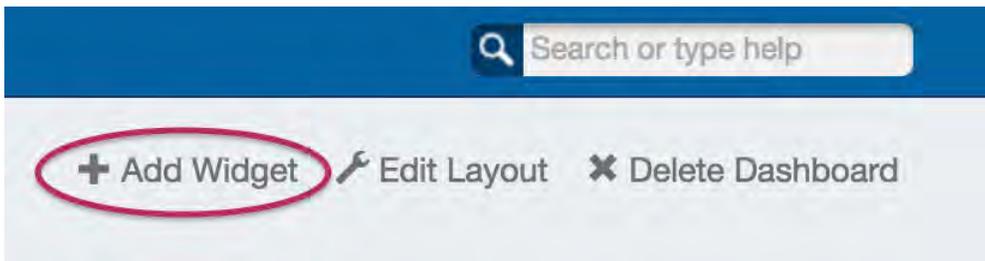

Before you begin working with individual Widgets, make sure that you have reviewed the information contained in [Customizing the Dashboard](#) and are familiar with the tasks outlined there.

Working with Widgets

Adding Dashboard Widgets

To add a widget to personalize your dashboard, click on the "Add Widget" button at the top of the page.

Then, click on the name of the Widget you want to appear on your page. It will automatically be added into the leftmost column of your page.

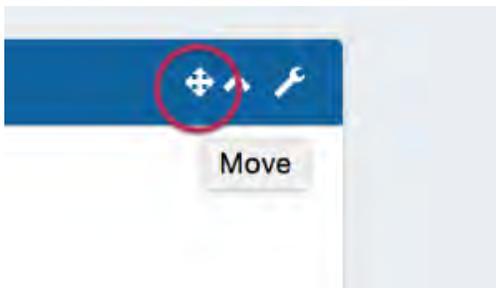

Some Widgets may only have one instance per dashboard, whereas other Widgets may be able to have multiple instances per dashboard. The Add New Widget dialog will only show you the widgets you have available to add.

For detailed information on each individual Widget, view the [Available Widgets](#) section on this page.

Move a Widget:

Individual Widgets may be moved around the page by clicking and dragging on the "Move" icon on the right side of the Widget header.

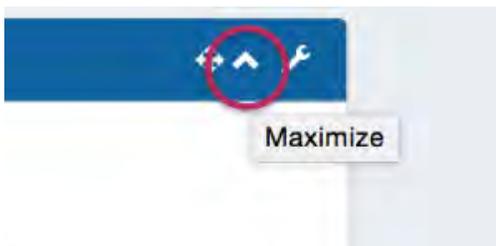

While mousing over the move icon (when the cursor changes to a hand icon) click and hold your left mouse button, then drag the widget up or down to the desired location.

To move the Widget to another column, drag the widget sideways to the column, then up to briefly hover over a Widget already in the desired column (this "selects" the column for the Widget). Then, drop the Widget in the desired location in that column.

Maximize / Pop-Out a Widget:

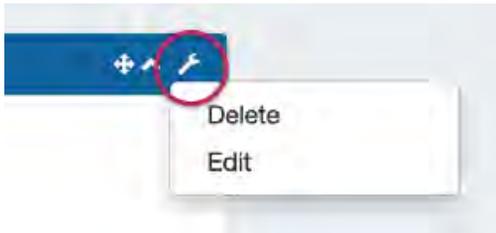

Widgets can temporarily be viewed at a larger size by hitting the "Maximize" icon on the Widget header. This will "pop out" the widget information to a larger page size for easier viewing.

While maximized, you may interact with the widget as normal. When done, hit the "Close" button.

Edit a Widget (Widget Action Menu):

To open the edit menu for a widget, click on the Action Menu (wrench icon) on the right side of the Widget header. A drop down menu will appear with some of the following options:

Edit: Opens an edit widget pop up, where widget-specific options may be changed. Options may include changing the title, links, applicable resources, and so forth depending on the particular Widget.

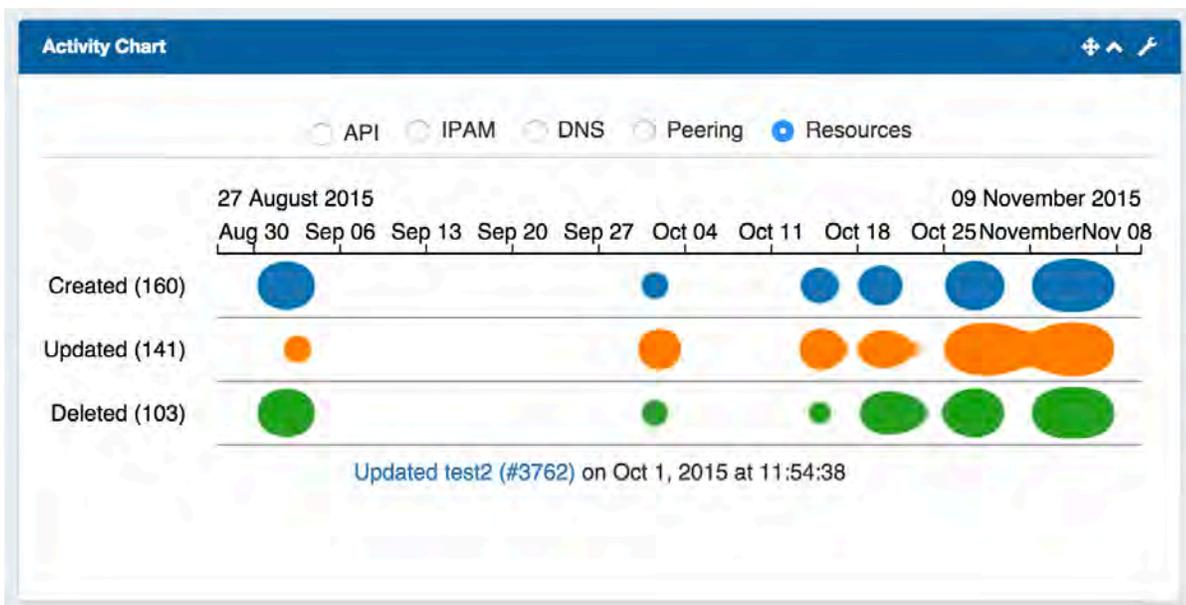

Resize: For Widgets able to be resized vertically, brings up a draggable black bar at the bottom of the widget. Drag the bar up or down to the desired widget height, then select the Action Menu again and click on "Save Resize" to save and complete the size edit.

Save Resize: Available only after the "Resize" action has been used. After resizing a Widget, selecting the Action Menu again and clicking on "Save Resize" will save the Widget size.

Delete: Deletes the widget.

Available Widgets

Activity Chart (Admin only)

Illustrates activity level for API, IPAM, DNS, Peering, and Resource areas of ProVision. The Activity Chart is only visible to Admin users. Only one Activity Chart Widget may exist on a dashboard.

Activity Chart Actions:

Radio Buttons: Select the desired ProVision activity area to view by clicking on the radio buttons (API, IPAM, DNS, Peering, or Resources).

Chart: While hovering over the chart, you can:

Use the Scroll Wheel to zoom in or out of the date/time detail level

Double click to zoom into the next date/time detail level

Click & Drag left or right to move to an earlier or later date/time at the current zoom level

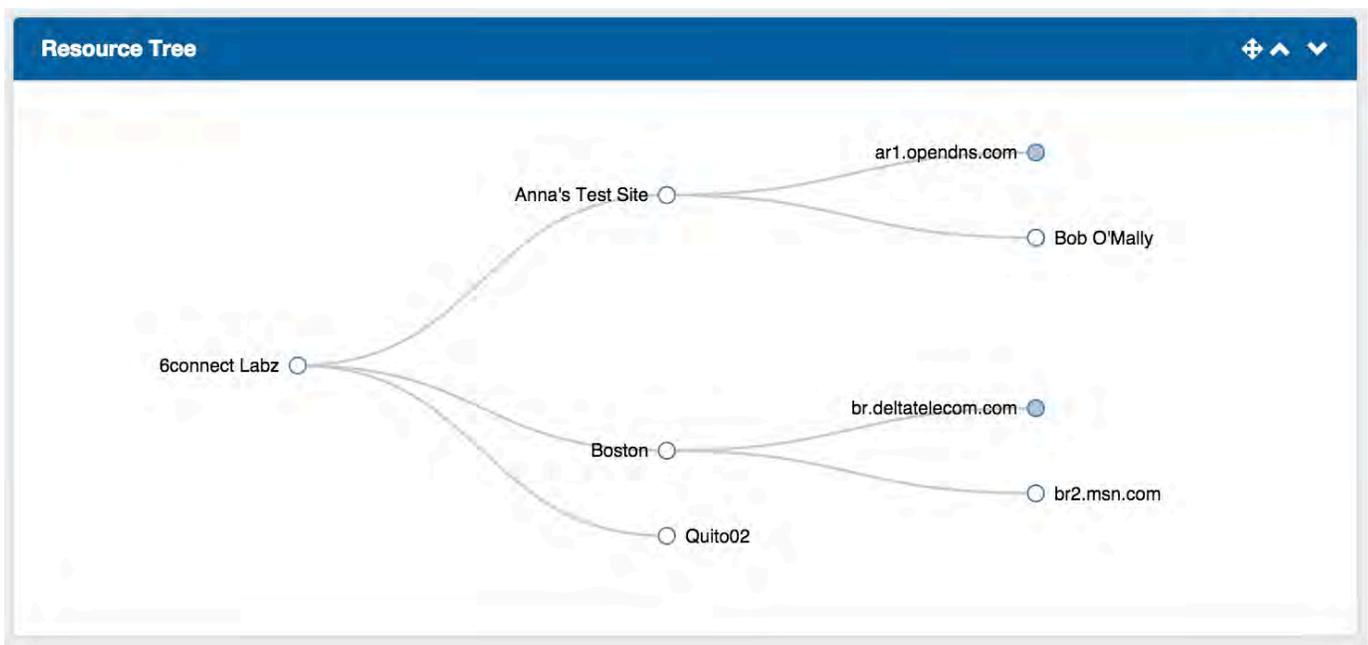

Single Click on a bubble will show the activity detail, and resource / IP block links if applicable.

Activity Chart Edit Options:

Title: Edits the title of the Widget shown on the header.

Resource Tree

Interactive graphical display of the resource structure for a parent resource.

Resource Tree Actions:

Users may:

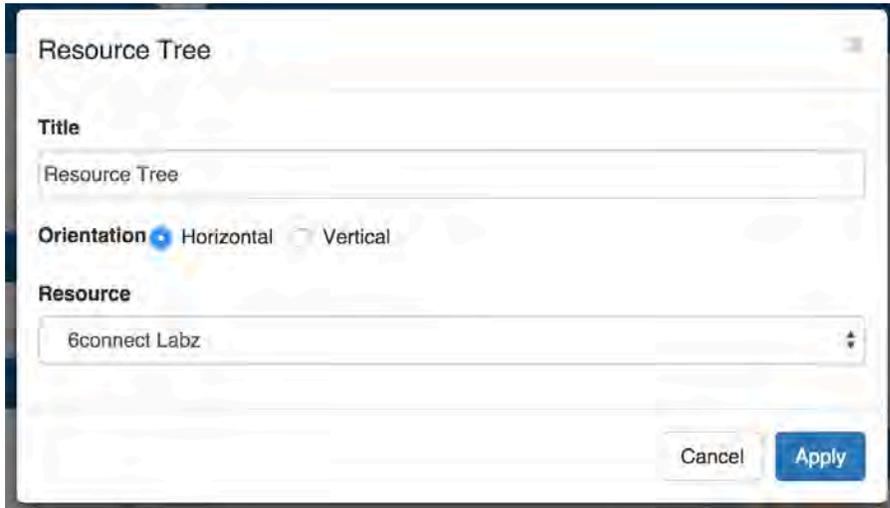

Click & Drag to move the chart within the Widget,

Use the Scroll Wheel to zoom in or out

Click on Filled dots to expand the tree to show the children of that resource.

Double click on a resource in the tree to give you the option to navigate to the resource's entry page.

Resource Tree Edit Options:

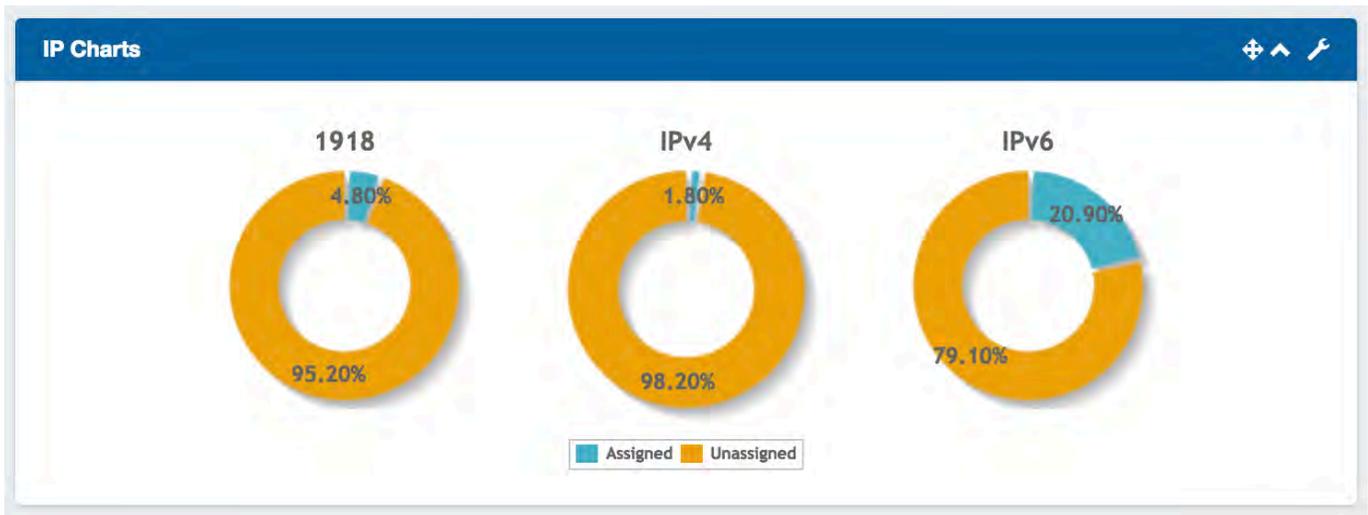

Title: Edits the title of the Widget shown on the header.

Orientation: Select "Horizontal" to view the tree in horizontal form, with the top level resource on the leftmost side of the widget, and children expanding to the right. "Vertical" will show the tree with the top level parent at the top of the widget, with children expanding downward.

Resource: A text search box to select the resource that will be the top level resource for the tree.

When done editing, hit "Apply" to save your changes, or "Cancel" to exit without saving.

IP Charts

Illustrates the percentage of assigned vs unassigned hosts for 1918 / IPv4 / IPv6 space out of the total available hosts in ProVision viewable by the user.

IP Charts Edit Options:

Title: Edits the title of the Widget shown on the header.

Working with Resources

Resources

- Resources
 - What is a Resource?
 - How to Work with Resources?
 - Additional Information

What is a Resource?

The "Resource" system is tied to the Permissions structure. What this means is that you get granular control on a resource level and can create groups around a single resource or even groups of resources. Since Resources can inherit permissions from others - it can be an easy way to categorize generic objects.

WARNING!

There are key Resources that are used by the System that should not be deleted. We have put in some safeguards in the UI, but the API can delete these resources if prompted. The resources that you should not remove are "Holding" and "Reverse". The "Available" Resource can be renamed - simply not deleted.

How to Work with Resources?

The Resource is an entity that users can assign Network Resources to (IP blocks, hosts, DNS zones, etc.). You can also create hierarchies between resources which allows you to leverage permissions to control who can view and interact with any given resource and its assigned elements. Please note that you can also have Resources that do NOT have anything assigned to them regarding Network Resources. The result of this flexible architecture is that you can work with Resources in three ways:

- **Resource Entries:** These are the actual Resource names. When you click the "Add Entry" button you can customize various elements of the entry and assign the Parent Resource, Section and Category from their respective dropdown menus. You may also add a Custom ID if desired. When done, hitting "Create" will pull up the field set for the chosen Section and allow you to enter the data for the given Entry.

The screenshot shows a web form for adding a resource entry. The breadcrumb trail is "Resources / Entries / Add Entry". The form is titled "Fundamentals" and includes the following fields:

- Name (required):** A text input field containing "Some Resource".
- Section:** A dropdown menu with "Resource Holder" selected.
- Parent:** A dropdown menu with "TLR" selected.
- Category:** A dropdown menu with "Uncategorized" selected.
- Custom ID:** An empty text input field.

At the bottom right of the form, there are two buttons: "Cancel" and "Create".

- **Resource Sections:** These can be anything from "customers" to "firewalls" to "cross-connects". Since you can customize the fields for these elements, and assign them to a Parent Section, you have flexibility in organizing the data. Check out [Customizing Sections](#) and [Customizing Fields](#) for more details on how to fit these elements to your business.

Name	Entries	Category
Circuit - LAN	2	Uncategorized
Circuit - WAN	7	Uncategorized
Coffee	0	Uncategorized
Contact	10	Uncategorized
Customer	4	Uncategorized
Data Center	3	Uncategorized
Desktop Server	17	Uncategorized
Device	60	Uncategorized
DHCP Servers	1	Uncategorized
Firewall	6	Uncategorized
Host	0	Uncategorized
Load Balancer	1	Uncategorized
Location	45	Uncategorized

- **Resource Categories:** Categories can be used to create some filtered views for given Resources and Sections. For example, you can create a Section called "Resource Holder" and then assign a Category "Customer". Then you can view a list of Resources that have been assigned to Category "Customer". In the same way, you could also assign a Section called "Router" under the Parent Resource "Corporate Datacenter" and then assign a Category "Infrastructure".

Name	Entries
A Random Category	0
CDW	4
Corporate IT	0
Customer	129
Infrastructure	0
Storage	0

Want to customize Sections? Check out [Customizing Sections](#) and [Customizing Fields](#) for more details!

Some examples:

- 1) Service Provider
- 2) Managed Service Provider
- 3) Datacenter/Colocation Provider
- 4) Enterprise

Working with Entries

Working with Entries

The list of Resource Entries is under the **Resource** Tab. To access it, you may either click on the Resource Tab, or select "Entries" from the Resource Tab dropdown menu.

- Working with Entries
 - Resource Tab / Entry List User Interface
 - Entry List Action Menu
 - Chart View
 - Create an Entry
 - Edit or Delete an Entry
 - Add Child Entries
 - Resource Clone
 - To Clone an Entry

Resource Tab / Entry List User Interface

Category	Section	Name	Total Allocations	Zone Count
		Verizon	0	0
		V1-Josh	0	0
		Virtual DC 1	0	0
		Vista Print	0	0
		vm1.foo.com	0	0
		Vodacom Customer	0	0
		vpn1.alliancedata.com	0	0
		VRF-ABC	0	0
		VRF-Blue1	0	0

1) Alphabetical Filter: Entries are organized by the first letter of the name. Click on a letter to see entries starting with that letter.

2) Add Entry Button: Click to add a new entry.

3) Pagination: Click to view additional pages of Entries under the selected letter.

4) Viewing Options: Select "Table View" or "Chart View" .

Table View (shown above), lists the Entries, Allocations, and Zone Count along with color-coded Category and Section information.

Chart View graphically shows the entries in filterable, hierarchy form.

5) Search Box: This text box allows the user to enter in criteria to filter the list of Entries.

6) Category: Color-coded Category indicator. The Category name will appear upon mouseover. Clicking on the Category box when the hand icon appears will redirect to a filtered list of entries of that Category.

7) Section: Color-coded Section indicator. The Section name will appear upon mouseover. Clicking on the Section box when the hand icon appears will redirect to a filtered list of entries of that Section.

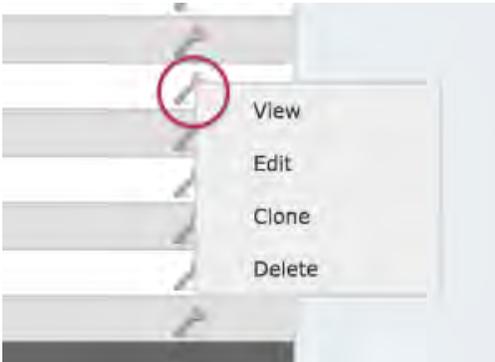

8) Name: A list of the Resource Entry names. Clicking on a name will take the user to that resource's individual entry page.

9) Allocations: The number of IP blocks assigned to that resource.

10) Zone Count: The number of zones assigned to that resource.

11) Action Menu: The Action Menu (wrench icon) gives a list of additional actions to perform on the zone

Entry List Action Menu

Clicking on the Action Menu in the Entry List View will bring up the following options:

View: Opens the resource's Entry page

Edit: Opens to the resource's Edit page

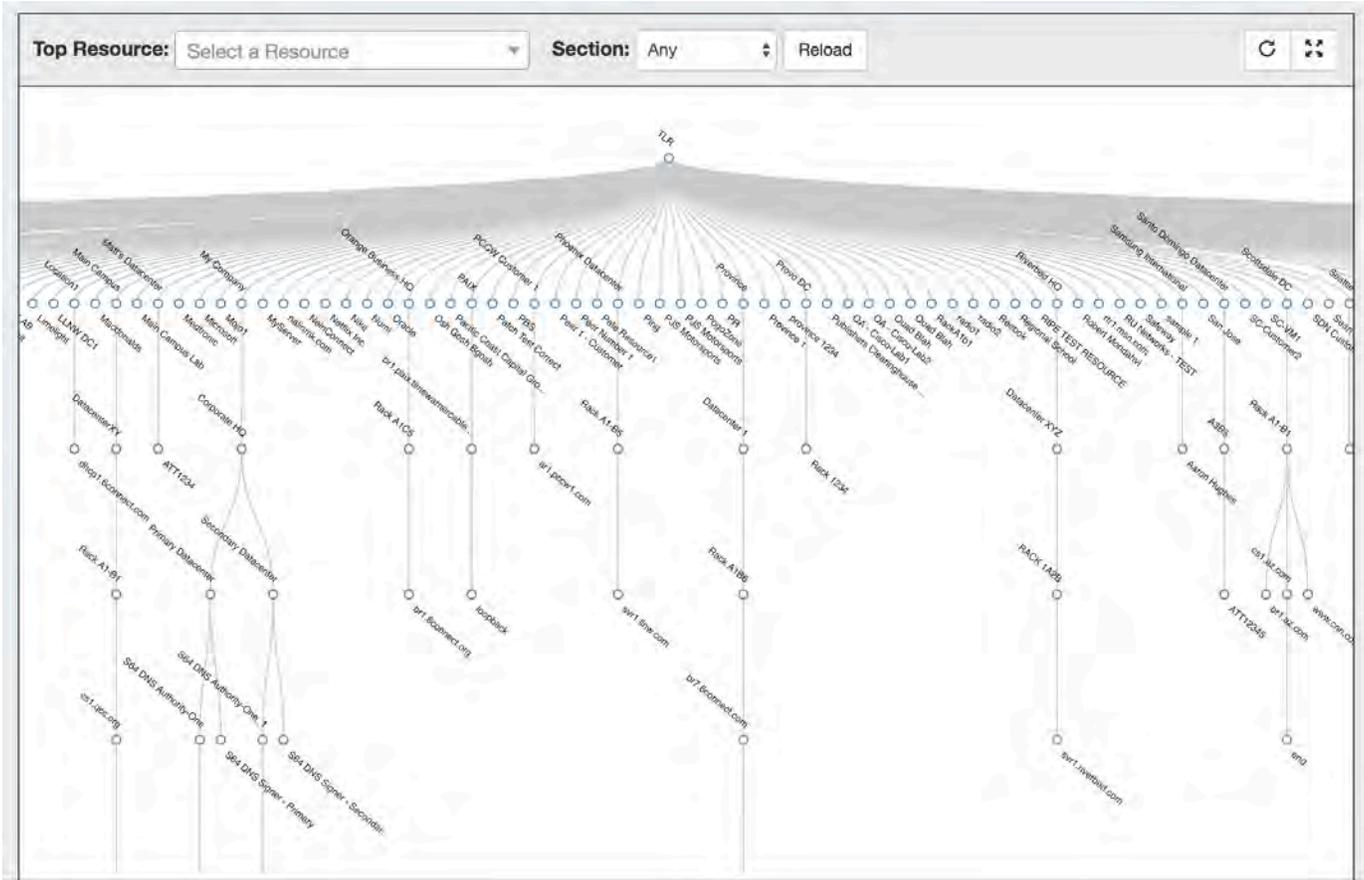

Clone: Opens the clone resource page for the selected resource

Delete: Deletes the resource, if appropriate permissions exist.

Chart View

Chart View illustrates the resources created in a node-based tree.

Select the Top Resource and/or the Section Type from the dropdown menus to limit the view, if desired, and then click "Reload". Users will only be able to view sections of the resource tree on which they have view permissions.

While viewing the main chart, you may:

- View in horizontal or vertical tree mode by clicking the "Switch Chart Orientation" button.
- View fullscreen by clicking the "View Fullscreen" button.
- Left click and drag within the tree view, or scroll wheel in/out to change the area viewed.
- Single or double-clicking on a node with children will collapse or expand the tree at that resource.
- Clicking and dragging a resource node to another resource will relocate the resource to be a child of the resource it is dropped on.

Hovering over a specific Resource or node, then right clicking will open a context menu with the following options:

- Quick View:** Shows summarized details about the resource and its children, and links to the Resource Entry page(s).
- Edit:** Opens to the resource's Edit page
- Clone:** Opens the clone resource page for the selected resource
- Delete:** Deletes the resource, if appropriate permissions exist.

Create an Entry

1) To create a new Entry, click on the "Add Entry" button from the Resource Tab / Entry List Page.

This will take you to the Add Entry page.

2) Fill in the Name of your new Resource Entry, select a **Section** (the chosen Section determines what gadgets will show on your new resource's

Entry page), the Parent Resource, Category, and enter a Custom ID number if desired. When complete, click the "Create" button. If you wish to exit without saving your changes, click "Cancel".

Edit or Delete an Entry

To edit or delete an Entry, go to the bottom of that resource's Entry Page, and select "Edit".

This will bring up the Edit Entry Page, where you can edit basic information such as Name, Section, Parent, Category, or Custom ID. If Fields are associated with the Section type, those may be edited as well.

When done, hit the "Save" button. If information was added to Fields, that information will now show up on the Entry Page.

A screenshot of the 'Edit Entry' page. The breadcrumb trail at the top reads 'Resources / Entries / MyNewEntry / Edit'. The page is divided into two main sections: 'Basic Information' and 'Fields'.
Basic Information:
- Name (required): MyNewEntry
- Section: Customer (dropdown)
- Parent: TLR (dropdown)
- Category: Customer (dropdown)
- Custom ID: 1023
Fields:
- Abuse POC: Bob Smith
- GIS Data: No (dropdown)
A message below the fields states: 'Some fields are hidden. Find out why.'
At the bottom, there are three buttons: 'Delete' (red), 'View' (orange), and 'Save' (blue). The 'Save' button is circled in red.

If you wish to delete the Entry, select the "Delete" button.

Note

If an entry has children, the delete option will not be available. Child Entries must be deleted before a Parent Entry can be deleted.

NewChildEntry	Data Center	Uncategorized

Resource Clone

Cloning an Entry duplicates the Entry and, if desired, any Child Entries existing under it.

This feature can be used to quickly and efficiently create multiple resources with same format, field information, or similar hierarchy structure. One example may be a datacenter with x number racks with y number of servers on each. One rack, with its servers as child entries could be created, and then cloned until the necessary quantity is reached. As text field information is copied during the clone, changes in individual server information would still need reviewed and updated. Think of cloning as creating a template from an existing Resource Entry.

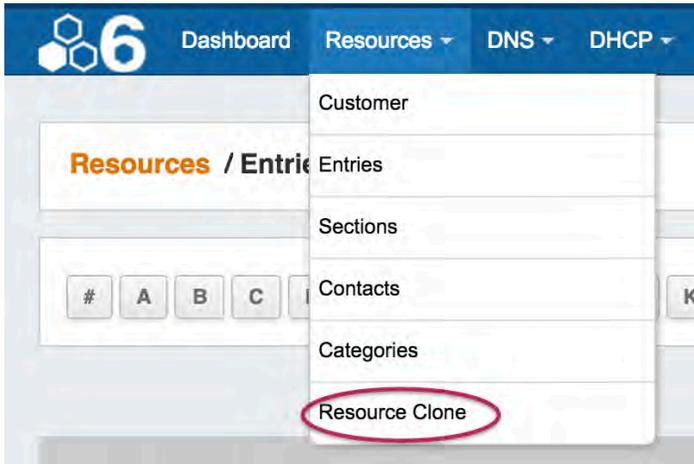

Information Cloned: Format of the original Resource (which gadgets are enabled, location, fields), contact / tech information, field information, and (if selected) Child Entries, and Child Entry sections, fields, and field information - in general, items that are chosen or input at the entry creation, or input into text fields.

Information not Cloned: IP Blocks, DNS Zones, uploaded documents - in general, items that are *assigned* to the entry rather than input into fields.

To Clone an Entry

The Resource Clone feature may be accessed from either the [Resources](#) Tab dropdown menu, or from a Resource Entry page.

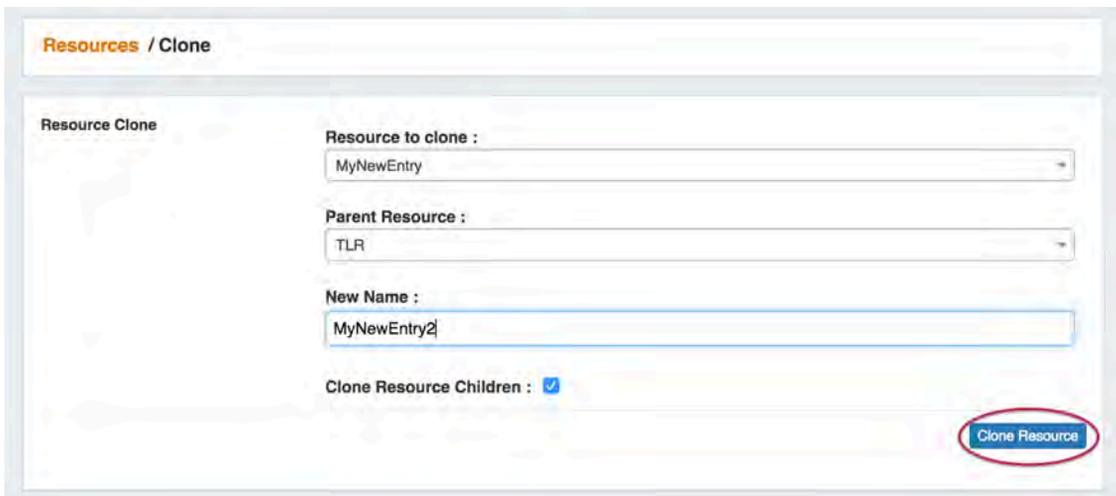

From the [Resources](#) Tab dropdown, select "Resource Clone". This will take you to the Resource Clone page.

You may also select "Clone" from the bottom of a Resource Entry page, in which case the Entry page you clicked "Clone" from will be automatically selected as the resource to clone.

Once on the Resource Clone Page, enter the Resource to clone, Parent Resource, and the New Name for the clone. If you wish for all children of that resource (and their children, if applicable) to be cloned, check the "Clone Resource Children" checkbox. When complete, click the "Clone Resource" button.

To repeatedly clone the resource, simply change the "New Name" field (if you want the subsequent clones to have a different name), and click "Clone Resource" again. You may repeatedly click "Clone Resource" and each click will produce a new clone.

When done, you may click on the link provided for the most recently created clone, or hit the XXXX button to return to the parent resource.

Tip

Review the cloned resources using the chart view to see the hierarchy structure!

Customizing Sections

Customizing Sections

You can create as many Sections as you wish (Firewall, Server, VM, Virtual Interface, etc.) and customize the fields that you care about for each Section. For example, you may not need to track the console port for your virtual firewall, so you would simply not use that field for the "Virtual Firewall" Section. This way you can still track the console port for your physical firewalls like normal.

- Customizing Sections
 - Step 1: Create a New Section
 - Step 2: Add a Custom Field to a Section
 - Step 3: Edit Custom Field Data
 - Step 4: Add Gadgets to your Section

Step 1: Create a New Section

Click "Add Section" from the **Sections** sub-tab under the **Resources** Tab

The screenshot shows the 'Resources / Sections' page. At the top, there is a navigation bar with 'Dashboard', 'Resources', 'DNS', 'DHCP', 'IPAM', 'Peering', 'Log', and 'Reporting'. A search bar is on the right. Below the navigation, the page title is 'Resources / Sections'. On the right side, there is a blue button labeled 'Add Section' which is circled in red. Below the button is a search bar labeled 'Search Resources...'. A table lists existing sections:

Name	Entries	Category
Circuit - LAN	2	Uncategorized
Circuit - WAN	7	Uncategorized
Coffee	0	Uncategorized
Contact	10	Uncategorized

Create a new Section by specifying a Name, Parent, and Category. Then hit the "Create" button.

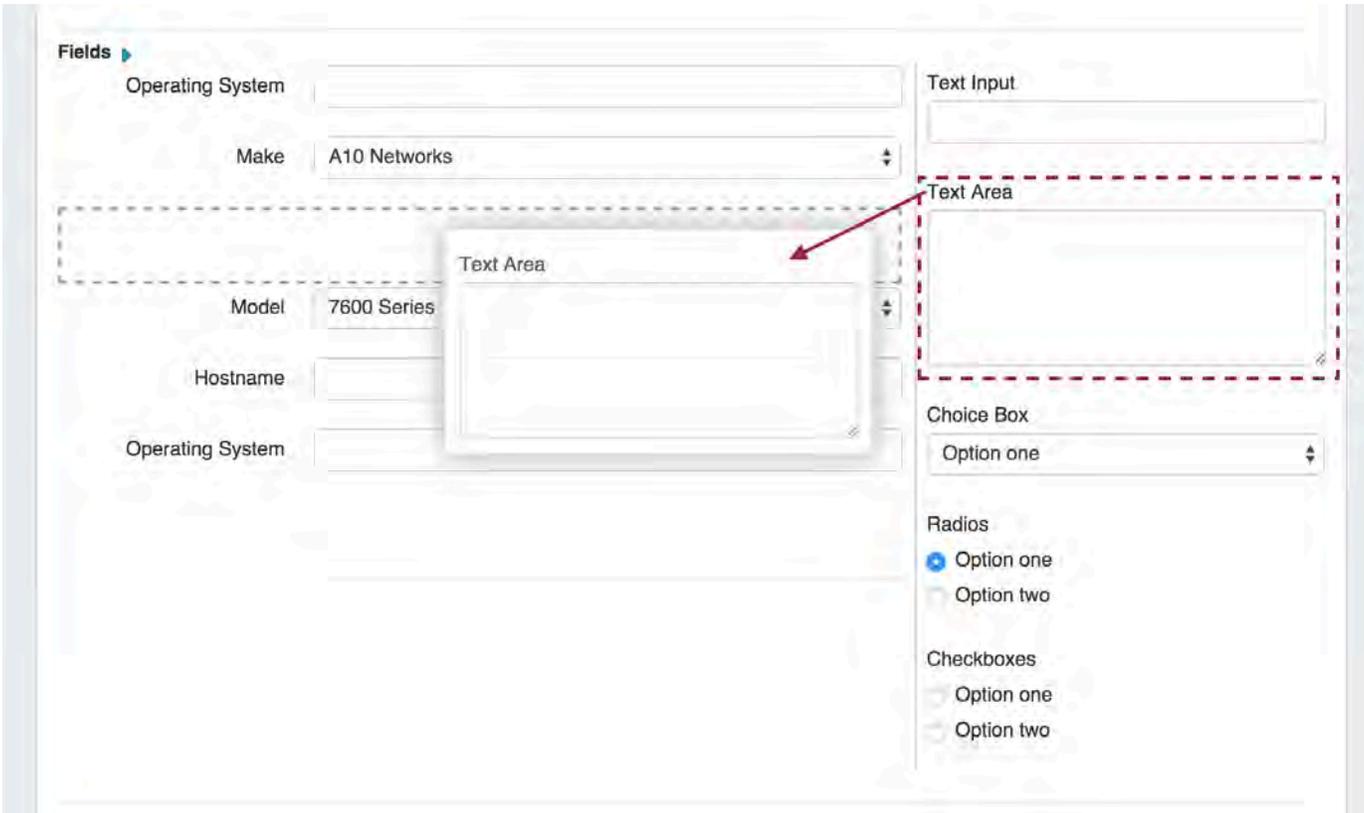

The screenshot shows the 'Resources / Sections / Create Section' form. Under the 'Fundamentals' section, there are three input fields: 'Name (required)' with the value 'My Custom Section', 'Parent' with the value 'TLR', and 'Category' with the value 'A Random Category'. A 'Create' button is located at the bottom right of the form.

Step 2: Add a Custom Field to a Section

Manage existing fields and add custom fields for the selected Section by clicking "Edit Section"

Add existing or [Custom Fields](#) for your Section. You can add new [Custom Fields](#) of different types (text input, text area, choice box, radios, checkbox) by dragging and dropping the fields as well as using any existing fields that are available. See the [Customizing Fields](#) page for more details.

Step 3: Edit Custom Field Data

Select the field name and you will get an editing window to modify the parameters of the field. Custom fields may be renamed and have other attributes updated, whereas protected system fields may have noted restrictions.

Step 4: Add Gadgets to your Section

You will notice on this customization screen that you also have an area for [Gadgets](#). Gadgets are modules of additional functionality that can be added to the UI of a given Resource. Simply select the Gadget you want to show for that section, hit "Add", then organize by dragging into the order you wish them to appear on the page. Once added to the Section, Gadgets will be visible for all Resources of that Section.

For a detailed list of gadgets and descriptions, see the [Gadgets](#) page.

Customizing Fields

Working with Fields

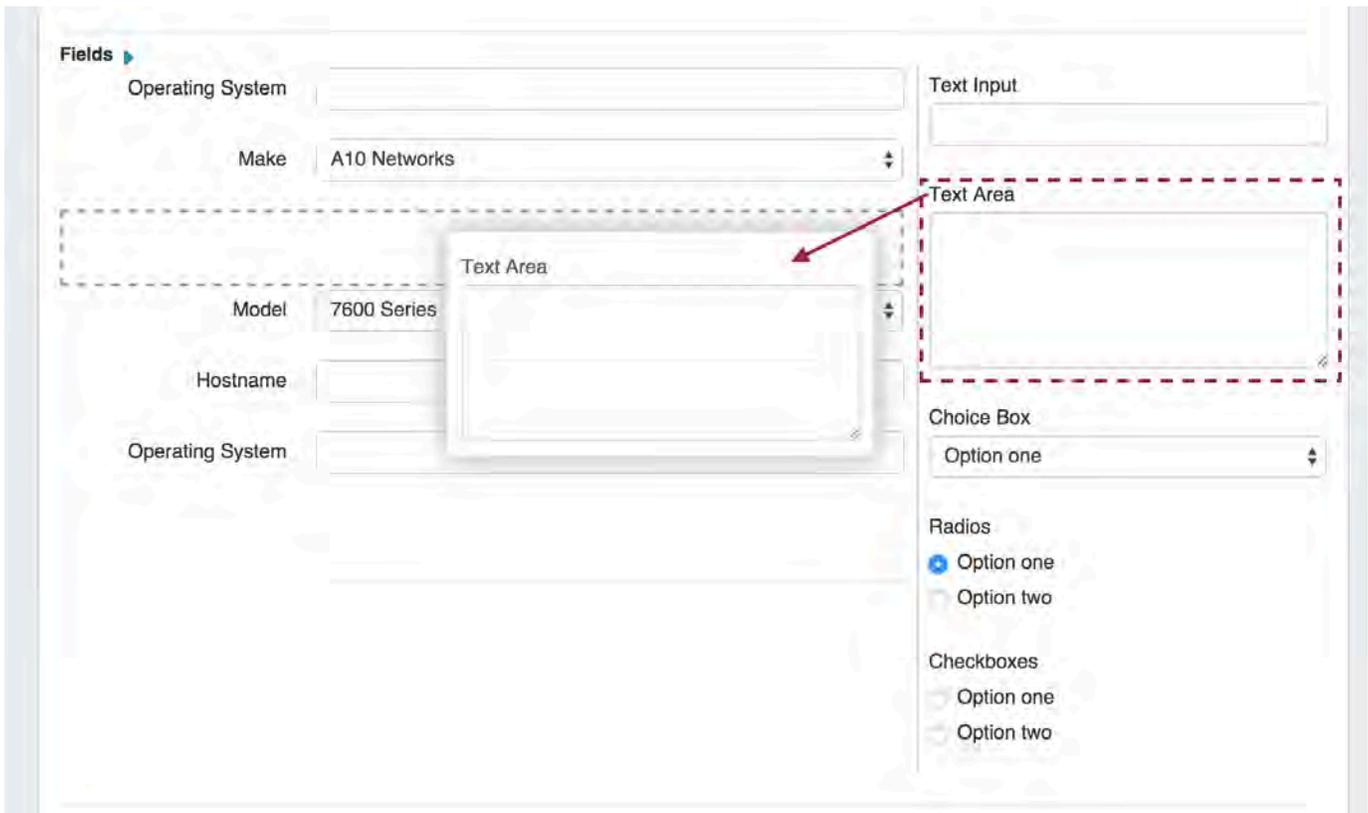

- Working with Fields
 - Creating Fields
 - Editing/Removing Fields

Creating Fields

To add an existing field to a Section, select the field name from the dropdown menu and click on the "Add Field" button.

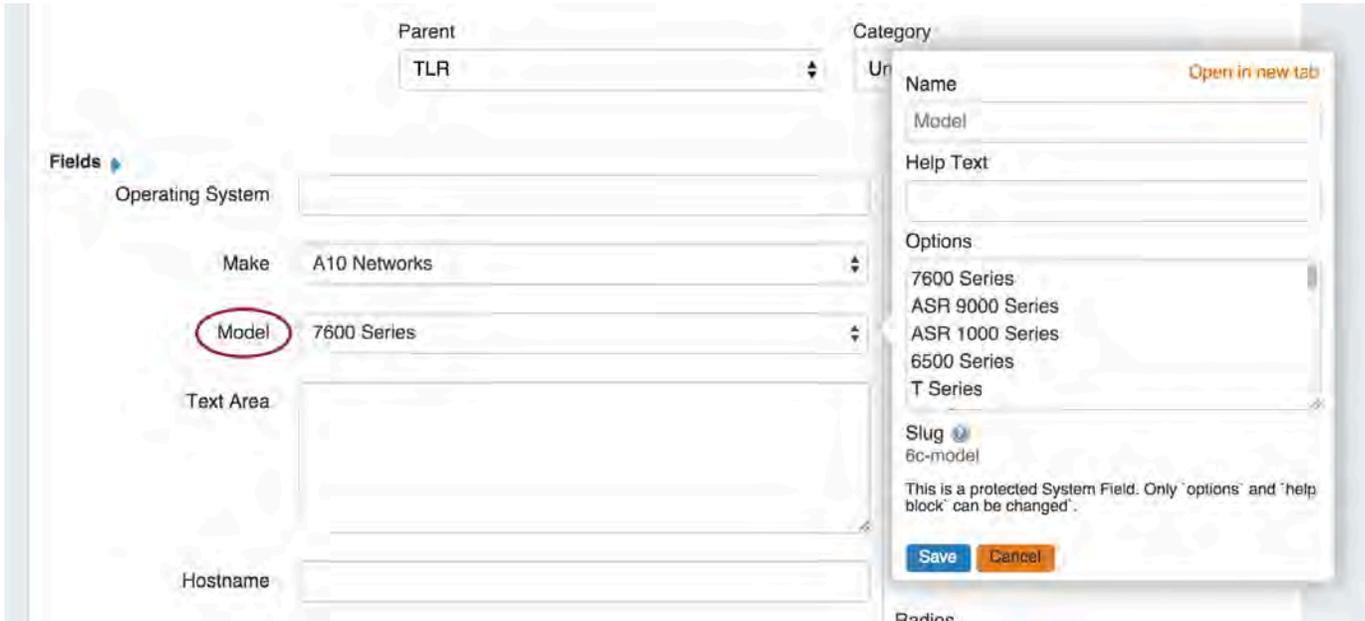

To add a new custom field to a Section, simply click on the custom field type name (Text Input, Text Area, Choice Box, etc), then drag the field over to the field list and release in the desired location. Edit the field name and options as described in Editing / Removing Fields.

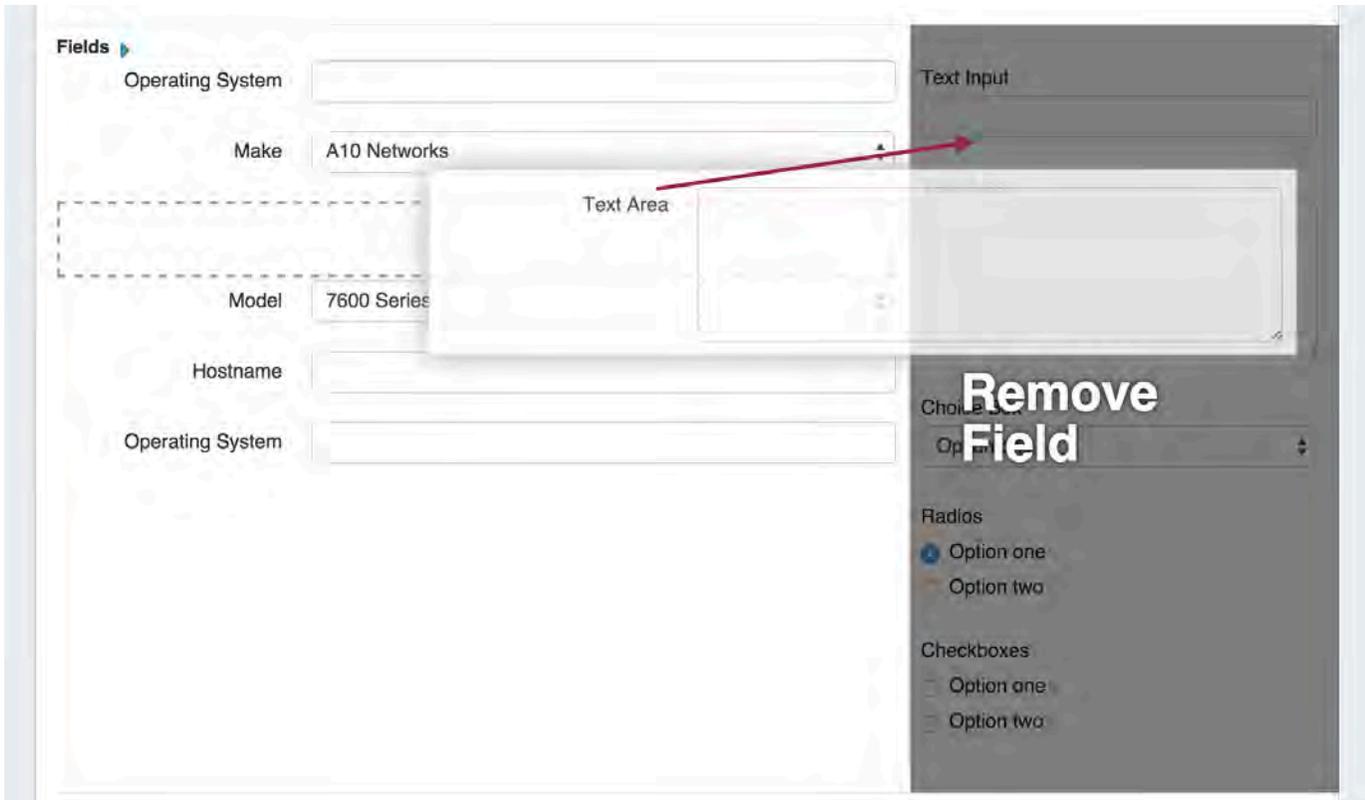

Editing/Removing Fields

Once fields are added to a Section, you can click on the field name to make additional changes to the fields. Custom fields may be renamed and have other attributes updated, whereas protected System Fields may have noted restrictions.

To rearrange the field list order, click and hold on the field name, then drag and drop into the preferred order.

To remove a field, click and hold on the field name, then simply drag and drop the field to the right side of the screen to where the "Remove Field" prompt is visible.

What are Gadgets?

Our gadget system is similar to the Atlassian Gadget system (and Google Gadgets). When creating or editing a Section, gadgets can be added in a way similar to how you would add or remove a field (see [Customizing Sections](#)). Gadgets are best described as self contained webapps; widgets but with more power. Gadgets can have their own fields, HTML templates, and even accompanying scripts and stylesheets. They can interface with the API to display simple information such as the Type of the Resource, or they can perform much more complex functions as demonstrated with the IPAM gadget in the following section.

Available Gadgets

Resource View

This visual element is used on the Resource Holder Section type. The Resource view displays and provides links for the Section and Category for the Resource.

Contact Info

This visual element is used on the Resource Holder Section type. In the Contact Info Gadget, you can track information such as mailing / billing addresses, phone number, and fax number for that Resource.

Contact Info

Delete Role

Delete

×

Unassign: Unassigns the contact from the resource

View: Redirects to the contact's detail page in the Contact Manager

Refer to the [Contact Manager](#) page in the documentation for more detail on working with the Contacts gadget and the Contact Manager.

A Note on Permissions

The ability to view and assign a contact to a resource is restricted by the Parent assigned to the contact upon creation. If a user does

not have permissions for a contact's Parent Resource, that contact will not be able to be viewed / assigned via the gadget.

Tech Info

This visual element is used on the Resource Holder Section type. This Gadget allows you to list DNS servers, ARIN information, and enable/disable customer privacy.

Document Storage

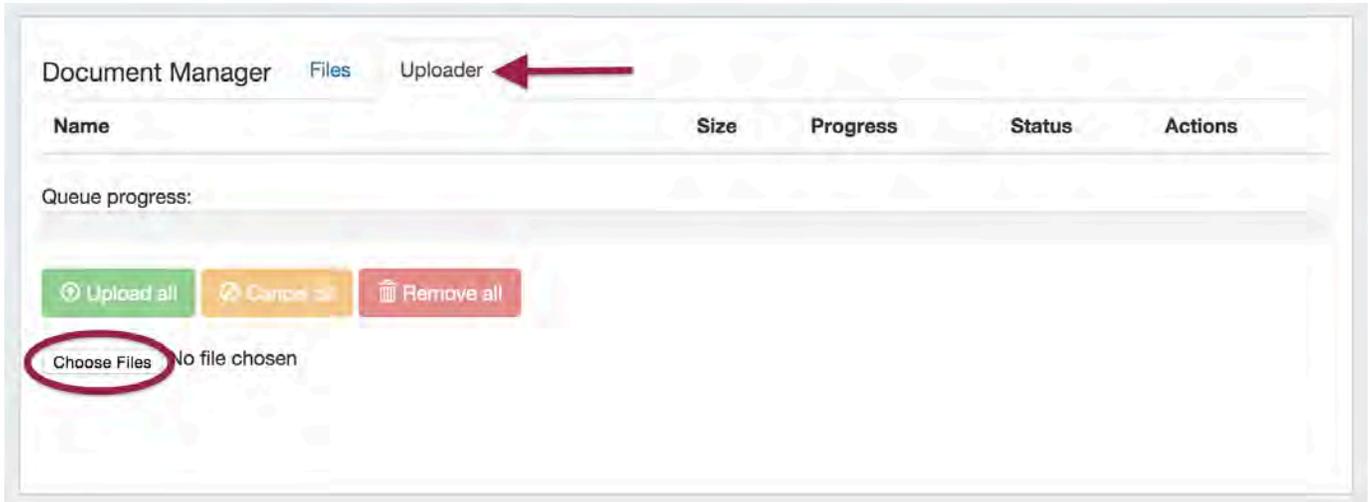

The Document Storage gadget allows you to upload documents to a resource, and have those documents accessible to download from the 6connect cloud to your local machine. It may be enabled on any Section type.

Note: The uploader has a file size limit of 14mb, files above this size will not successfully upload.

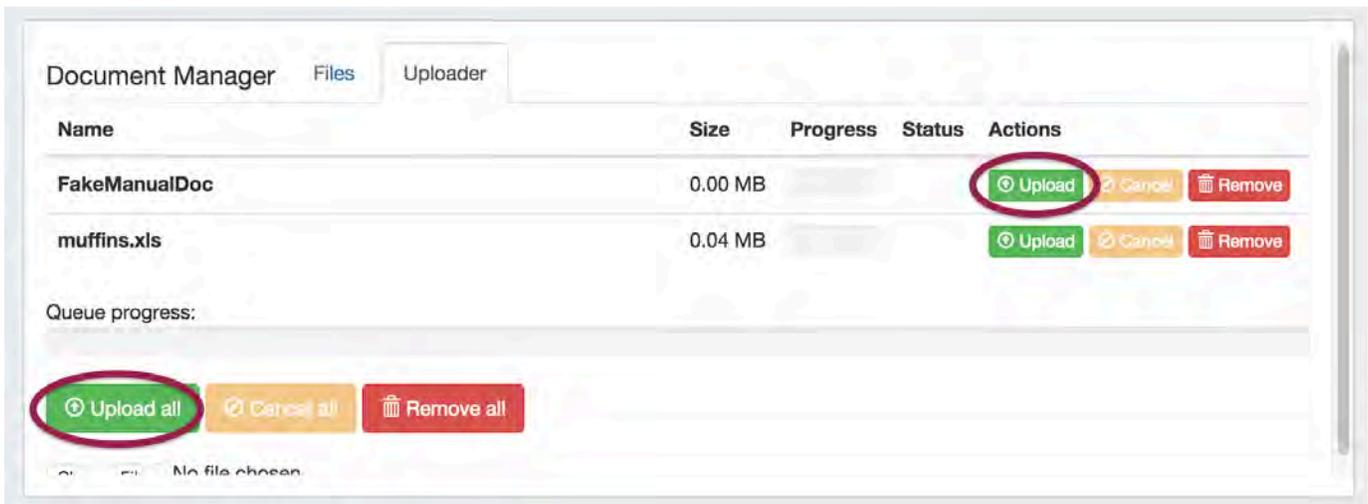

Upload Files

First, ensure the Document Storage gadget is enable for the Section type. Then, select the "Uploader" tab under the Document Manager gadget.

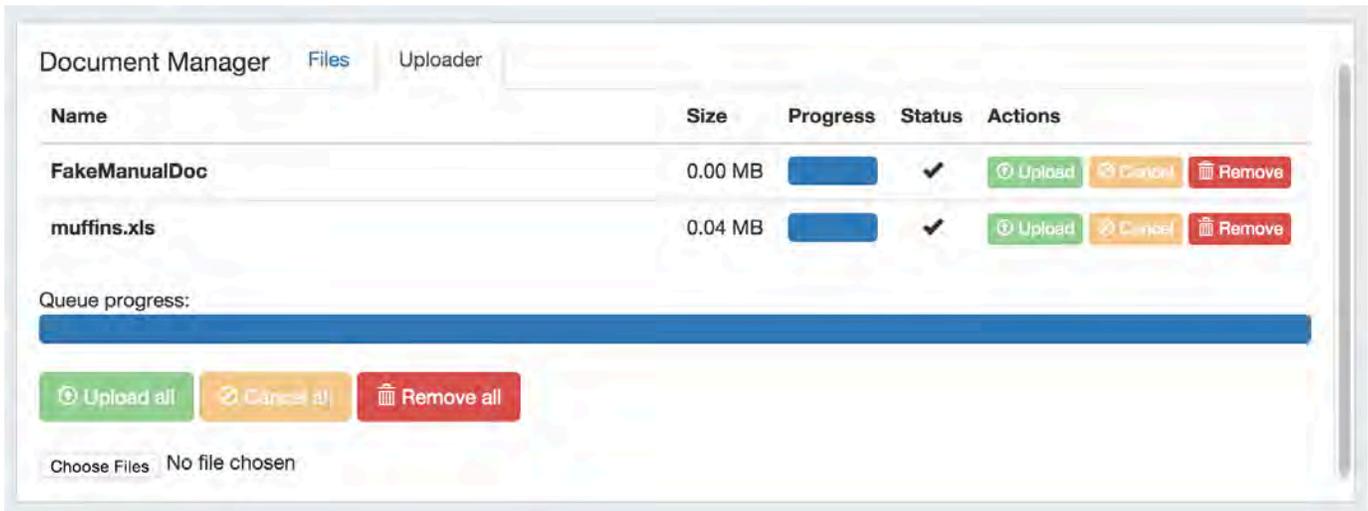

Click on the "Choose Files" button, and select the file(s) you would like to upload.

The selected files will show in a list under the Uploader tab. To upload the file(s), click on either the "Upload" button adjacent to the file to upload the individual file, or the "Upload All" button to upload all files listed. You may also choose to remove files from the upload list, or cancel.

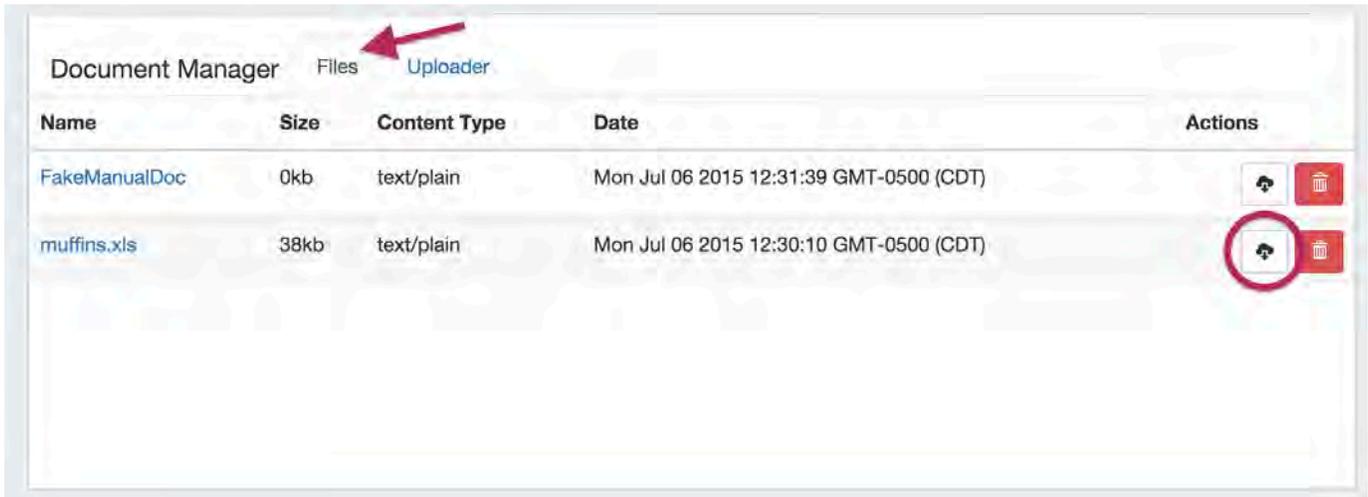

Once the progress bar is filled in, your upload is complete! Your files will show under the "Files" tab.

Download Available Files

Successfully uploaded files are listed under the "Files" tab of the Document Manager gadget. From here, you can see the file Name, Size, Type, Date, and available Actions.

To download a file to your local machine, ensure you are on the "Files" tab, then click on the "Download from Cloud" icon.

If a file is no longer needed, you may delete the file from the Document Manager by clicking on the Delete (trash can) icon.

DNS

This gadget is used on the Resource Holder Section type. The DNS Gadget shows zones that have the current Resource Holder set as their parent, and provides links to the zone's View Zone page. To go to the View Zone page, you may either click on the zone name, or click on the Action Menu (wrench icon) and select "View Zone". For more information on DNS functions and managing zones, refer to the documentation for the [DNS Tab](#).

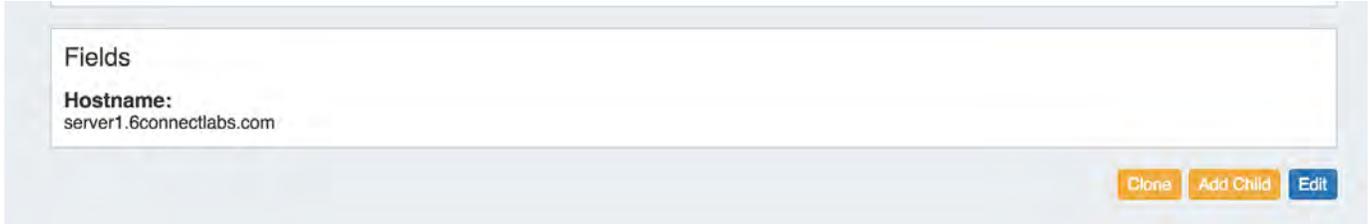

DNS Autogenerator

The DNS Autogenerator Gadget uses the Hostname field (6c-hostname-fqdn) of the Resource to generate a list of DNS forward and reverse zone entries based on the blocks assigned to the Resource in the IPAM Gadget. It will generate a list of potential zone records - just select the ones you want to create, save the changes and you are ready to push the zones.

Enabling the DNS Autogenerator

To set up this Gadget, ensure that the Section of the Resource (typically, "Resource Holder"), has the "Hostname" field (6c-hostname-fqdn) and the DNS Autogenerator Gadget added to the Section. (See: [Customizing Sections](#) and [Customizing Fields](#)).

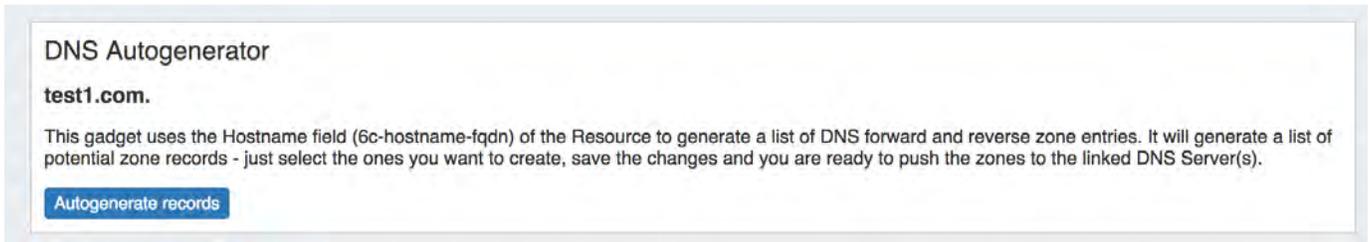

Then, check that the Resource itself has information entered into the "Hostname" field. If the field is already filled out, it will show in the "Fields" information area at the bottom of the Resource Entry page. To add or edit the hostname, click "Edit" at the bottom of the resource entry page, add the information to the Hostname field, and click "Save".

Once a hostname has been associated with a Resource, and the page refreshed, the DNS Autogenerator Gadget will be visible.

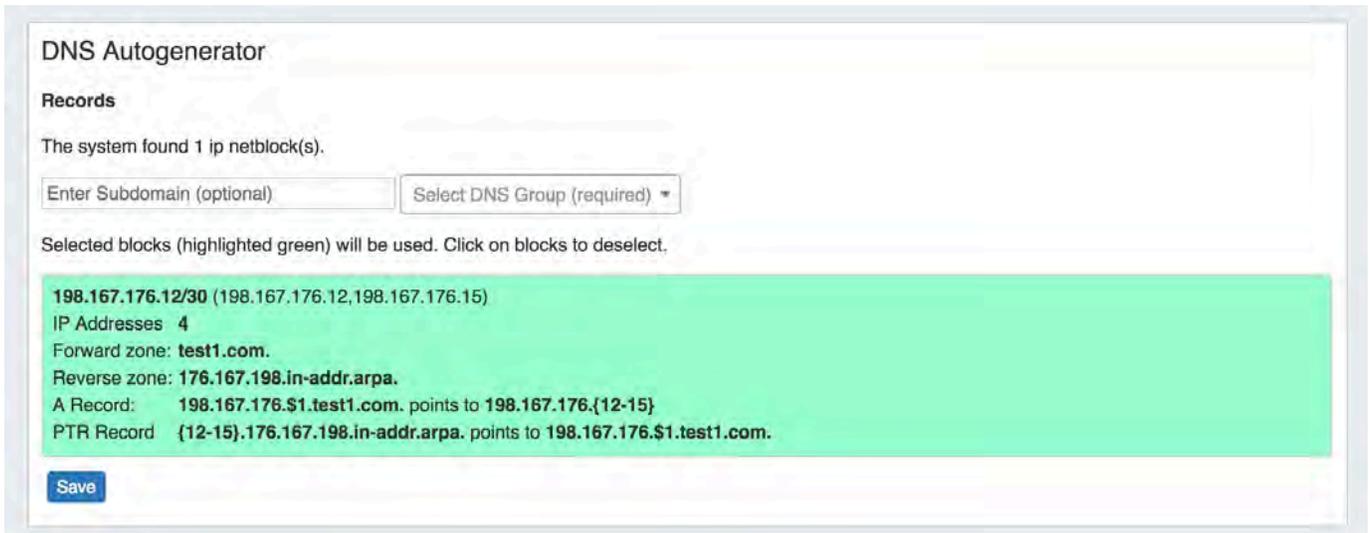

Working with the DNS Autogenerator

One enabled and visible, the DNS Autogenerator Gadget will initially show a short description, the hostname, and a button to "Autogenerate Records".

Before starting, check that the blocks assigned to the Resource in the IPAM Gadget are correct and up-to-date - the Autogenerator uses these blocks to create the records. If using a DNS Group other than "Default" to hold zones, ensure that the desired DNS Group to hold the generated records has been set up. (See: [Working with DNS Groups](#)).

When ready, click the "Autogenerate Records" button. The Gadget will search through the blocks in the IPAM gadget and provide a list of found blocks.

Next, add in a subdomain if desired (optional), and select the DNS Group to hold the records (required). Click on the listed blocks to select (highlighted green) or deselect (grey) for DNS zone / record creation.

Finally, hit the "Save" button at the bottom of the gadget - the selected forward and reverse DNS records will be created and added into the DNS Group, viewable in the [DNS Tab](#).

At this point, you may choose to immediately push the autogenerated zone(s), schedule a push, or re-run the workflow to edit the subdomain or group.

DHCP Management

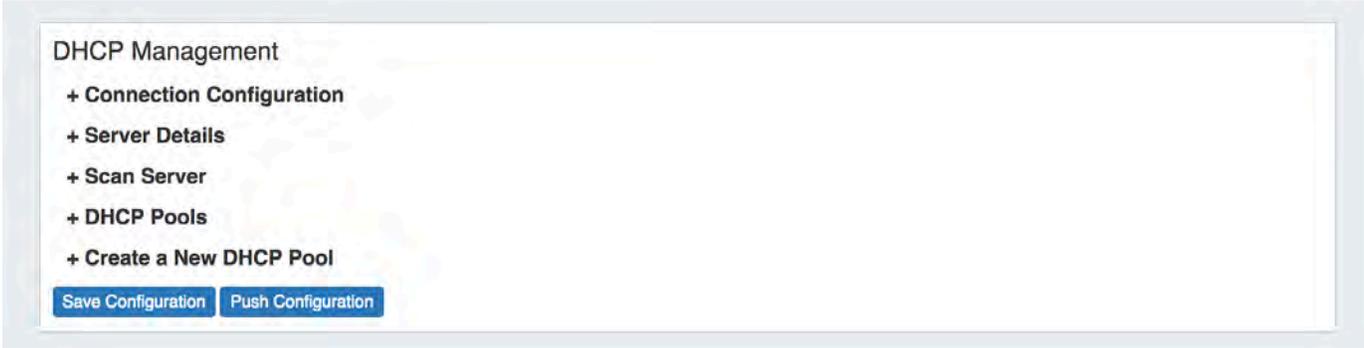

This visual element is used on the Server Section type.

The DHCP Management Gadget in the "Off" configuration:

To enable the DHCP Management Gadget, select the "On" radio button next to "DHCP Services", and click the "Update" Button.

The DHCP Management Gadget in the "On" configuration:

Each of the four sections in the DHCP Management Gadget - Connection Configuration, Server Details, DHCP Pools, and Create a New DHCP Pool - may be expanded to change settings in each area.

Additional sections may appear in the Gadget once unpushed or pushed configurations are saved.

For detailed information on working with the DHCP Management Gadget, see [DHCP Tab - Managing DHCP Server Configurations](#).

DHCP Customer Configuration

The DHCP Customer Configuration Gadget allows users to assign IP aggregates to the DHCP server pools and generates DHCP Server Configuration changes depending on the tag(s) and DHCP options selected.

These configurations are then sent to the associated DHCP server Management Gadget as "Unpushed Configurations", where they may be held until a manual or schedule push occurs.

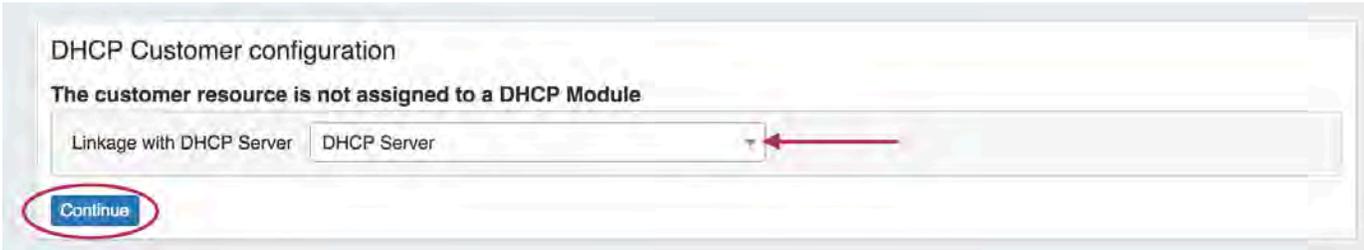

Before You Begin

Before using the DHCP Customer Configuration Gadget, the following should be set up in ProVision:

- The associated DHCP server should be created in ProVision and set up in the DHCP Management Gadget (See: [DHCP Tab](#)).
- Add the DHCP Customer Configuration Gadget to the desired Section. You may want to create a specific "DHCP Customer" Section for DHCP customer entries (See: [Customizing Sections](#)).
- Have, or set up APNIC DHCP Aggregates from the [IPAM](#) Tab with the desired IP space type, Region(s), Tags, and any desired VLAN criteria. Regions are a required field when assigning IPs from the DHCP Customer Configuration Gadget.
- If you are planning on Direct Assigning the DHCP blocks in the Customer Configuration Gadget, ensure that the desired blocks in the DHCP are split to individual /32 or /128 size. Smart Assign and Smart Browse will automatically split the block to assign the correct size.

Associate with DHCP Server

Once the Gadget is enabled, the first step is to associate it with an already-created DHCP server in ProVision. Select the DHCP Server to link to, and click "Continue".

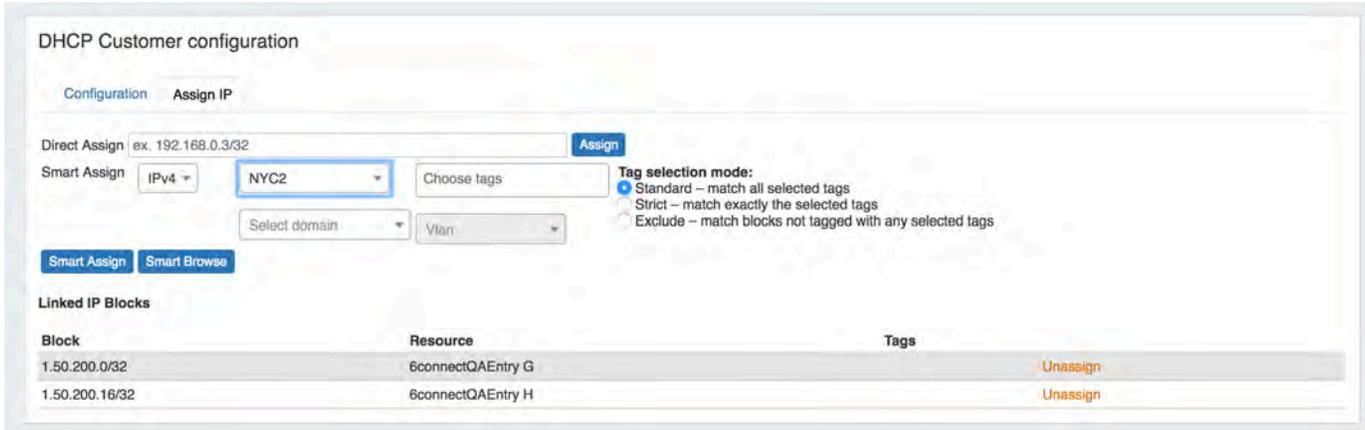

Assign IP's

Next, Assign IP's for Pools from DHCP Aggregates. You may Direct Assign, Smart Assign, or assign from Smart Browse based on the selected criteria.

Blocks must be out of "DHCP Available", and have an assigned Region.

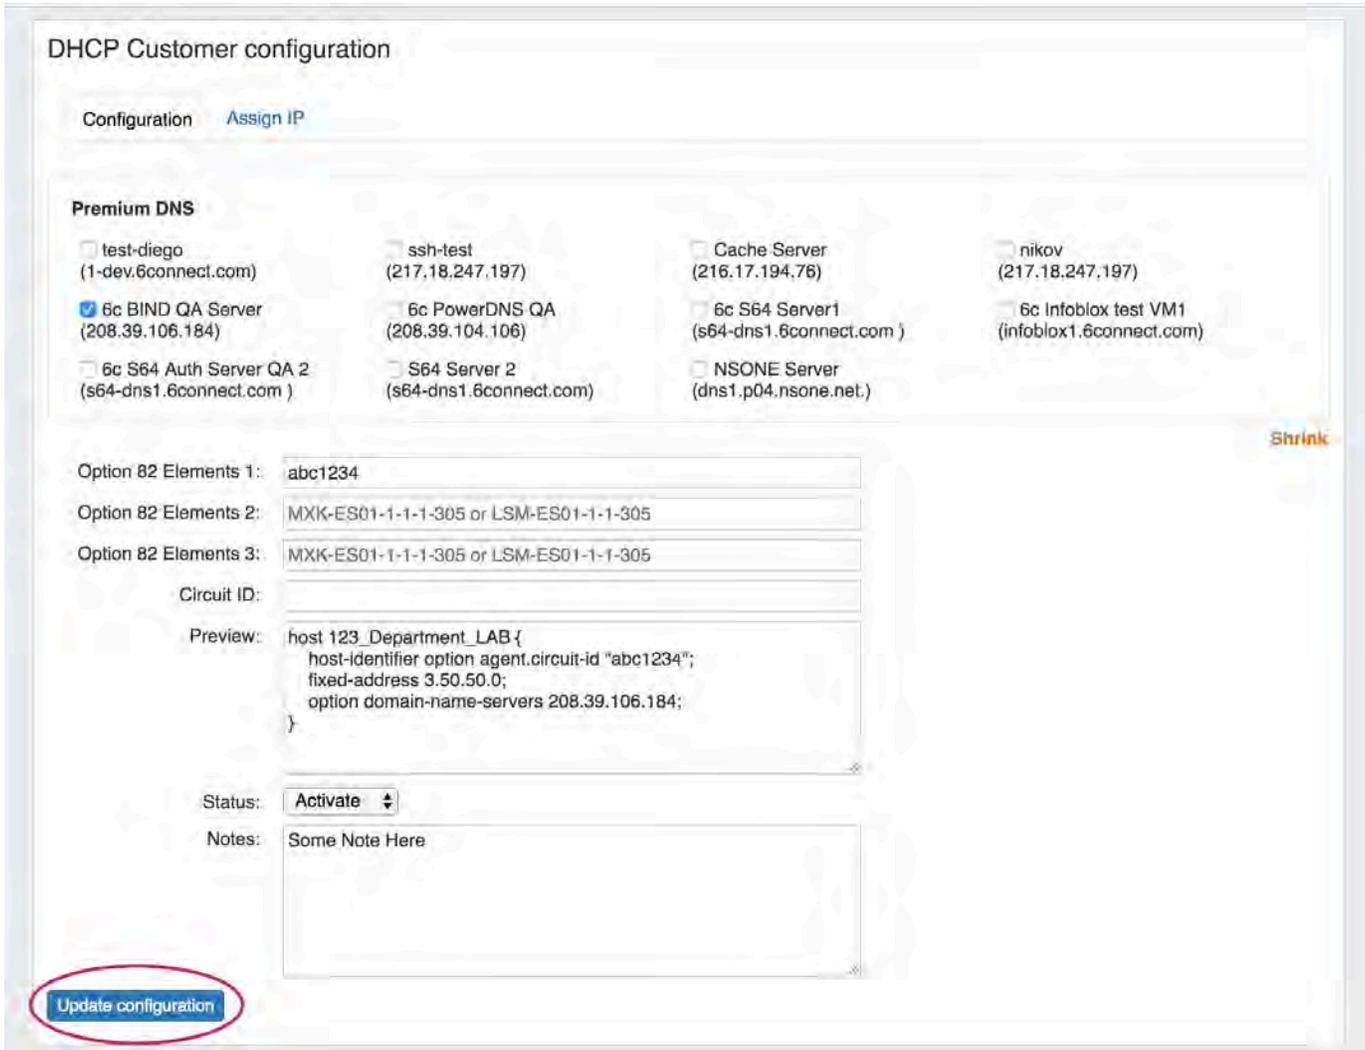

Once assigned, a Pool Name will be automatically generated under "Resource". Pools may be unassigned by clicking the "Unassign" button.

Set up Configuration

Once IP's have been assigned, the "Configuration" tab will appear. Click on the tab, and then select or deselect the DNS Server associated with the Customer, add Option 82 Elements, Add Circuit ID text, and add notes if desired. Use the "Preview" field to confirm the accuracy of the data, and select the status as "Activate" or "Terminate".

When done, click "Update Configuration". The configuration will be sent to the associated DHCP server's DHCP Management Gadget.

Reviewing and Pushing Configuration Updates

When a configuration has been saved from the DHCP Customer Configuration Gadget, it will appear as an "Unpushed Configuration" in the DHCP Management Gadget for the DHCP Server. If you expand that option, you will see the config elements highlighted – red are config

elements that will be deleted, green are config elements that will be added.

DHCP Management

- + Connection Configuration
- + Server Details
- + Scan Server
- + DHCP Pools
- + Create a New DHCP Pool
- + Unpushed configuration

```

subnet 3.50.50.8 netmask 255.255.255.248 {
range ;
host-identifier option agent.circuit-id "ghij1234";
option domain-name-servers 208.39.106.184;
}

host 123_Department_LAB_B {
fixed-address 3.50.50.1;
host-identifier option agent.circuit-id "cdef1234";
option domain-name-servers 208.39.106.184;
}

host 123_Department_LAB_A {
fixed-address 3.50.50.0;
host-identifier option agent.circuit-id "abc1234";

Added by ops@6connect.com on 2017-05-25T20:06:26+0000

Save Configuration Push Configuration

At this point, an Admin user may manually push the updated configuration, or use a [scheduled DHCP push task](#) to automate the pushes.

Peering Session

This visual element is used on the Router Section type. In Peering Sessions Gadget, by clicking on the Action Menu (wrench icon) you can perform basic session edit functions such as Edit, Config Manager, Email, Admin Up/ Down, and Delete. For additional information on Peering, see [Peering v2](#).

Peering Sessions
Updated: 2014-11-07 14:34:11

Exchange	Group	Source	Peer	Destination	Type	Prefixes	State	Notes
Equinix Palo Alto	equinix-palo-alto-v4	AS8038 - 50.240.195.137	Amazon.com	AS18509 - 198.32.176.36	Peer	0 / 500	Idle	
Equinix Palo Alto	equinix-palo-alto-v6	AS8038 - 50.240.195.137	VODAFONE	AS3209 - 2001:504:d::7b	Peer	0 / no max	Idle	

Peer Groups

The Peer Group Gadget allows you to add peer groups for IPv4 and IPv6 for a selected exchange from a router's Resource Entry page.

Peer Groups

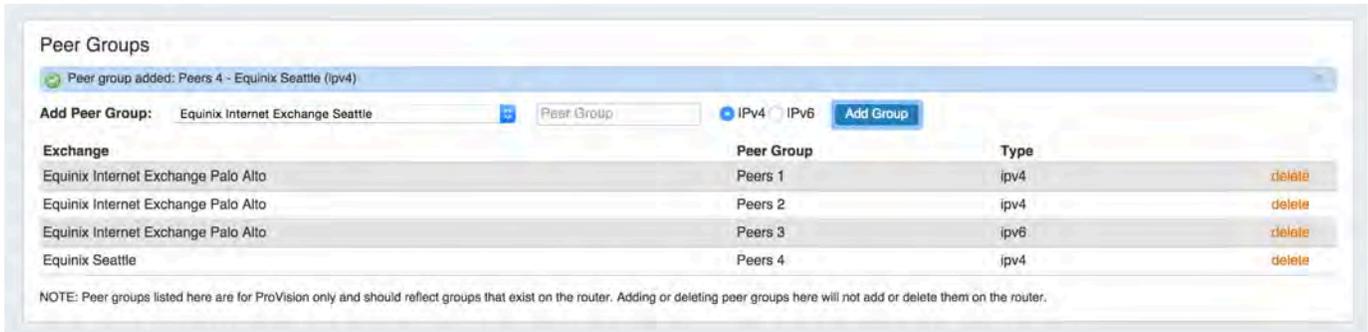

Add Peer Group: IPv4 IPv6

Exchange	Peer Group	Type	
Equinix Internet Exchange Palo Alto	Peers 1	ipv4	
Equinix Internet Exchange Palo Alto	Peers 2	ipv4	
Equinix Internet Exchange Palo Alto	Peers 3	ipv6	

NOTE: Peer groups listed here are for ProVision only and should reflect groups that exist on the router. Adding or deleting peer groups here will not add or delete them on the router.

To do this, simply select the exchange, type in a Peer Group name in the text box, select IPv4 or IPv6, then click "Add Group".

Peer Groups added from this gadget will then be available to select in the "Add Session" dialog box in the [Peering](#) tab.

Note

Peer groups listed in the Gadget are for ProVision only and should reflect groups that exist on the router.

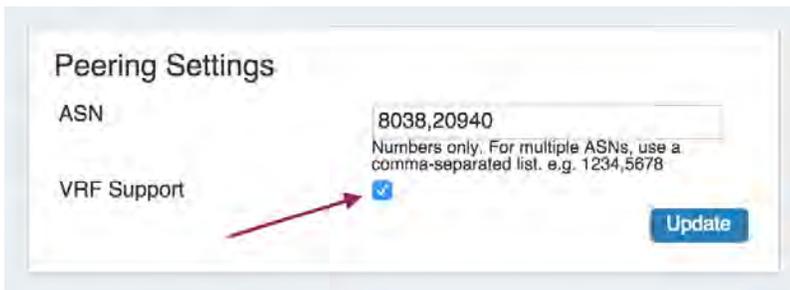

Adding or deleting peer groups from the Gadget will not add or delete them on the router.

For additional information on Peering, see [Peering v2](#).

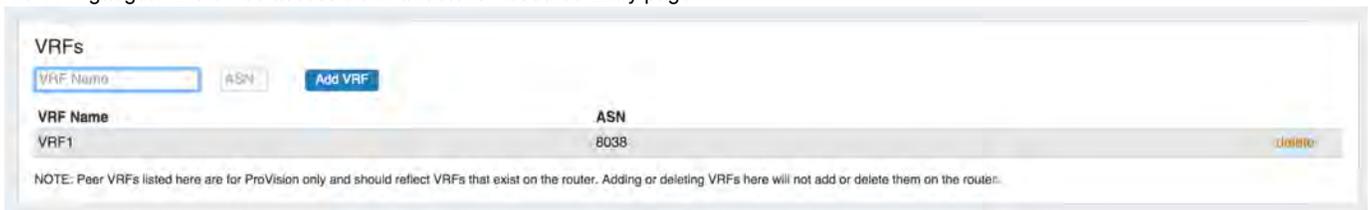

Peering VRF

The Peering VRF Gadget allows you to add VRFs from a router's Resource Entry page.

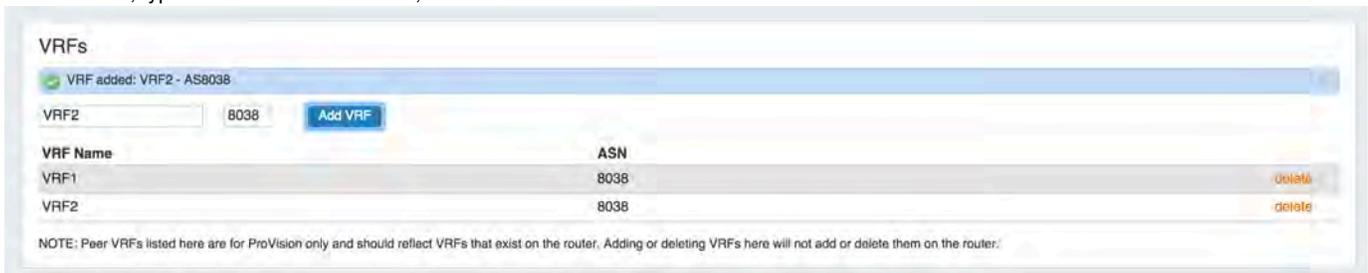

Enabling "VRF Support" in the Admin home page under "Peering Settings" will automatically add the VRF gadget to the router Section.

The VRF gadget will then be accessible in a router's Resource Entry page.

To add a VRF, type the VRF name and ASN, then hit "Add VRF".

To delete a VRF, click on "delete" next to the VRF entry in the gadget.

Once VRFs are set up for a router, the source ASNs for the associated VRFs will appear in the Source ASN dropdown when adding or editing a session for that router from the [Peering](#) tab.

Add Session

Type: Peer

Exchange: Equinix Palo Alto

Note:

Peer Group: Peers 1 - Ipv4

MD5:

Max Prefixes:

Source

Router: lab1-cisco - 50.240.195.12

ASN:

- AS8038
- AS20940
- AS8038 - VRF1
- AS8038 - VRF2

Destination

Select peer and public IP data PeeringDB or specify custom data for the session.

Peer: Peer Name

Public IP: Public IP (from PeeringDB)

Peer:

ASN:

IP Address:

Configure router after saving?

Peering VRF currently only supports Cisco routers.

Resource Linkage Gadget

The Resource Linkage Gadget allows you link a Resource to other Resources, and display the links in one place, without needing a hierarchy relationship. This gives you more flexibility to centralize data without requiring direct relationships.

To use the Resource Linkage Gadget, first, ensure that "Resource Linkage" is enabled under "Manage Gadgets" for the Section type of the Resource being used.

At this step, an empty Resource Linkage Gadget is displayed on the Resource's Entry page.

Resource Linkage

ID	Name	Custom ID	Section	Comment
Resource list is empty				

Add a new link by clicking the "Add New" button. Search for the desired Resource to add, select, and then click the "Add" button. The linked Resource will show in the Resource list.

Resource Linkage

ID	Name	Custom ID	Section	Comment
Resource list is empty				
6connect Labz				<input type="button" value="Add"/>

Save your changes by clicking the "Save Changes" button to finalize your selection.

Once a resource link has been saved, you may click on the link to go to the linked Resource's Entry page, or use the Action Menu (wrench icon) to Edit or Delete the link.

Edit a Resource Link

Editing a link allows for comments to be added to a link inside the Resource Linkage Gadget. Click on the link's Action Menu (wrench icon), and select "Edit" from the menu.

Type in the desired comment for the link, and click "Done" when complete and then hitting "Save Changes", or you may exit out by clicking "Cancel".

Delete a Resource Link

To delete a Resource Link, click the Action Menu (wrench icon) for the desired link in the list, then select "Delete" from the menu.

Reorder Resource Links

The Resource list in the Resource Linkage Gadget may be manually reordered. To move a link to a different position in the list, click the List icon at the beginning of the row, then click and drag to the desired position and release. After reordering, click "Save Changes" at the bottom right corner of the gadget to finalize your changes.

Reverse API Console

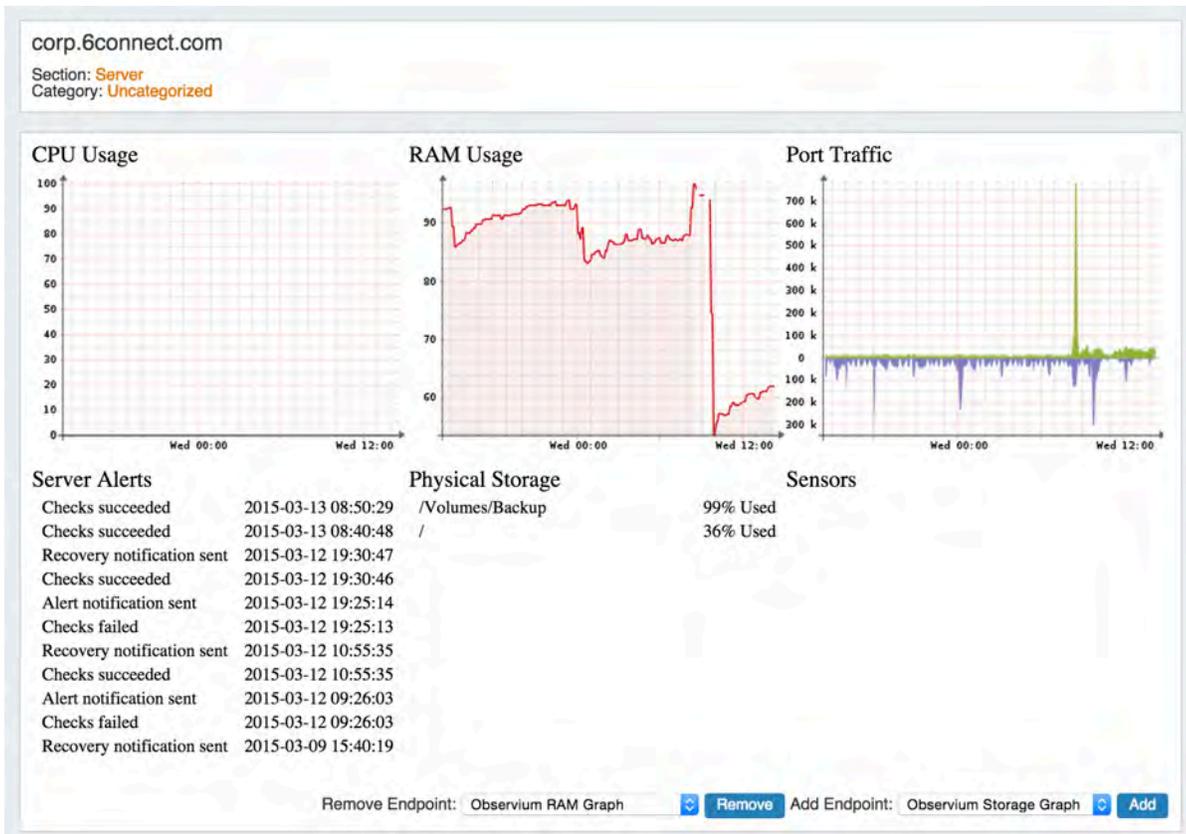

The Reverse API Console Gadget allows you to add endpoints from a Resource Entry page, and view customizable javascript displays set for the selected endpoint. The Reverse API Console may be added to any type of Section / Resource, and must be enabled for a Resource for certain rAPI processes to successfully complete.

After adding the gadget to a section, the Reverse API console will appear as whitespace with the option to add an endpoint display. Endpoints must already be created via rAPI or through the [Admin Reverse API interface](#) in ProVision to be selectable via the gadget.

Selecting an Endpoint and clicking "Add" will allow the javascript display code (added via rAPI or the [Admin Reverse API interface](#)) associated with that endpoint to display on the Resource Entry page.

An example display might be integrating Observium to display server status modules and alerts for Resources with the "Server" Section:

As a completely customizable area, displays can be designed to meet individual Resource needs - create charts, alerts, command buttons, or any other type of data that you wish to view.

Creating your own Gadgets

6connect provides XML specifications for users interested in creating their own gadgets for ProVision. See the [XML Specifications](#) section linked

below for more information.

User created gadgets are not supported at this time and the specification below could change without notice. If you want to make your own gadget, please get in touch so we can help you

- [XML Specifications](#)

XML Specifications

XML Specifications

THIS IS AN EXPERIMENTAL FEATURE

User created gadgets are not supported at this time and the specification below could change without notice. If you want to make your own gadget, please get in touch so we can help you.

- XML Specifications
 - XML Specification
 - Implemented Tags
 - Example
 - Fields

XML Specification

The XML gadget specification is based on the Atlassian Gadgets.

Implemented Tags

The implemented tags and corresponding attributes are:

- ModulePrefs
 - Description
 - title
 - width - "full" or "half" are the only options for now
- ContentSources
 - type - "file" uses the file given in src, "html" uses the content in the tag (eg. <Content type="html">This is the content</Content>)
 - src - relative filename or url
- Source
 - Fields
 - type - "css" or "javascript"
 - src - relative filename or url
- Field
 - slug

Example

```
<?xml version="1.0" encoding="UTF-8" ?>
<Module>
  <ModulePrefs title="Contact Info" width="half" />
  <Description>This gadget adds a field editor for fields related to contact info
(phone, address, ect).</Description>
  <Content type="file" src="template.html" />
  <Sources>
    <Source type="javascript" src="script.js" />
  </Sources>
  <Fields>
    <Field slug="6c-resourceholder-phone-main" />
    <Field slug="6c-resourceholder-phone-fax" />
  </Fields>
</Module>
```

Fields

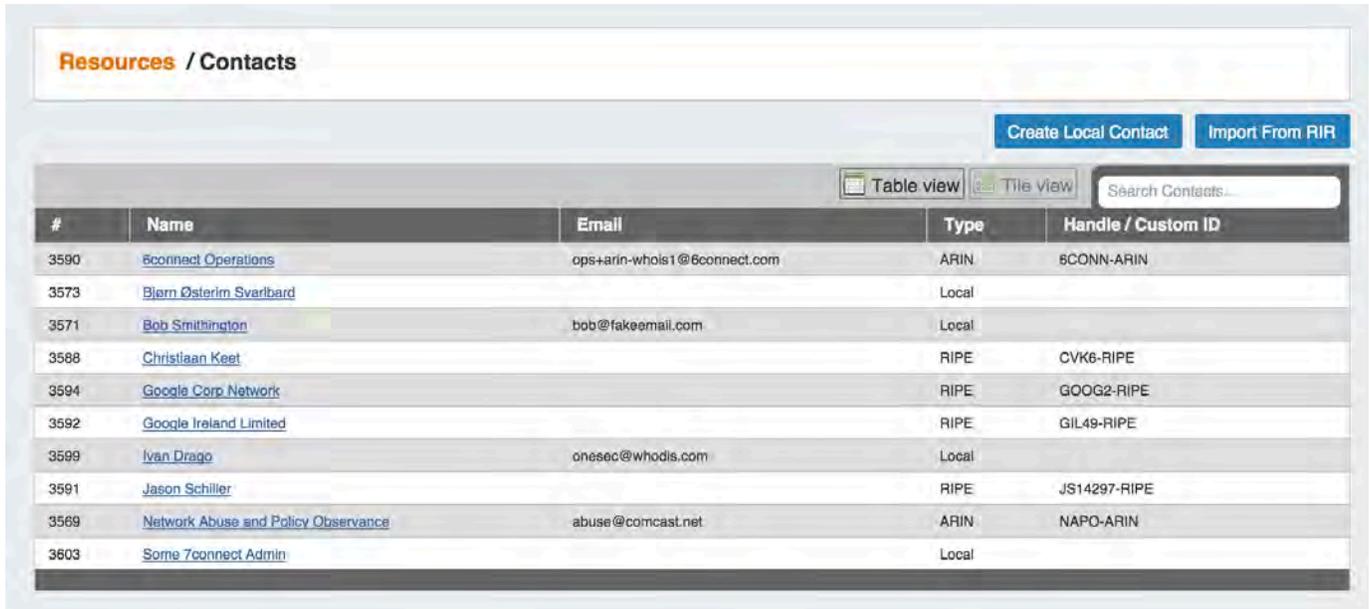

If a gadget uses fields, you can optionally add the slug of the field in this section to hide it from the main field list.

This can be very useful and make your Resource Sections easier to work with. If the fields are not hidden, this can lead to long lists of redundant data in multiple places and can cause confusion. However, all viewing and editing of the field will have to be done through the gadget. If your gadget uses a field in a read-only manner, then you should **not** add it to the gadget's manifest because that would prevent users from editing the field data through the standard edit page.

Contact Manager

Contact Manager

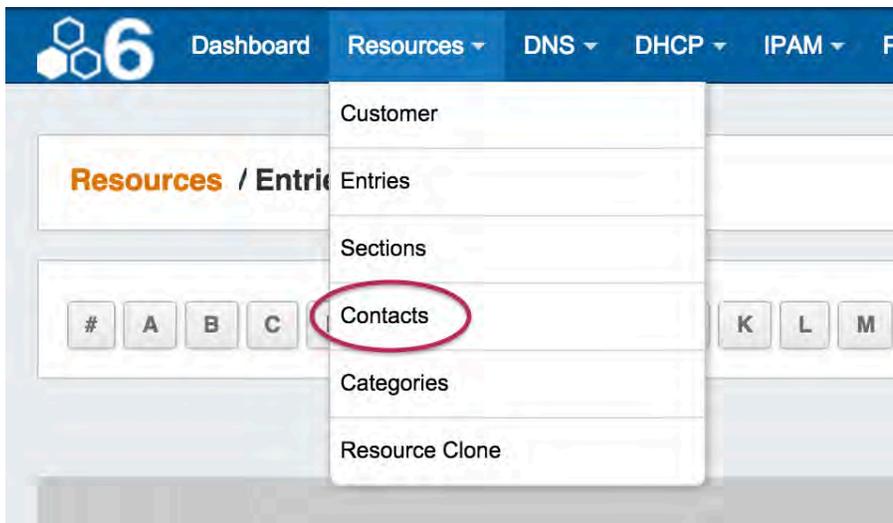

The Contact Manager lists and imports contacts into ProVision. You can create new contacts manually, or import contacts from RIR. Contacts may then be assigned to ProVision resources through the Contacts Gadget.

The screenshot shows the 'Resources / Contacts' page. At the top right, there are buttons for 'Create Local Contact' and 'Import From RIR'. Below these are 'Table view' and 'Tile view' options, and a search bar labeled 'Search Contacts...'. The main content is a table with the following data:

#	Name	Email	Type	Handle / Custom ID
3590	6connect Operations	ops+arin-whols1@6connect.com	ARIN	6CONN-ARIN
3573	Bjorn Østerim Svarbard		Local	
3571	Bob Smithington	bob@fakeemail.com	Local	
3588	Christiaan Keet		RIPE	CVK6-RIPE
3594	Google Corp Network		RIPE	GOOG2-RIPE
3592	Google Ireland Limited		RIPE	GIL49-RIPE
3599	Ivan Drago	onsec@whodis.com	Local	
3591	Jason Schiller		RIPE	JS14297-RIPE
3569	Network Abuse and Policy Observance	abuse@comcast.net	ARIN	NAPO-ARIN
3603	Some 7connect Admin		Local	

The Contact Manager is accessed from the Resource tab dropdown menu, under "Contacts"

- Contact Manager
 - UI Overview
 - Table View
 - Tile View
 - View Contact Details
 - Create New Contact
 - Import Contact from RIR
 - 1) Select RIR / Type
 - 2) Enter Point of Contact Handle
 - 3) Verify and Add
 - Edit or Delete Contact
- Working with the Contacts Gadget
 - Assigning a Contact to a Resource

- Assign the Contact
- Create a Contact Role
- Assign a Role to a Contact
- Delete a Role from the Roles List
- Unassign a Contact
- View the Contact Details Page

UI Overview

Table View

Table View shows contacts in list form, their ID number, email, contact type, and their handle /custom ID. If the contact was manually created through the "Create New Contact" button, it will show as type "Local", whereas a contact imported from RIR will show of type "RIPE" or "ARIN".

#	Name	Email	Type	Handle / Custom ID
3590	Econnect Operations	ops+arin-whols1@econnect.com	ARIN	5CONN-ARIN
3573	Bjørn Østerim Svarbard		Local	
3571	Bob Smithington	bob@fakeemail.com	Local	
3588	Christiaan Keet		RIPE	CVK6-RIPE
3594	Google Corp Network		RIPE	GOOG2-RIPE
3592	Google Ireland Limited		RIPE	GIL49-RIPE
3599	Ivan Drago	onesec@whodis.com	Local	
3591	Jason Schiller		RIPE	JS14297-RIPE
3569	Network Abuse and Policy Observance	abuse@comcast.net	ARIN	NAPO-ARIN
3603	Some Econnect Admin		Local	

Tile View

Tile view allows you to see all current contacts as a snapshot of basic information, based on contact type:

Base Contacts: Shows Contact Name, Email, and Phone

ARIN Contacts: Shows Contact Name, Company, Email, and Phone (if provided in ARIN)

RIPE Contacts: Shows Contact Name, nic-handle, maintained by, and phone (if provided in RIPE).

Clicking on the contact name on the header of the tile takes you to the contact's detail information page.

Contact Count					
BASE: 4	ARIN: 2	RIPE: 4	LACNIC: 0	AFRINIC: 0	APNIC: 0

At the bottom of the Tile View page, counts of current contacts by RIR as well as an image map are provided. At this time, only Base (Local), ARIN, and RIPE contacts are supported.

View Contact Details

To view the contact details, click on the contact's name in either list or tile view. You will be taken to the contact details page.

A Local contact created in ProVision will have modules shown for Address, Email/Phone, and Comments, as well as a list of any resources that contact is assigned to via the Contacts gadget.

You may edit or delete a Local contact by clicking the "Edit" button at the bottom of the page.

Notes / Comments

Create

When done filling out the information fields, hit the "Create" button to save your contact.

Parent

The parent field relates the contact to a resource's permissions structure, only allowing users with permissions for that resource to view and assign the affiliated contact(s). To allow the contact to be viewed globally in ProVision, check the "Global Contact" box above the Parent Field.

Import Contact from RIR

To import a contact from ARIN or RIPE, click the "Import from RIR" button from the contacts page.

Resources / Contacts

Create Local Contact **Import From RIR**

1) Select RIR / Type

Once on the the Import from RIR page, on the left hand side of the page select the RIR from which you wish to import - ARIN or RIPE.

If you select RIPE, you will also be prompted to choose whether you are importing a "Person" or "Role".

2) Enter Point of Contact Handle

After selecting the RIR / Type (if applicable), enter the ARIN or RIPE Point of Contact Handle for the contact you are importing, then click "Search".

Point of Contact Handle is the only search term that is valid. Attempting to search by name or keyword is not valid, and will return an error.

3) Verify and Add

If the search is successful, the found contact information will display at the bottom of the screen. If this is the information you wish to add into ProVision, click the "Yes" button on the right hand side of the page under "Would you like to add this RIPE contact to 6connect?". Otherwise, you may hit "No" to decline adding, or cancel and return to the index.

Select RIR
 RIPE

Select Type
 Role

Search RIPE
 GOOG2-RIPE Search

Results

role: Google Corp Network
 address: Brandschenkestrasse 110, Zurich 8002, Switzerland
 nic-hdl: GOOG2-RIPE

Working with the Contacts Gadget

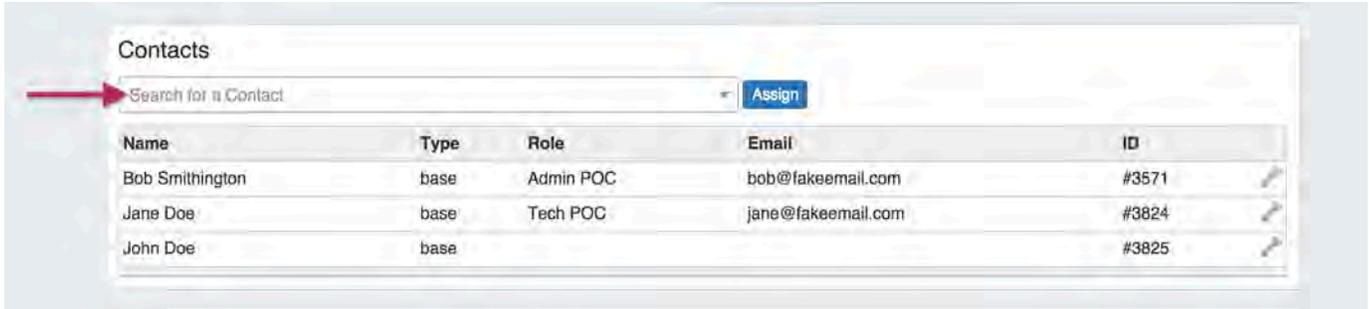

Assigning a Contact to a Resource

Contacts may be assigned to a resource through the [Contacts gadget](#). To add a gadget to a Resource's Entry page, see [Customizing Sections and Gadgets](#).

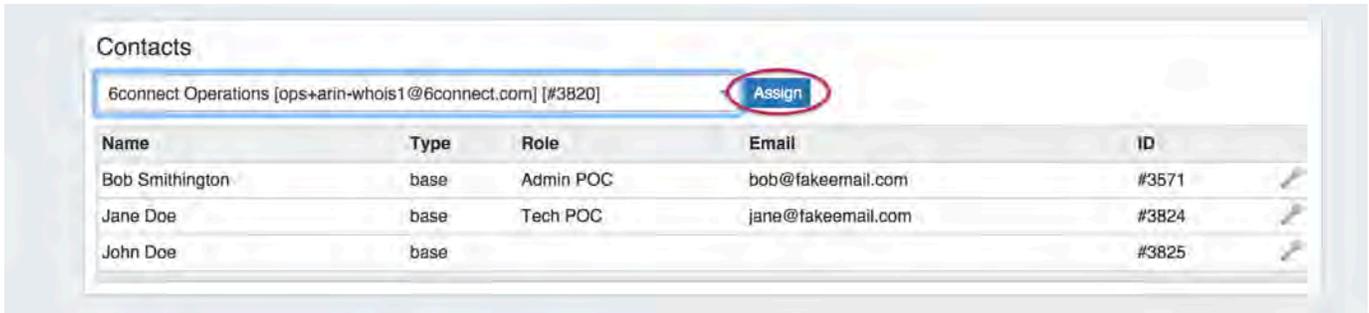

Once the Contacts gadget has been added to the desired Section, go to the Resource Entry page for the Resource you wish to assign the contact to, and navigate to the Contacts gadget.

Assign the Contact

In the Contact Gadget, search for a contact by typing the first few letters of the contact name in the search box, then click on the desired contact.

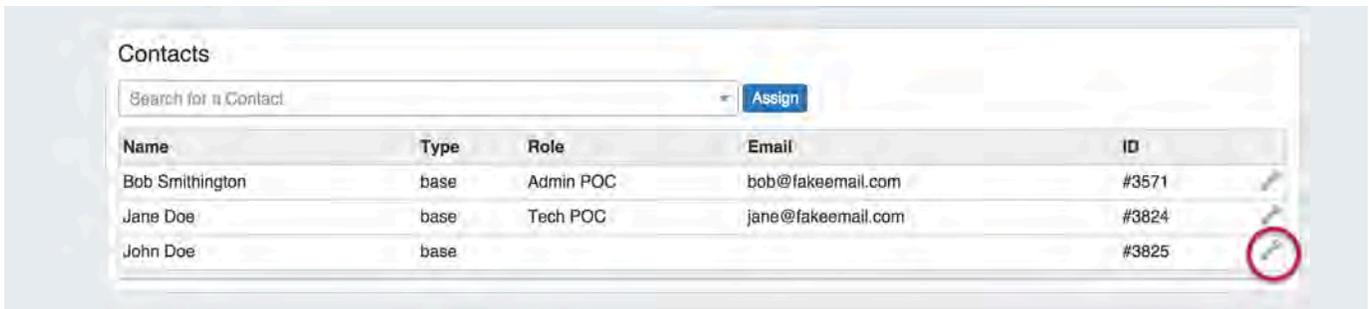

Then hit "Assign".

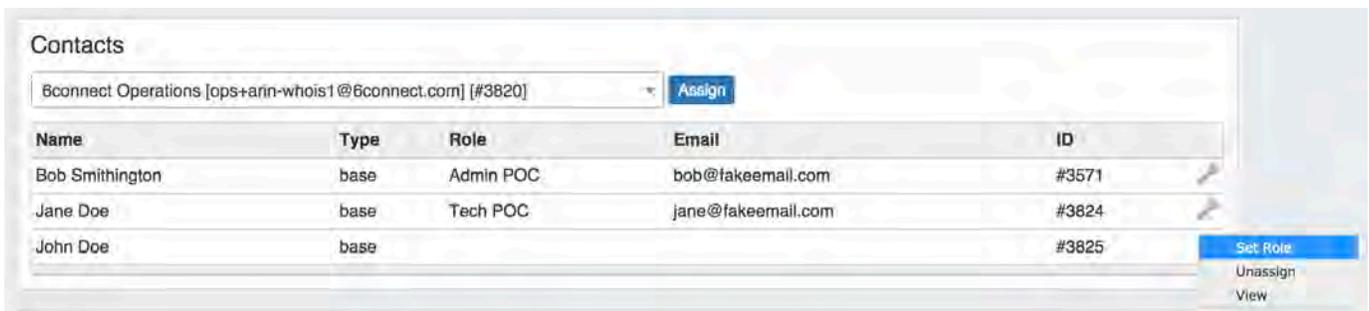

The Contact will show in the list below.

Create a Contact Role

Once a contact has been assigned, you can create and set a role for the contact by clicking on the Action Menu (wrench icon).

Select "Set Role"

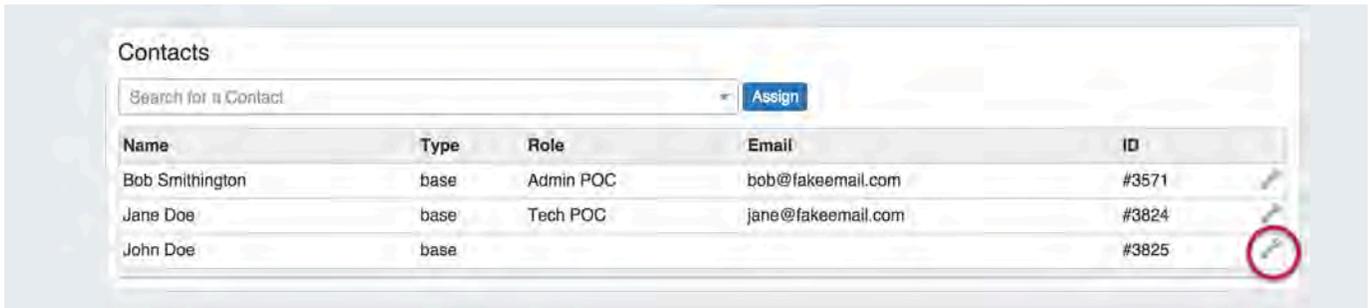

Under the "Add New Role" section, type in the desired role name and click the "Add" button.

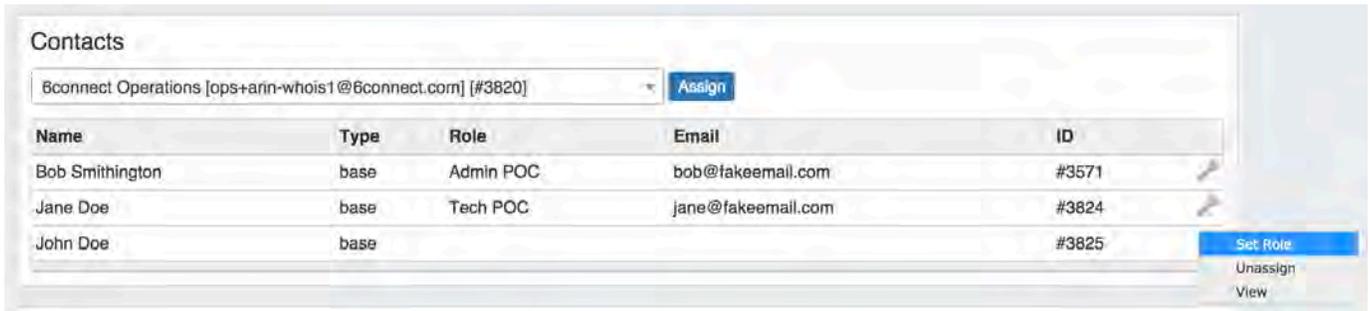

Assign a Role to a Contact

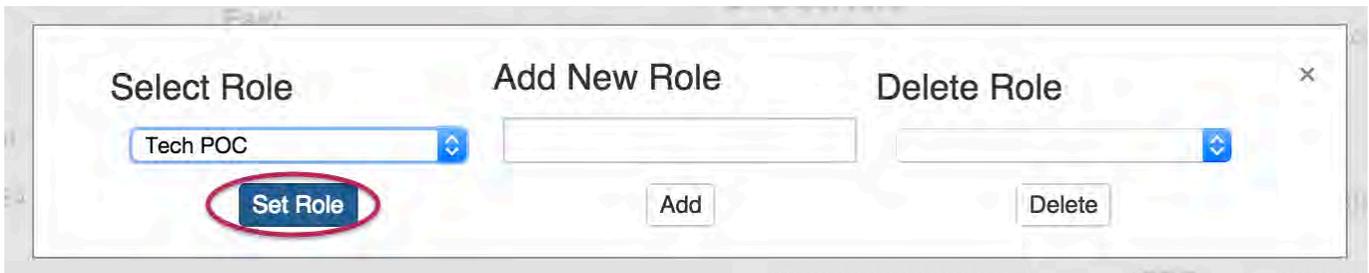

Once a contact has been assigned, you can set a role for the contact by clicking on the Action Menu (wrench icon).

Select "Set Role"

Under the "Select Role" section, choose the desired Role from the dropdown list, and click the "Set Role" button.

Delete a Role from the Roles List

Select "Set Role"

Contacts

6connect Operations [ops+arin-whois1@6connect.com] [#3820] Assign

DNS Tab

DNSv3

ProVision's DNSv3 combines server management, group organization, and zone management under the [DNS](#) tab.

The screenshot shows the ProVision DNSv3 interface. At the top is a navigation bar with links for Dashboard, Resources, DNS, DHCP, IPAM, Peering, Log, and Reporting. A search bar is on the right. Below the navigation bar are three sub-tabs: DNS Groups, DNS Servers, and DNS Zones. The main content area is titled "DNS Groups List" with an "Add Group" button. A descriptive text block explains that DNS Groups help organize zones and servers. Below this is a "Default Group" section with buttons for "Add Zone", "Push Group", "Schedule Push", and "Export Zones". There are also tabs for "Forward Zones" and "Reverse Zones". A table lists DNS zones with columns for Zone Name, Last Pushed, Last Modified, Records, Zone Status, and Actions. The table contains three rows of zone data.

Zone Name	Last Pushed	Last Modified	Records	Zone Status	Actions
aaAnotherZone.net.		08/03/2017 14:57:24	2		Delete Push Move Check
aaSomeZone.net.		08/03/2017 14:56:50	2		Delete Push Move Check
abcZone.com.		08/03/2017 14:58:03	2		Delete Push Move Check

The [DNS](#) tab contains three sub-tabs: [DNS Groups](#), [DNS Servers](#), and [DNS Zones](#).

The [DNS Groups](#) tab is where DNS Groups, zones, ACL's, and default SOA values are managed. The [DNS](#) tab [Groups List](#) allows you to create, view, and manage groups of DNS Servers and Zones. Using groups, you can configure and push selected combinations of zones at one time.

The [DNS Servers](#) tab is only accessible to Admin users, and contains functions for adding, updating, and managing DNS servers as well as scheduling server tasks. For Admin-level DSN tasks, see [DNS Administration](#) and [Working with DNS Servers](#).

The [DNS Zones](#) tab lists all the zones in ProVision able to be viewed by the user, in the same format as on the [DNS Groups](#) page, but without the Group organization. The Zone List allows you to view, add, delete, and push individual DNS Zones.

- [DNSv3](#)
 - [DNSv3 Overview](#)
 - [DNSv3 Permissions](#)
 - [DNSv3 Workflow](#)
 - [Additional Information](#)

DNSv3 Overview

DNSv3 reorganizes ProVision's DNS system into a more unified and accessible interface, combining both admin and non-admin DNS tasks together under the [DNS](#) tab.

In DNSv3, zones are gathered under DNS Groups, servers are attached to those Groups, and Nameservers, Default SOA values, and ACLs are managed at a per-Group level. Users can then view and manage Groups, individual zones, default SOA values, ACLs, attach servers, and perform pushes all on the same page.

DNSv3 Permissions

DNSv3 (6.0.0 release), restructures DNS to incorporate DNS zones and Groups into ProVision's Resource System. Zones and Groups are Resources just like Customers, Servers, Routers, or Contacts (See [Resource Concepts](#) for a more detailed explanation of Resources in ProVision).

This allows for DNS zones and Group permissions to be managed similarly to other ProVision resources, where users with Resource permissions (Create / Read / Update / Delete) on the parent resource of the DNS Group can create groups and zones, manage those groups and zones, push (if a server is attached), and delete.

A user with full Resource permissions on a DNS Server, as well as the parent resource of a Group, may view and attach that server to a Group.

Users with Admin permissions can access the **DNS Servers** area under the **DNS** tab manage DNS server creation, edits, and deletion.

For more information on setting up permissions groups in ProVision, see [Users & Permissions](#).

DNSv3 Workflow

DNSv3 revolves around Groups. Zones are gathered under Groups, servers attached to Groups, and pushes may be done on a per Group level. Thus, the first workflow step in DNSv3 is to set up one or more DNS Groups. A "Default Group" is automatically provided in ProVision, but other Groups may be desired to organize zones and default values.

To create a new DNS Group, click the "Add Group" button from the **DNS Groups** tab. Enter the desired default values for the Group, and save. If only using the Default Group, ensure the default parameter values are set as needed. For more information, see [Working with DNS Groups](#).

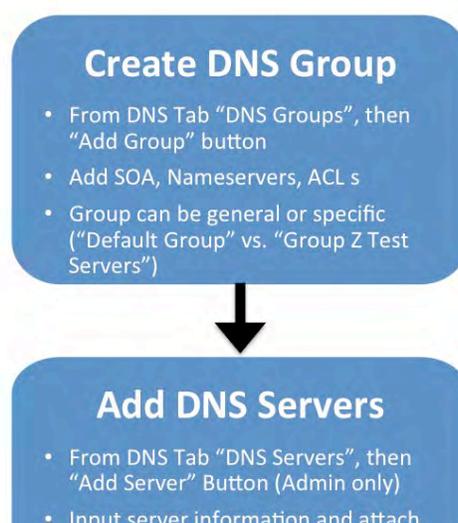

After Groups have been set up, DNS servers should be added or settings verified. Admin users may add DNS servers from the **DNS Servers** tab "Add Server" button. Input the server information and save. Existing servers may be reviewed and edited by clicking on the server name in the DNS Server List. Once a server is created in ProVision, it may be attached to any DNS Group under the Group's "Attached Servers" module. Attaching a server to a Group will allow for zones in that group to be pushed to the attached server(s). See [Working with DNS Servers](#).

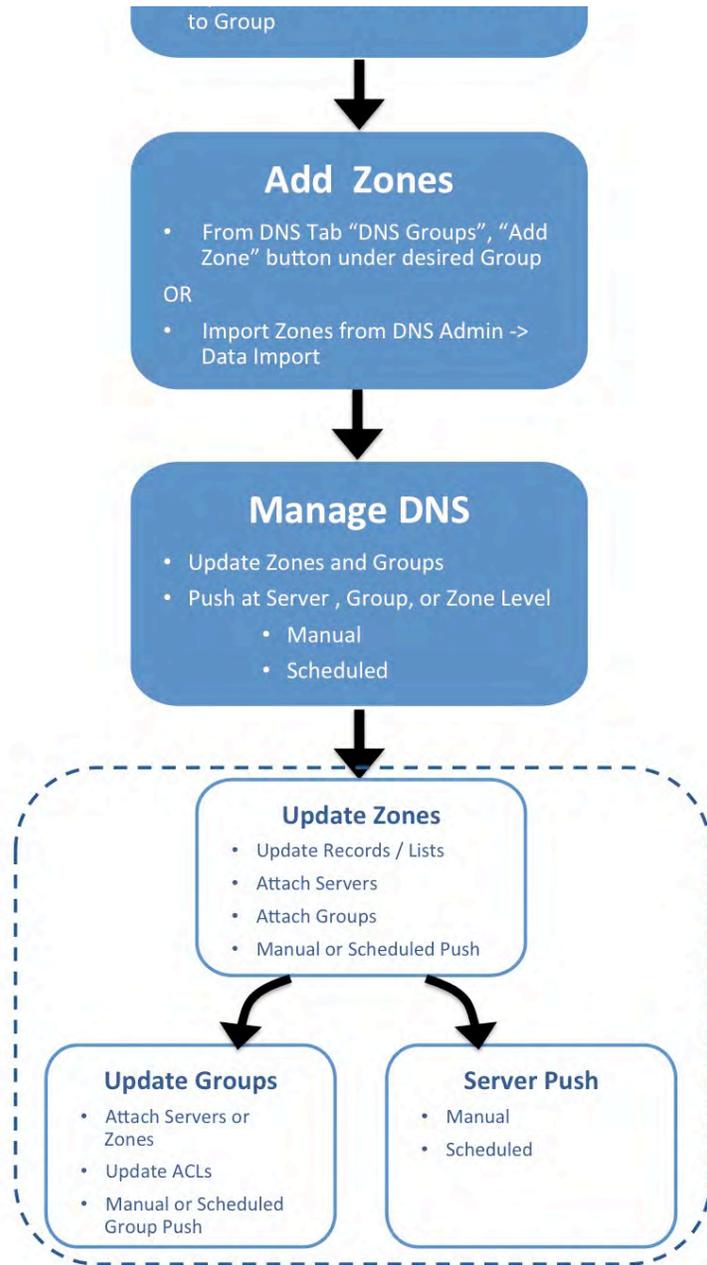

Next, add zones to your groups. Zones may be manually added under each group by clicking the "Add Zone" button in the DNS Groups or DNS Zones tabs, or it may be imported via [DNS Importers](#) into a selected Group. Add the zone and record information, and save. See [Working with DNS Zones - Common Tasks](#) for additional information.

Zones may be only exist once per Group, but may be duplicated under multiple Groups. Zones may also be moved from Group to Group as needed.

At this point, all major components of the ProVision DNS system have been added - from here management tasks take over. Zones may be updated and moved to or from Groups; Groups may be edited with different default values or servers, and pushes maybe be performed for an individual zone, a full Group, or for an entire server. Pushes may be manual or scheduled for a future time through the Scheduler.

Attached Servers >

Group Default Parameters >

Applied ACLs >

Scheduled Tasks >

1) **Add Group Button:** Opens a dialog for creating a DNS Group

2) **Group Container:** The Group container header shows the group name. Expand or close the group container by clicking on the expansion arrow (>) on the far right of the header. Clicking on the X will delete the Group and all zones included in the group. Rename the group by clicking on the name, then typing the desired changes and clicking outside of the name.

Group Zone Actions:

3) **Add Zone Button:** Opens a dialog for creating a DNS zone under that group.

4) **Push Group Button:** Pushes all zones in the group.

5) **Schedule Push Button:** Schedules a push of all zones in the group to the selected day and time. Requires the scheduler tab / cron tasks to be enabled.

6) **Export Zones:** Exports all zones in the group into a .zip file.

7) **Zone List:** Forward and reverse zones included in the Group.

8) **Forward / Reverse Zones Tabs:** Shows zone list containing only forward or reverse zones, respectively.

9) **Zone Name (Sortable):** The name of the zone. Clicking on the zone name will open the zone details window, showing individual records. Clicking on the "Zone Name" header will sort the zone list by ascending or descending by name.

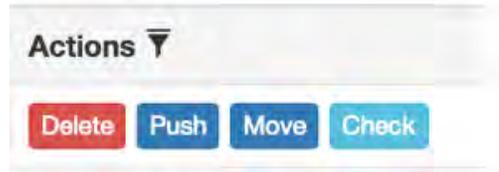

10) **Last Pushed:** The date and time the zone was last pushed.

11) **Last Modified (Sortable).** The date and time the zone was last modified. Clicking on the "Last Modified" header will sort the zone list by most / least recent modification date.

12) **Records:** How many records are in the zone.

13) Zone Status: Will notify if the zone or server connection contains errors, after a check has been performed (by clicking on the "Check" button). Clicking on the "Contains Errors" message will provide additional details on the error.

14) Actions: The actions that may be performed on each zone:

15) Delete: Deletes the zone from ProVision and removes the entry in ProVision conf file on the remote server(s) (the user will also receive a prompt to confirm they wish to complete the action)

16) Push: Pushes the zone to the associated server.

17) Move: Moves the zone to a different Group.

18) Check: Performs a check on the zone, notifying the user if errors or warnings are present for the zone.

19) Attached Servers: Click on the header title or > to expand or collapse. View, attach, or detach a server from the group.

20) Group Default Parameters: Click on the header title or > to expand or collapse. Edit default group settings including nameservers and SOA values.

21) Applied ACLs: Click on the header title or > to expand or collapse. Add or detach ACLs to the group.

22) Scheduled Tasks: If a scheduled push has been set up for the group, the task information will show in a "Scheduled Tasks" module. Click on the header title or > to expand or collapse. Review or delete scheduled group pushes.

Working with DNS Groups

DNS Groups allow for organizing multiple zones together and linking those zones with one or more servers. Default nameservers, SOA values, and ACL's are set at the Group level, so different Groups may have their own default values. Zones may be pushed individually, as a Group, or at the server level.

ProVision automatically designates a Default Group for zones to be imported or added to, as well as a "templates" group for holding pre-DNSv3 templates or to hold new zones created as templates. Creating additional Groups is completely optional.

Add a Group

DNSv3 automatically contains two Groups - one Default Group to contain existing or imported zones, and a Templates Group, containing zones mimicking DNS Templates. Additional Groups may be added or removed at any time, and zones may be freely moved or duplicated between different groups as needed.

To create a new Group, from the [DNS](#) Tab, select the **DNS Groups** sub menu. Then, click the "Add Group" button next to "DNS Groups List".

This will open the "Create New Group" dialog.

Enter the desired Group Name, select a parent resource, enter the default SOA values, and add a default Nameserver (type the NS, then click "Add").

Click the "Save Changes" button when complete.

Create New Group ✕

Save changes

The new group will be added to the DNS Groups List.

Open the Group container for the new Group by clicking on the expansion arrow at the top right corner of the header.

Information for Attached Servers, Group Default Parameters, and Applied ACLs may also be viewed and edited by clicking on the expansion arrows for each section.

Edit a Group

Edit a Group Name:

Edit the name for a Group by clicking inside the Group's Name. A highlight box will appear around the name, and a cursor inside the box.

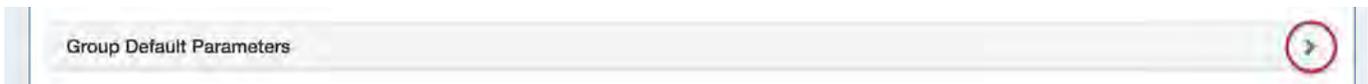

Edit the text as desired using your mouse or arrow keys to navigate through the text. When complete, click anywhere outside of the name box, and a confirmation dialog will appear.

Click "Confirm" to save your changes, or "Close" to exit without saving.

Edit a Group's Default Parameter Values:

Under the desired Group, expand the "Group Default Parameters" module by clicking on the expansion arrow.

Edit Nameservers

Change a Nameserver by typing the new NS record into the Nameserver box, then click "Add".

Group Default Parameters

Default Nameservers

The name servers are automatically added to any new zone files created.

NameServer:

Order	NS Record	
1	ns1.example.com.	✘

Delete the previous Nameserver by clicking on the red "X" to the right of the NS Record.

Group Default Parameters

Default Nameservers

The name servers are automatically added to any new zone files created.

NameServer:

Order	NS Record	
1	ns1.example.com.	✘
2	ns2.example.com.	✘

Change the order of multiple Nameservers by left-clicking (holding the mouse button down) over the NS Record to move, dragging to its desired placement, then releasing the mouse button.

The NS record will drop into its new location, with the order updated.

Group Default Parameters

Default Nameservers

The name servers are automatically added to any new zone files created.

NameServer:

Order	NS Record	
2	ns2.example.com.	✘
1	ns1.6connect.com.	✘

Edit SOA Values

To edit the Default SOA values, simply click inside the value to be changed and type or select your new value. Be sure to also verify the desired Parent Resource for the Group, as the resource selected determines the Group's permissions.

Default SOA Values

The values supplied here are the default SOA values used on all newly created zones.

someZone2.com.		05/31/2017 15:10:18	1		Delete Push Move Check

Attached Servers >

Group Default Parameters >

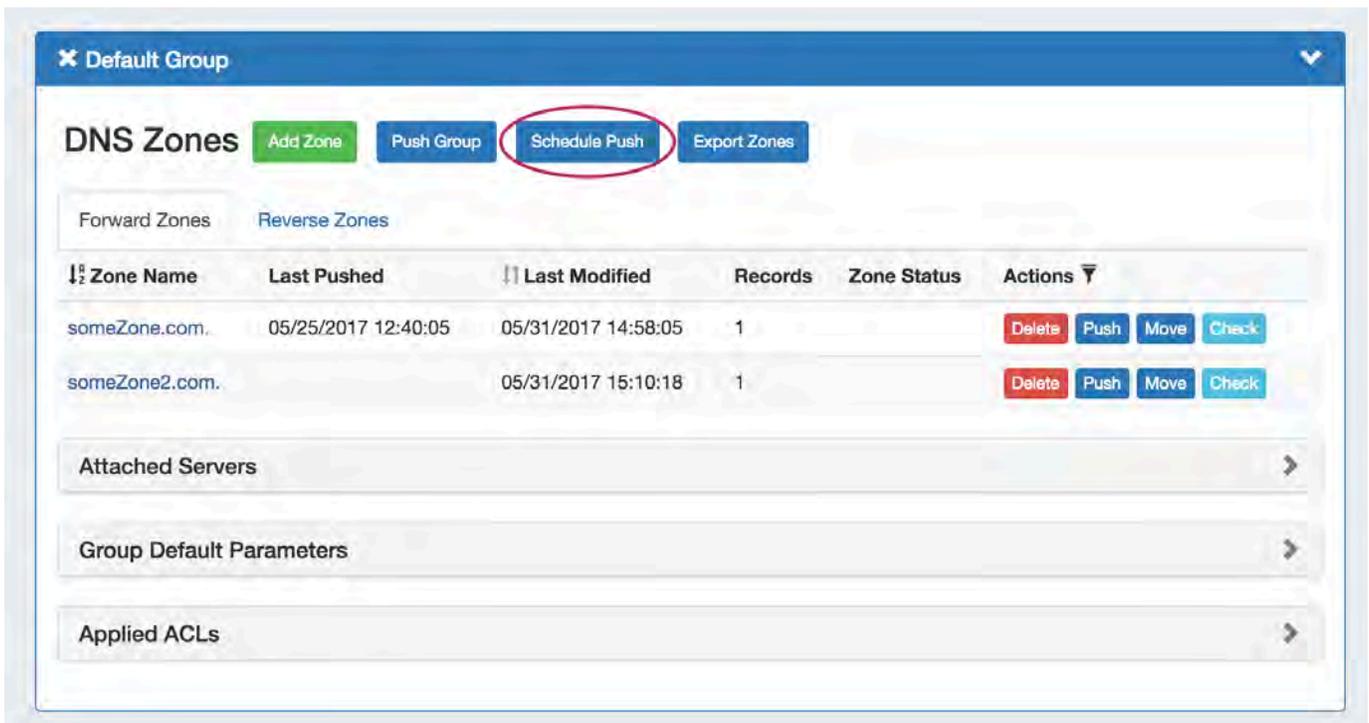

Applied ACLs >

A DNS Push Status window appears, showing each zone in the Group as it is pushed to the attached server. If successful, a green "Finished DNS Pushing Request" will appear as the final message. If errors occur, an error message will show with details on the issue. When complete, hit the "Close" button.

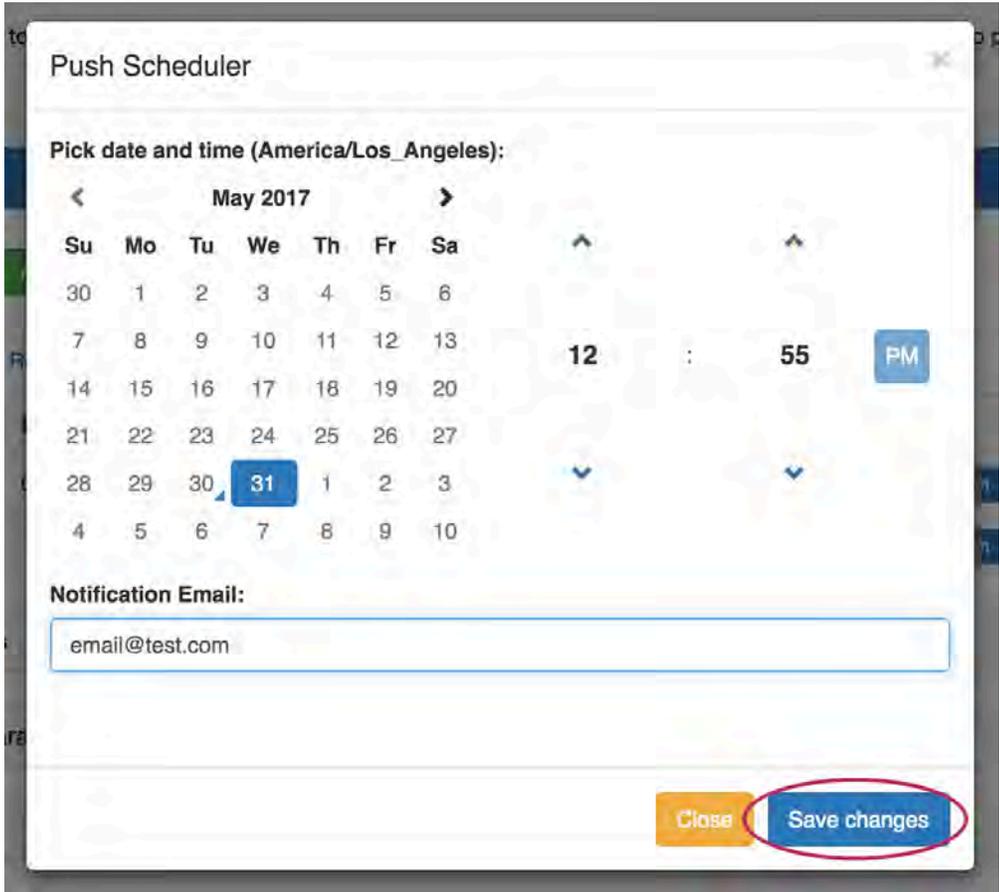

Scheduled Group Push

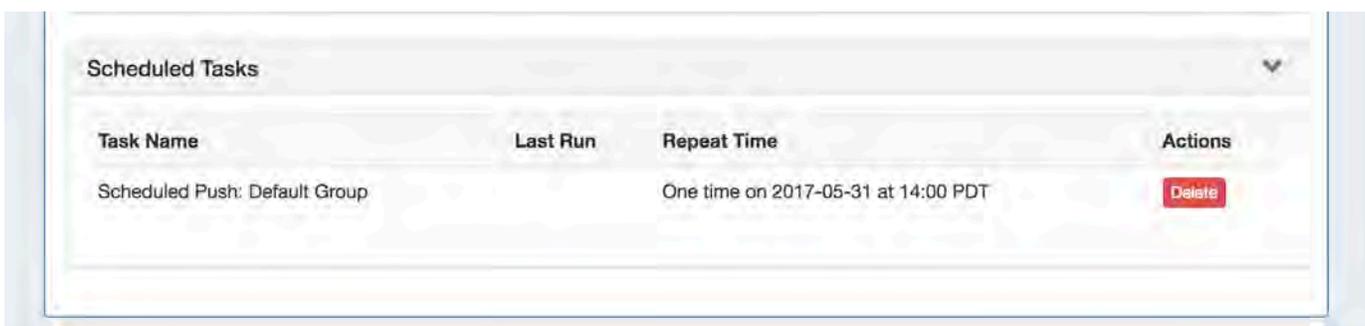

Scheduled pushes may be set up through the "Schedule Push" button for the Group.

Click "Schedule Push" for the Group, then select a date, time (12 hour, with AM / PM toggle), add a notification email address, and click "Save changes".

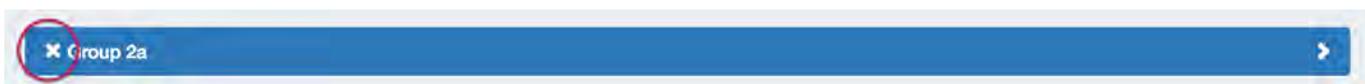

The Scheduled task will be shown in both the Group details (under "Scheduled Tasks") and the Admin Scheduler task list.

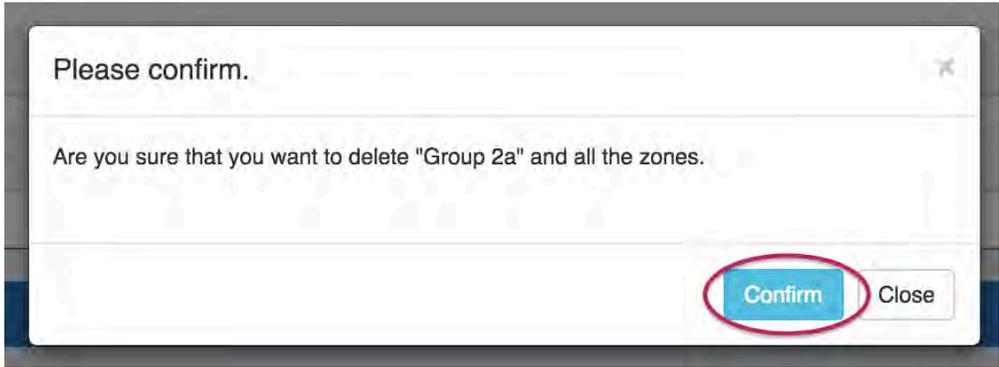

The task may be deleted prior to running by clicking the "delete" button, but will automatically be removed once completed.

Delete a Group

Delete a non-Default Group by clicking on the "X" to the left of the Group's name in the DNS Groups List.

A confirmation message will appear, click "Confirm" to save your changes, or "Close" to exit without saving.

The Default Group may not be deleted.

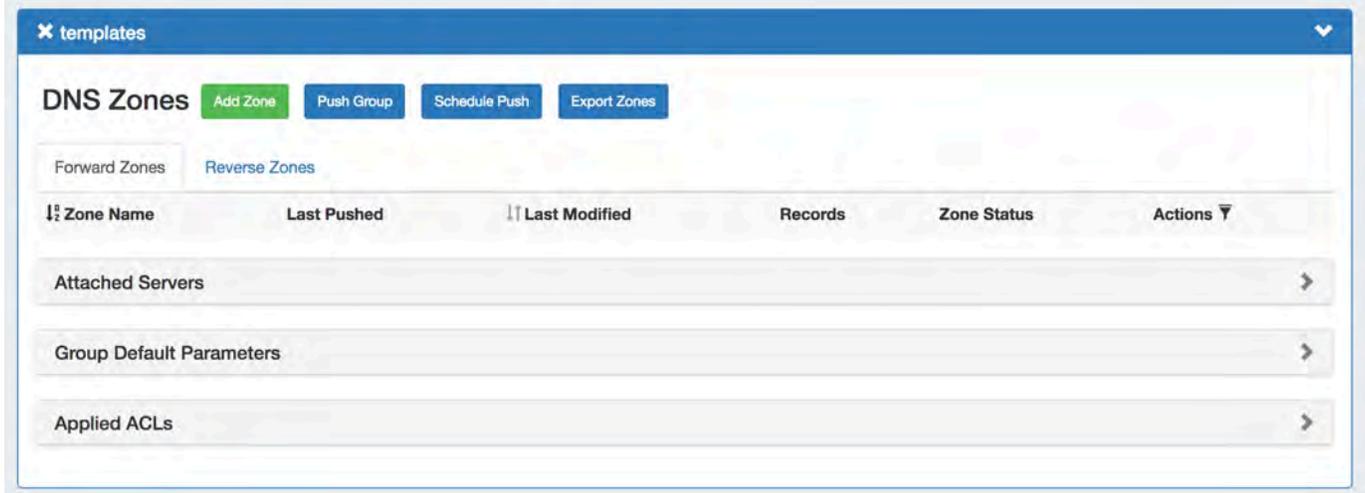

Export a Group

All zones under a DNS Group may be exported to a .zip file by clicking the "Export Zones" button at the top of the Group module. The exported .zip file may be used with ProVision's BIND DNS Zone Upload / Import tool.

Using the Templates Group / Cloning Zones to a Group

By default, a "templates" group is included in DNSv3. Any pre-DNSv3 DNS Templates will be included in this group, as well as any newly created zones to be used as template zones.

The template group functions the same as any other DNS Group, but gives a holding place for zones designed as templates separate from other zones.

Create your template zone

Add a template zone by clicking the "Add Zone" button, giving the zone a descriptive name to clearly identify as a template, select the populate type, and fill in any optional data. (see Working with DNS Zones - Add a Zone.)

Create New Zone

Zone Name: someZoneTemplate.com.

Working with DNS Zones - Common Tasks

Working with DNS Zones

The screenshot shows a web interface for managing DNS. At the top, there's a navigation bar with 'DNS' selected, and sub-tabs for 'DNS Groups' and 'DNS Zones'. The main content area is titled 'DNS Groups List' and includes a description of DNS Groups. Below this is a section for the 'Default Group' containing a 'DNS Zones' table with columns for Zone Name, Last Pushed, Last Modified, Records, Zone Status, and Actions. The table lists three zones: aaAnotherZone.net, aaSomeZone.net, and abcZone.com.

This page details some common DNS tasks performed from the [DNS](#) tab and DNS Gadget. DNS Zones are accessed under the [DNS](#) tab, [DNS Groups](#) or [DNS Zones](#) sub-tabs. Separate zone lists exist under each DNS Group.

Working with DNS Zones

Add a Zone

Add a new zone while in the **DNS Groups** tab by selecting "Add Zone" under the desired Group. You may also add new zones from the **DNS Zones** page, also by the "Add Zone" button. The "Create New Zone" dialog will pop up.

Create New Zone

Zone Name: ex: example.com.

DNS Group: Default Group

Parent Resource: Default Group

Populate with records

Populate type: Empty Zone

Optional Fields

Close Save changes

Enter the name of your new zone and select a parent resource, if desired. The DNS group will already be selected.

DNSv3 allows you to populate the zone with three options:

- Empty Zone - create the zone as an empty zone, and manually create records
- Populate by AXFR Transfer - transfer zones from an outside server
- Clone an existing zone - use an existing zone as a template, and manually edit as needed

From there, you may either save your changes and complete zone creation, or add in optional field details.

Optional Fields

Expand the "Optional Fields" section by clicking on the chevron (>) or the "Optional Fields" header.

Create New Zone

Zone Name:

DNS Group:

Parent Resource:

Populate with records

Populate type:

Optional Fields

Zone Host:

Zone Email:

Zone Serial:

Zone Refresh:

Zone Retry:

Zone Expiry:

Zone TTL:

Under this section, add in optional values for Zone Host, Email, Serial, Refresh, Retry, Expiry, or TTL.

When finished, click the "Save Changes" button.

To exit without saving, simply click "Close".

Edit / Manage a Zone (View Zone page)

Zones may be editing by clicking on the Zone name in any zone list in which it appears - the Zone List, zones listed under DNS Groups, or zones listed as attached to a server under DNS Servers.

Clicking on the zone name opens up the View Zone page, from where comments may be added, records added or updated, servers attached to the zone, advanced settings edited, backups restored or the zone pushed / exported. For details on the View Zone page, see [Editing DNS Zones](#).

Add a comment:

To add a comment to a zone, click anywhere inside the comment area and begin typing. The comment will be saved when an area outside of the comment box is clicked, deselecting the comment area.

Edit Advanced Settings:

Open the zone "Advanced Settings" section by clicking on the header or the expansion arrow (>). Edit fields as needed, and click "Save" when complete.

Advanced Settings

Parent Resource: Default Group
 The new zone resource will be a child of the Parent Resource.

Enable DNSSEC: OFF

Enable Dynamic Updates: OFF
 This feature is using the dynamic update functionality of the DNS Server. Every record that you modify/removes/create will be updated on the servers automatically without pushing the zone.

Also-Notify List: ex. 192.168.3.0; 10.10.3.0/24
 The list will be added to the also-notify list on the DNS servers that support this option.

Allow Update List: ex. 192.168.3.0; 10.10.3.0/24
 The list will be added to the allow-update list on the DNS servers that support this option.

Allow Transfer List: ex. 192.168.3.0;
 The list will be added to the allow-transfer list on the DNS servers that support this option. On exporting a zone to a master server, the slaves are automatically added !

Allow Notify List: ex. 10.1.0.15; 172.28.32.7;
 The list will be added to the allow-notify list on the DNS servers that support this option. On exporting a zone to a slave server, the masters are automatically added !

Free Lines (Dangerous):
 The content inside this field will be append to the zone section of the server configuration. Please be very careful with this field as it can cause configuration errors ! They are currently valid only for ISC Bind.

Add or Edit Zone Records

From the View Zone page, under DNS Records, look for the line "Add a new ___ Record". Select the desired record type, then click "Add". To edit an existing zone record, click on the record line in the DNS Records list.

DNS Records Select Record Type

Add a New Record

Record Type	Record Data	Actions
SOA	ns.example.com. hostmaster.example.com. (2017053100 172800 900 3600 900)	
NS	someZone2.com. maps to ns1.test.com.	<input type="button" value="Delete"/> <input type="button" value="Cancel"/>

The Edit Record dialog will open, allowing you to fill in record details.

Edit NS record

Type: NS

Host:

Value:

TTL:

Comment:

Skip Validation.

Record revisions

Date	Host	Value
2017-05-31 13:19:13	someZone2.com.	ns1.test.com.

Fill in the Host, Value, TTL, and comment if desired.

An option exists to "Skip Validation" - check to select if you wish to bypass validation for the record.

If previous versions of the record exist, the revision log will be visible under "Record revisions".

When edits or reviewing is complete, click "Save changes", or "Close" to exit without saving.

Delete Zone Records

Delete a zone record by clicking the "Delete" button under "Actions" for the desired record entry.

Attach / Detach Servers to a Zone

Under the "Attached Servers" section of the View Zone page, next to "Attach Server:", select the desired server to attach and choose the server type (Default, Master, Slave), then click the "Attach" button.

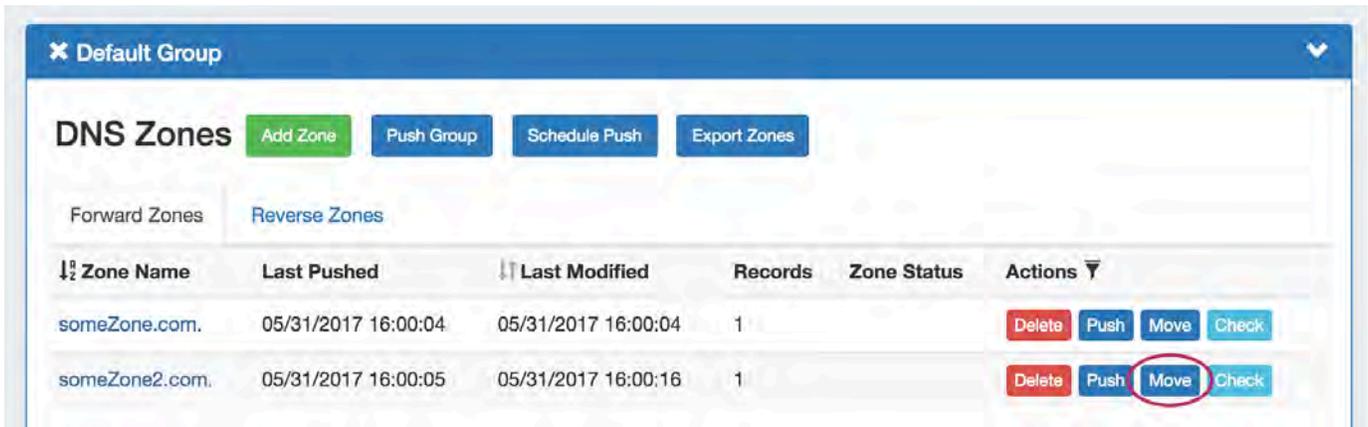

Attached Servers

Server Name	Server Backend	Server Type	Server Status	Actions
Attach server :	<input type="text" value="Select Server"/>	<input type="text" value="Use Default Type (Recommended)"/>	<input type="button" value="Attach"/>	

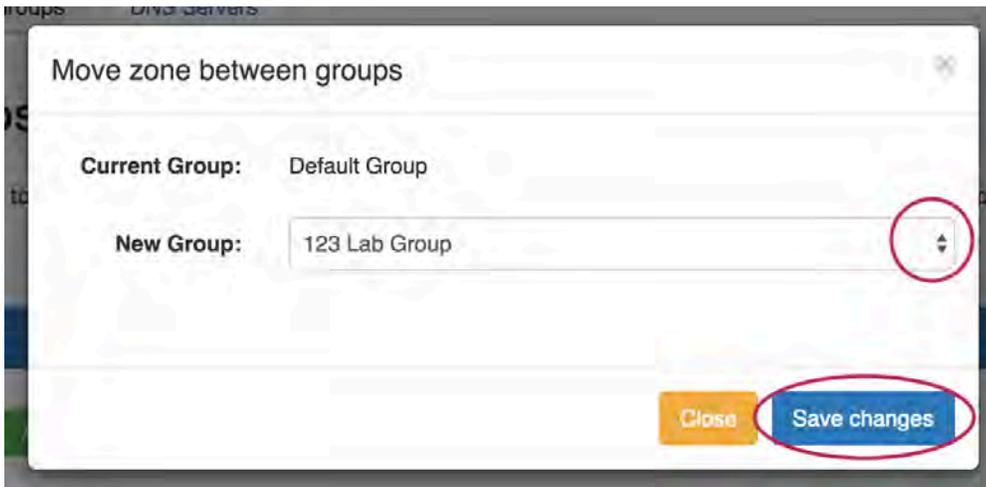

To detach a server from a zone, look for the server under the "Attached Servers" list, then click "Detach" under actions for that server.

Move Zones to a Different Group

Zones may be moved to a different Group than the one created under, by clicking the "Move" button in the zone's Actions menu.

The "Move Zone" modal will appear - select the new Group to move to the zone under, and click "Save Changes" to complete.

Pushing Zones

Zones may be pushed individually ("Push Zone Now"), as a scheduled future push ("Schedule Push"), or pushed as part of a Group or Server Push.

Push Now (from Group List):

To immediately push a single zone, navigate to the DNS Group the zone is under, then click the "Push" button in the Actions column for the zone. You may also look for the zone in the **DNS Zones** tab Zone List, and then likewise, click the "Push" button in the zone row.

Default Group

When a successful zone push is complete, a green "Finished DNS Pushing Request" message will appear, and the window may be closed.

Schedule Push (from View Zone page):

The View Zone page includes an option to schedule a zone push, similar to scheduling a Group push.

Click "Schedule Push" for the zone, then select a date, time (12 hour, with AM / PM toggle), add a notification email address, and click "Save changes".

The Scheduled task will be shown in both the Zone View page (under "Scheduled Tasks") and the Admin Scheduler task list.

The task may be deleted prior to running by clicking the "delete" button, but will automatically be removed once completed.

Schedule Push (Admin Scheduler):

Scheduled zone and server pushes may also be set up by Admin users from the [Scheduler](#) tab. For more information, see the [Scheduler](#) documentation.

Group Push:

All zones contained in a DNS Group may be pushed at the same time, by pushing the DNS Group.

For information on working with DNS Groups, including performing a manual or scheduled Group push, see [Working with DNS Groups - Pushing a Group](#).

Server Push:

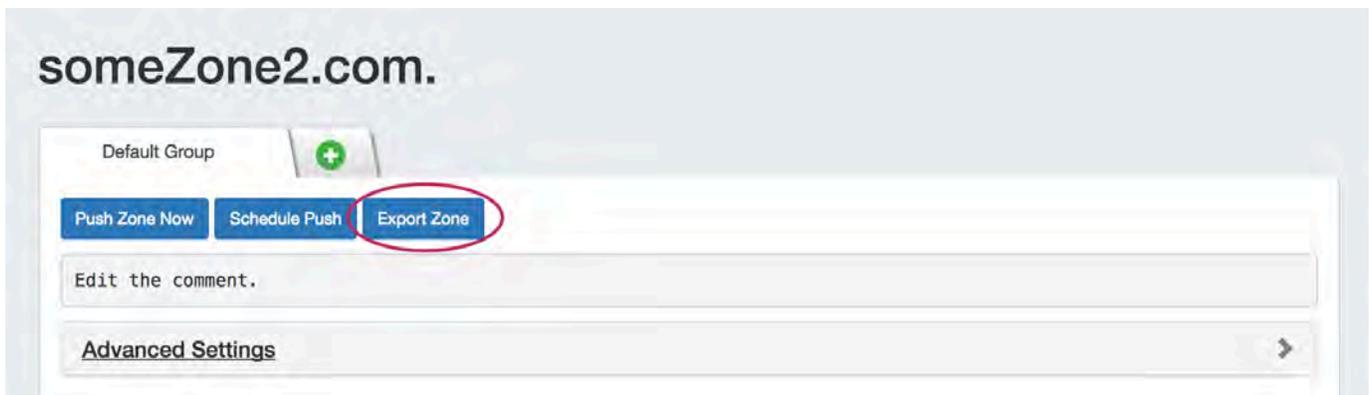

Admin users may push all zones on a server from the [DNS](#) Tab -> [DNS Servers](#) page.

For information on working with DNS Servers, including performing a manual or scheduled server push, see [Working with DNS Servers - Pushing a Server](#).

Export a Zone

Individual zones may be exported to a .zone file by clicking the "Export Zone" button on the View Zone page.

Individual .zone files may later be compressed into a .zip, and used with [ProVision's BIND DNS Zone Upload / Import tool](#).

Delete a Zone

Users with resource delete permissions over the zone may delete a zone record by clicking the "Delete" button under "Actions" for the desired zone entry in any Zone List.

Additional Information:

For more information on working with DNS Zones, Groups, and Servers, see the following sections:

Editing DNS Zones

Editing DNS Zones - The View Zone Page

Zones may be edited by clicking on the Zone name in any zone list in which it appears - zones listed under DNS Groups, under DNS Server attached zones list, or from the DNS Gadget.

Clicking on the zone name opens up the View Zone page, from where comments may be added, records added or updated, servers attached to the zone, advanced settings edited, backups restored or the zone pushed / exported.

Zone Backups

Backup Date
2017-06-05 12:42:27
2017-05-31 14:00:04

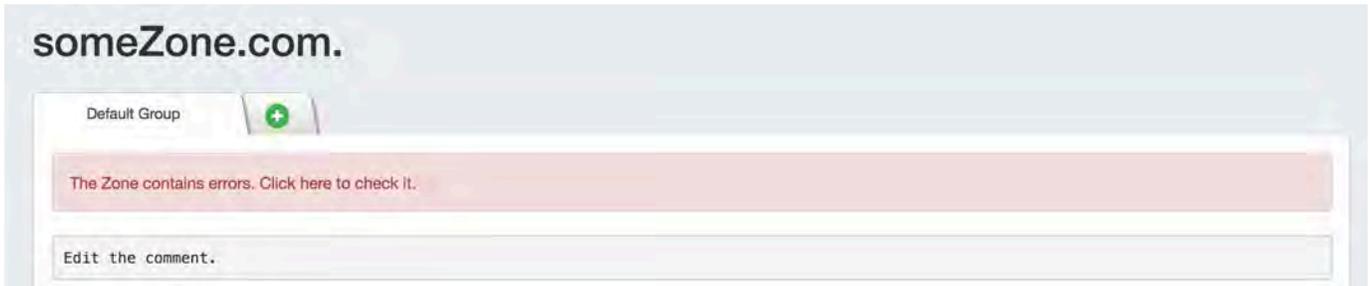

Areas of the Zone View page include:

- Editing DNS Zones - The View Zone Page
 - Error Notification
 - Zone Actions
 - Comments
 - Advanced Settings
 - DNS Records
 - Add a Record
 - Edit a Record
 - Delete a Record
 - Check a Record
 - Scheduled Tasks
 - Attached Servers
 - Zone Backups
- Additional Information:

Error Notification

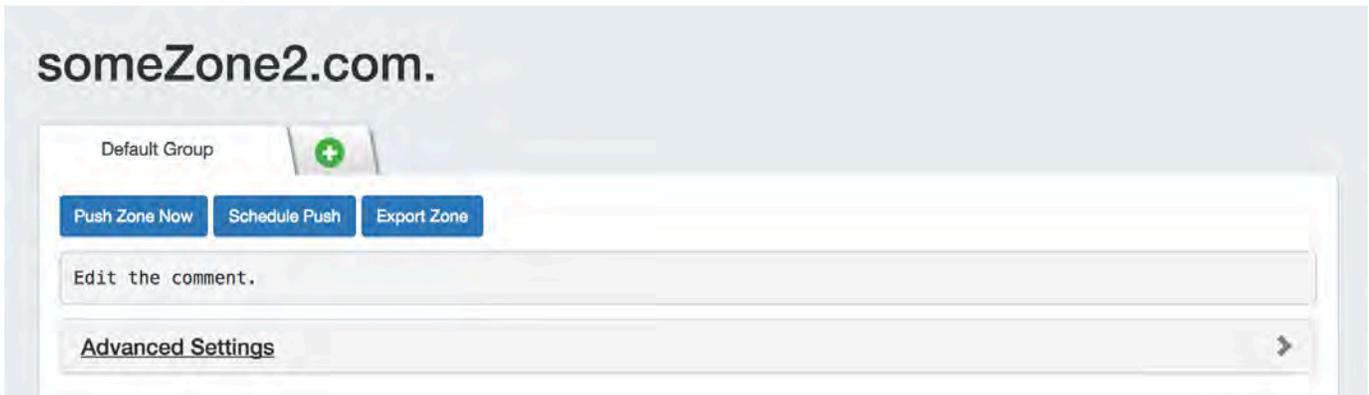

If errors are detected for the zone, an error notice will be given at the top of the group tab for the zone. To review the error, click on the message, and it will list the number of errors present, and details if available.

Records with errors will be highlighted in red in the records list.

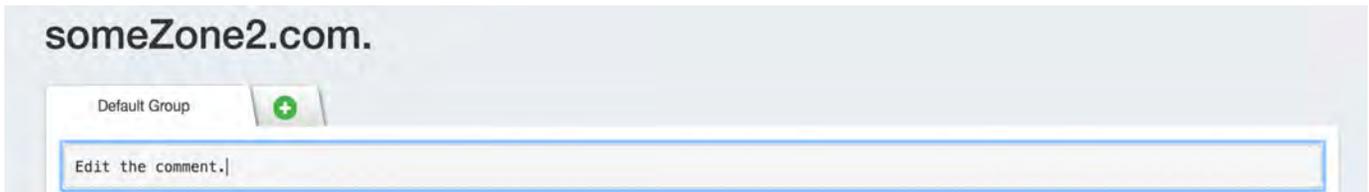

Zone Actions

Zone actions that may be taken include pushing the zone ("Push Zone Now"), scheduling a zone push ("Schedule Push") or exporting the zone to a .zone file ("Export Zone").

Comments

To add a comment to a zone, click anywhere inside the comment area and begin typing. The comment will be saved when an area outside of the comment box is clicked, deselecting the comment area.

Advanced Settings

Open the zone "Advanced Settings" section by clicking on the header or the expansion arrow (>).

Advanced Settings

Parent Resource: Default Group
The new zone resource will be a child of the Parent Resource.

Enable DNSSEC: OFF

Enable Dynamic Updates: OFF
This feature is using the dynamic update functionality of the DNS Server. Every record that you modify/remove/create will be updated on the servers automatically without pushing the zone.

Also-Notify List: ex. 192.168.3.0; 10.10.3.0/24
The list will be added to the also-notify list on the DNS servers that support this option.

Allow Update List: ex. 192.168.3.0; 10.10.3.0/24
The list will be added to the allow-update list on the DNS servers that support this option.

Allow Transfer List: ex. 192.168.3.0;
The list will be added to the allow-transfer list on the DNS servers that support this option. On exporting a zone to a master server, the slaves are automatically added !

Allow Notify List: ex. 10.1.0.15; 172.28.32.7;
The list will be added to the allow-notify list on the DNS servers that support this option. On exporting a zone to a slave server, the masters are automatically added !

Free Lines (Dangerous):
The content inside this field will be append to the zone section of the server configuration. Please be very careful with this field as it can cause configuration errors ! They are currently valid only for ISC Bind.

Save

Here, you will find options for:

Parent Resource: Sets the zone's Parent Resource, which affects the permissions access for the zone. By default, the parent is set as the DNS Group the zone is in.

Enable DNSSEC: Toggle "On" or "Off" to enabled DNSSEC for the zone, if supported by the attached server.

Enable Dynamic Updates: Toggle "On" or "Off" to enabled Dynamic Updates for the zone, if supported by the attached server.

Also-notify List: Add IPs to also-notify list of the attached DNS sever, if supported.

Allow Update List: Add IPs to the allow updates list of the attached DNS sever, if supported.

Allow Transfer List: Add IPs to the allow transfer list of the attached DNS sever, if supported. Slaves are automatically added if exporting a zone to a master server.

Allow Notify List: Add IPs to the allow notify list of the attached DNS sever, if supported.

Free Lines: Enter free lines to append to the zone section of the server configuration for the attached server (ISC BIND only). Use with caution - this can cause configuration errors if mistakenly included.

Save Button: Be sure to click "save" when edits are complete, or changes will not be saved.

DNS Records

The DNS Records list contains options to add a new record of the selected type, edit record information, delete a record, or check a record.

DNS Records

Add a New A Record Add

Record Type	Record Data	Actions
SOA	ns.example.com. hostmaster.example.com. (2017053100 172800 900 3600 900)	
NS	someZone2.com. maps to ns1.test.com.	Delete Check

Add a Record

From the View Zone page, under DNS Records, look for the line "Add a new ____ Record".

Select the desired record type, then click "Add".

DNS Records

Add a New A Record Add

Record Type	Record Data	Actions
SOA	ns.example.com. hostmaster.example.com. (2017053100 172800 900 3600 900)	
NS	someZone2.com. maps to ns1.test.com.	Delete Check

Fill out the record host, value, select TTL, add a comment (optional), and check "Add to All Views" or "Skip Validation" if desired.

Edit NS record

Type: NS

Host:

Value:

TTL:

Comment:

Add to all views.

Skip Validation.

Close

Save changes

When complete, click "Save changes".

Edit a Record

To edit an existing zone record, click on the record line in the DNS Records list.

The Edit Record dialog will open, allowing you to fill in record details.

Edit NS record

Type: NS

Host: someZone2.com.

Value: ns1.test.com.

TTL: 1 hour

Comment: You can add a comment to the record, that will not be pushed to the server.

Skip Validation.

Record revisions

Date	Host	Value
2017-05-31 14:00:04	someZone2.com.	ns1.test.com.
2017-05-31 13:19:13	someZone2.com.	ns1.test.com.

Close Save changes

Fill in the Host, Value, TTL, and comment if desired.

An option exists to "Skip Validation" - check to select if you wish to bypass validation for the record.

If previous versions of the record exist, the revision log will be visible under "Record revisions".

When edits or reviewing is complete, click "Save changes", or "Close" to exit without saving.

Delete a Record

Delete a zone record by clicking the "Delete" button under "Actions" for the desired record entry.

Check a Record

Check a record for errors by clicking the "Check" button under "Actions" for the desired record entry.

Scheduled Tasks

If scheduled tasks (zone pushes) have been set up for the zone, they will appear under a "Scheduled Tasks" section.

Tasks here will also show in the [Admin Scheduler](#) task list.

Scheduled Tasks

Task Name	Last Run	Repeat Time	Actions
Scheduled Push: someZone.com.		One time on 2017-06-02 at 11:05 PDT	Delete

The task may be deleted by clicking the "delete" button.

Attached Servers

Servers attached directly to the zone, or inherited from the zone's parent DNS Group will be shown here.

Additional servers may be attached by selecting the server name, type (default, master, slave), and clicking the "Attach" button, as long as the user has permissions on both the zone and the server to attach.

Server Name	Server Backend	Server Type	Server Status	Actions
Servers inherited from "Default Group"				
6c BIND QA Server	ISCBIND	master		

Attach server:

To detach a server from a zone, look for the server under the "Attached Servers" list, then click "Detach" under actions for that server.

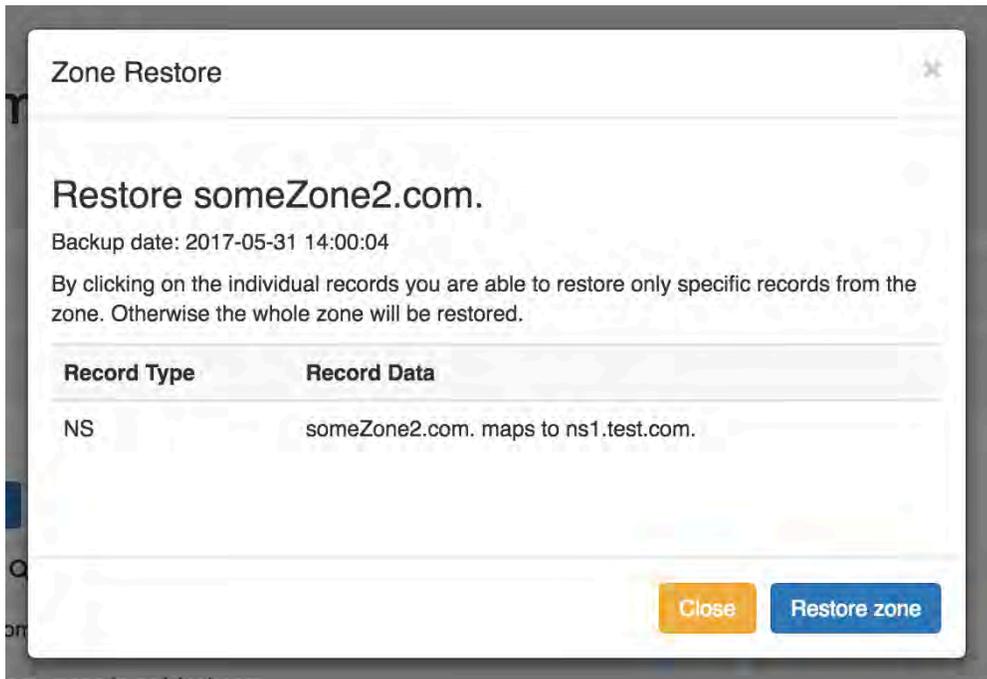

Zone Backups

If a zone has had changes successfully pushed, a "Zone Backups" section appears near the bottom of the page, showing the date and time of the backup.

Zone Backups

Backup Date
2017-05-31 14:00:04
2017-05-31 13:19:13

To view details, or restore the zone to the previous version, click on the row of the desired date/time backup, and the "Zone Restore" module will open.

From here, you may restore individual records by clicking on them, or restore the entire zone by clicking the "Restore Zone" button.

To exit without saving, click the "Close" button.

Additional Information:

 - Create a New DHCP Pool - Host
 - Current Pushed Configuration
 - Saving/Pushing DHCP Server Configurations
- Working with the DHCP Customer Configuration Gadget
 - Setting up the DHCP Customer Configuration Gadget
 - Using the DHCP Customer Configuration Gadget
- Permissions
 - Additional Information

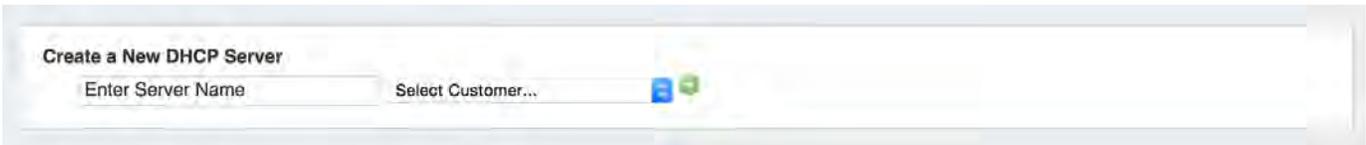

Adding DHCP Servers

To add a DHCP Server to ProVision from the **DHCP** Tab, click on the "Add a DHCP Server" link. The create server dialog area will open.

Type the server name, then under "Select Customer", choose the resource to which the DHCP server belongs. This creates a hierarchical relationship, with the server as a child resource under the selected parent.

When you are done providing this information, click on the green "+" icon to add the server.

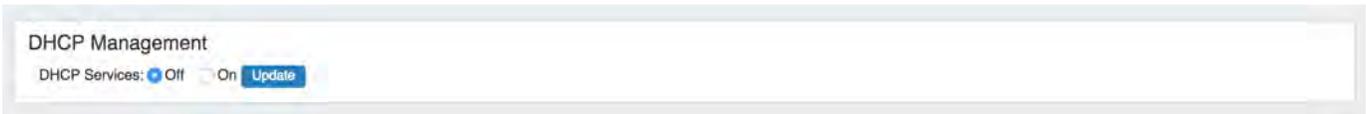

Working with the DHCP Gadget

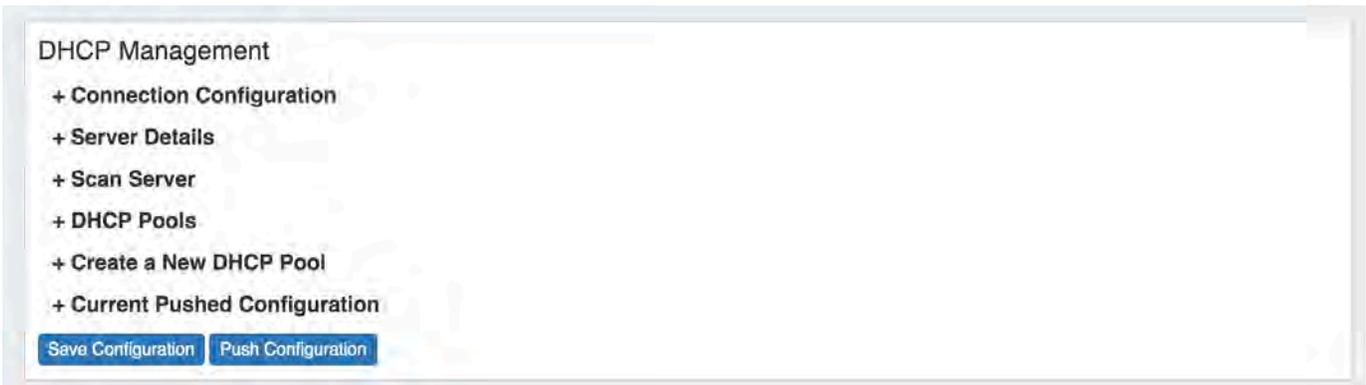

Before You Begin:

Attach / Enable the DHCP Gadget

Verify that the [DHCP Gadget](#) is attached to the Resource Section. Then, you can enable the gadget by selecting the radio button next to "On", and click "Update".

Once enabled, the DHCP Management Gadget will show sections for Connection Configuration, Server Details, Scan Server, DHCP Pools, Create a New DHCP Pool, and Current Pushed Configuration.

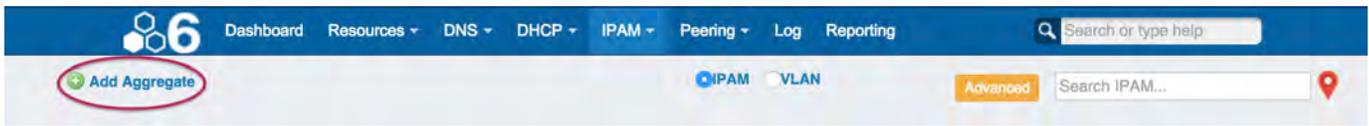

These sections will be reviewed in detail further on in this section.

Defining DHCP Scopes - Create DHCP Aggregates

In order to use DHCP functions and add DHCP Pools, the IP blocks need to be defined in the [IPAM](#) section to create a DHCP specific aggregate.

Under the [IPAM](#) tab, select "Add Aggregate". It will open the Add Aggregate dialog.

Fill in the aggregate information, and select the "DHCP Aggregate" checkbox option as outlined below. "Allow Sub-Assignment" will be selected automatically, so that smaller blocks may be assigned to DHCP pools.

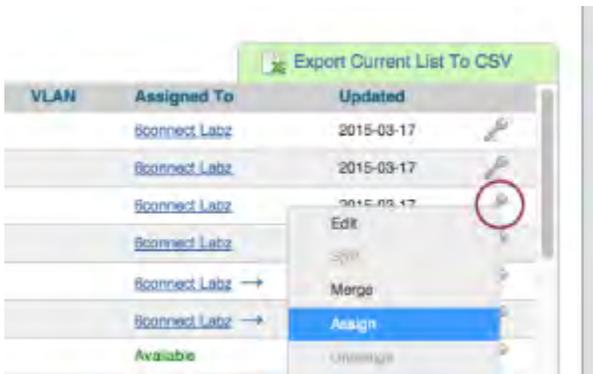

This will ensure the block is automatically added to the DHCP Available Resource, and thus usable when building DHCP Server Configurations and defining DHCP Pools.

When done, click "Add Aggregate"

Using an Existing Aggregate

If you would like to use an existing aggregate or part of an existing aggregate, you simply need to "assign" the block to the Resource Holder "DHCP Available".

1) From the IPAM Manage screen, click on the Action Menu, then select "Assign".

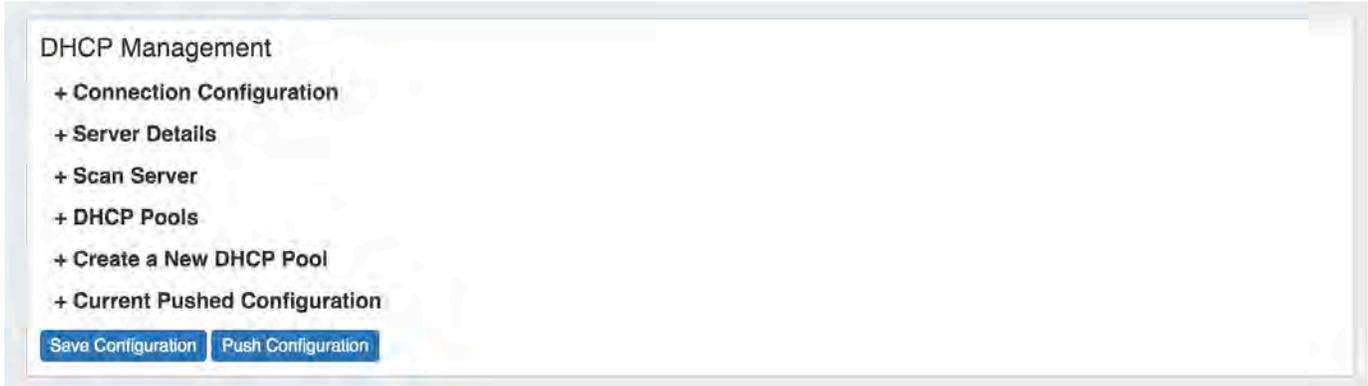

2) In the Assign Block dialog, scroll until you find "DHCP Available". Select it, then click on "Assign Block".

Once the IP block is assigned to DHCP Available, it will be available to assign to a DHCP Pool via the DHCP Gadget.

Managing DHCP Server Configurations

Once DHCP functions are enabled for a Resource Section, you will be able to manage configurations per Resource by expanding the relevant areas on the Resource's Entry page.

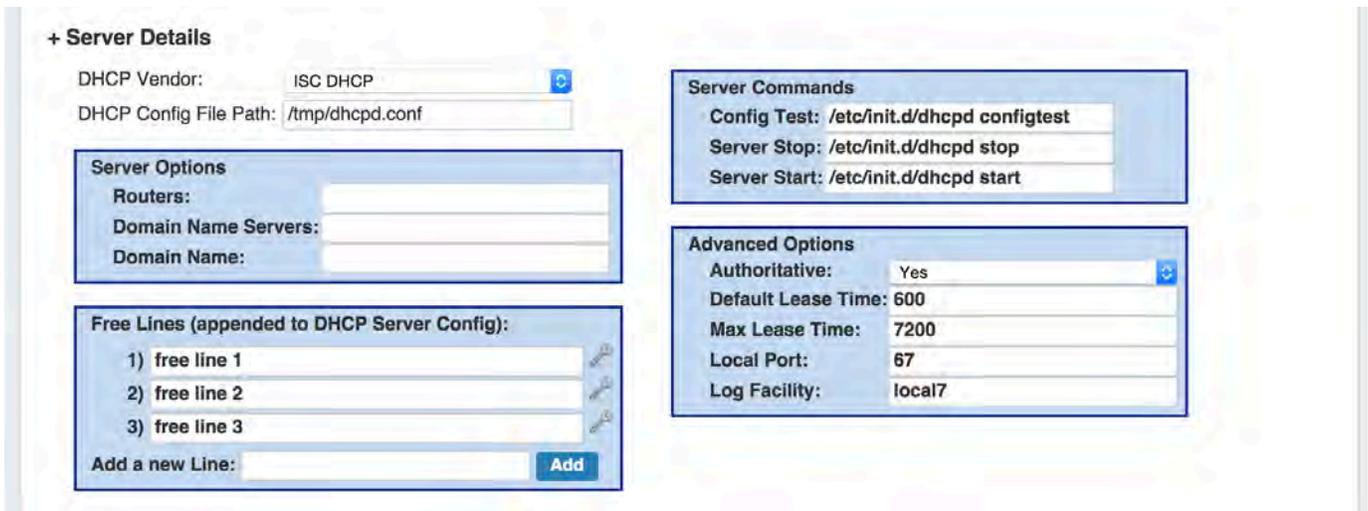

Connection Configuration

In this gadget area, you may enter in the information that will be used for ProVision to communicate to the DHCP Server.

Server Details

Server details and advanced options may be entered under this portion of the gadget.

Server Command: Config Test

A note on the Server Command: Config Test option:

This command is run after the newly-written DHCP Config file has been transferred to the server but before the server is restarted. Due

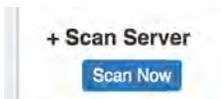

to the wide variety of DHCP install configurations that can arise on different systems, it is best if the Config Test option is as explicit as possible. For example:

```
sudo /usr/sbin/dhcpd -t -cf /etc/dhcp/dhcpd.conf
```

This command explicitly requests the DHCP daemon start in test-only mode (-t) with a specific config file (-cf). This config file should be the location supplied in the "DHCP Config File Path" section.

Scan Server

Scan Server provides a "Scan Now" button, which scans the DHCP server and returns found IPs under DHCP Pools.

The returned IPs are divided by Pools and IPv4/IPv6. Returned fields include MAC address, IP address, and name. The percentage utilization of IP space out of the available DHCP Pool space is also included at the top of the list.

Scan Results
 Blah: 0 Hosts Found. 256 Hosts Available. 100.00% Free
 No Hosts Found

Miscellaneous Addresses: found addresses which do not match a linked DHCP Pool

Unknown Host	88:1fa1:2a:d7:71		2607:fae0:6000::5065

If the scan is unable to be completed, an error message will appear in the DHCP Management section.

DHCP Pools

In this area, the admin can specify what DHCP Pools are linked to the DHCP server. This includes any host reservations as well as DHCP Pools as defined in the next section.

Use the Action menu to Link to Server, Delete, or Remove Link from Pools.

Additional edits may be made to pools by clicking on the Pool name. This allows the Pool name, assignment, and lines to be changed. Be sure to hit "Save" after making changes.

DHCP Pool Search:

Both Linked and Existing DHCP pools have field-specific search options to filter the DHCP pool list(s). Select the search term type from the dropdown list, type the search term in the search box, then hit "Search".

For both Linked and Existing pools, search terms include:

Name: The full or partial name of the pool (ex: "Lab")

MAC: The full (ex: 00:11:22:33:44:55:66:77) or partial (:22) MAC address, for pools that were created as "Host" type. MAC address searches must include a colon.

IP: Search by IP Block by providing the CIDR assigned to the pool. (ex: 10.0.0.0/24)

For Existing Pools, additional filter terms may be included to further filter the IP search by Region or assigned Resource.

After entering your search terms, click "Search", and the pool list will filter to the results.

Create a New DHCP Pool - Subnets

When Assigning a Subnet (via dropdown) the IP Assignment selection will pull the data from the DHCP Available blocks that you defined earlier. You can use either a Smart or Direct assignment depending on your preference. For Smart Assign pool creation, existing IP Rules may be applied to reserve additional addresses out of the pool range. To create an IP Rule, see [IPAM Rules](#).

DHCP Pools and IP Rules

For DHCP Pools, ProVision automatically reserves the first and last address of the pool for Gateway and Broadcast addresses, respectively.

If an additional IP Rule is applied, the rule will begin with the second address in the block.

For example: if a DHCP Pool is created using 10.0.0.64/29 with an IP Rule of "Reserve First Three", the resulting pool range would be 10.0.0.68 through 10.0.0.70, as the first four as well as the final address would be reserved.

Enter the name of the Pool / Subnet, and select the assignment criteria:

For **Smart Assign**: select IPv4 / IPv6, Mask, then optional Region, Resource assignment, Domain - VLAN, and IP Rules criteria, add free lines if desired, then click "Add Pool".

The screenshot shows the 'Create a New DHCP Pool' form. At the top, there is a dropdown menu labeled 'Create a new Subnet'. Below it is a text input field for 'Subnet Name' with a placeholder '(ex: Lab #1)'. The 'New IP Assignment' section includes dropdowns for 'Smart', 'IPv4', 'Mask', and 'Region', followed by a 'Select a Resource' dropdown. There are also dropdowns for 'Domain' and 'Apply an IPAM Rule'. A checkbox for 'Assign default gateway' is present. The 'Free Lines' section shows 'No lines saved.' and an 'Add a New Line' input with an 'Add' button. The 'Add Pool' button is circled in red.

For **Direct Assign**: select IPv4 / IPv6 and enter the block in CIDR format, add free lines if desired, then click "Add Pool".

The screenshot shows the 'Create a New DHCP Pool' form. At the top, there is a dropdown menu labeled 'Create a new Subnet'. Below it is a text input field for 'Subnet Name' with a placeholder '(ex: Lab #1)'. The 'New IP Assignment' section includes dropdowns for 'Direct' and 'IPv4', followed by a text input field for the CIDR block 'x.x.x.x/yy'. The 'Free Lines' section shows 'No lines saved.' and an 'Add a New Line' input with an 'Add' button. The 'Add Pool' button is circled in red. At the bottom, there are 'Save Configuration' and 'Push Configuration' buttons.

Create a New DHCP Pool - Host

When reserving Hostname/MAC data, change the Dropdown to "Host". This will also give you an option to assign from an existing DHCP block (smart assign) or a specific IP address (direct assign).

Enter the name of the Hostname and MAC address, then select the assignment criteria:

For **Smart Assign**: select IPv4 / IPv6, then optional Region, Resource assignment, Domain - VLAN, and IP Rule criteria, add free lines if desired, then click "Add Pool".

Save Configuration **Push Configuration**

Current Pushed Configuration

Expanding "Current Pushed Configuration" allows you to view the detailed text (read-only) of the last successfully pushed configuration.

Current Pushed Configuration does not reflect any un-pushed changes or failed pushes.

+ Current Pushed Configuration

This is the last successfully pushed configuration. It does not reflect unpushed changes or failed pushes.

```
# DHCP Config for ISC.

authoritative;
option domain-name-servers dev2.6connect.com;
default-lease-time 600;
max-lease-time 7200;
local-port 67;
log-facility local7;

subnet 10.8.0.0 netmask 255.255.255.0 {
    range 10.8.0.0 10.8.0.255;
}

subnet 10.8.1.0 netmask 255.255.255.252 {
    range 10.8.1.0 10.8.1.3;
}
```

Save Configuration **Push Configuration**

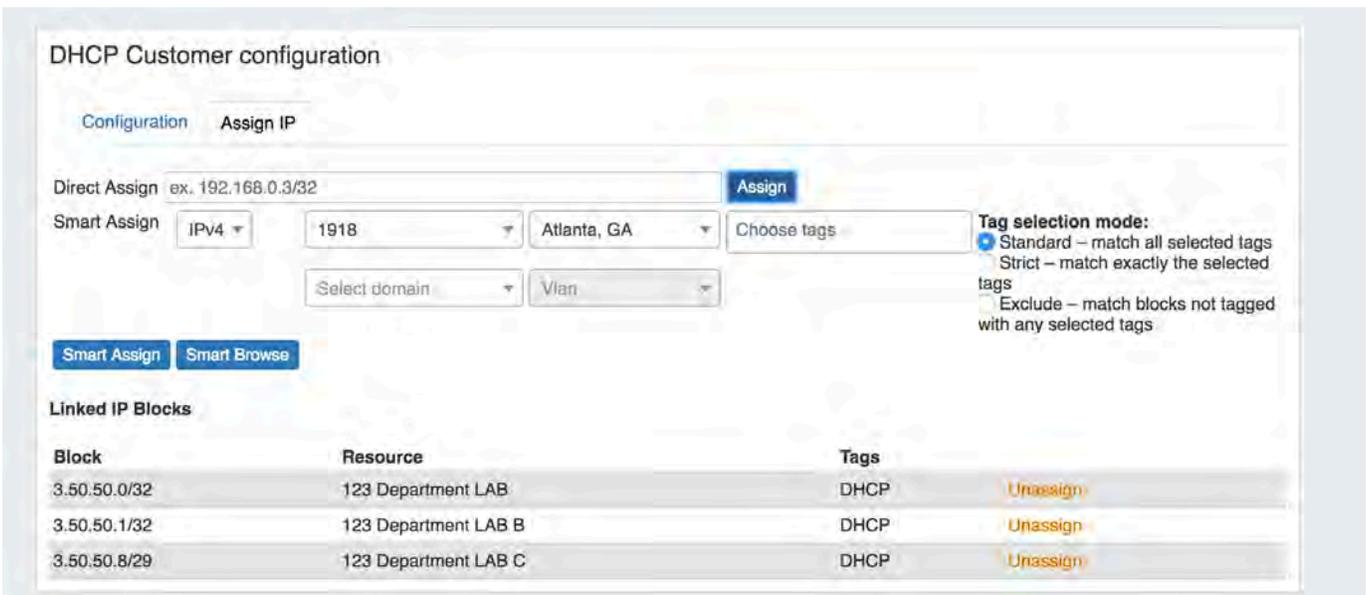

Saving/Pushing DHCP Server Configurations

It is recommended that you save your configuration after changes. Save your changes by clicking the "Save Configuration" button at the bottom of the DHCP Management Gadget.

When you Push a Configuration (by clicking "Push Configuration") the configuration is automatically saved.

Working with the DHCP Customer Configuration Gadget

A screenshot of the "DHCP Customer configuration" interface. It features two tabs: "Configuration" and "Assign IP". Under "Configuration", there are input fields for "Direct Assign" (with an example "ex. 192.168.0.3/32") and "Smart Assign". The "Smart Assign" section includes dropdowns for "IPv4", "1918", "Atlanta, GA", "Choose tags", "Select domain", and "Vlan". There are "Smart Assign" and "Smart Browse" buttons. A "Tag selection mode" section on the right has radio buttons for "Standard" (selected), "Strict", and "Exclude". Below this is a table titled "Linked IP Blocks" with columns for "Block", "Resource", and "Tags".

Block	Resource	Tags
3.50.50.0/32	123 Department LAB	DHCP Unassign
3.50.50.1/32	123 Department LAB B	DHCP Unassign
3.50.50.8/29	123 Department LAB C	DHCP Unassign

The DHCP Customer Configuration Gadget allows users to assign IP aggregates to the DHCP server pools and generate DHCP Server Configuration changes.

These configurations are then sent to the associated DHCP server Management Gadget as "Unpushed Configurations", where they may be held until a manual or schedule push occurs.

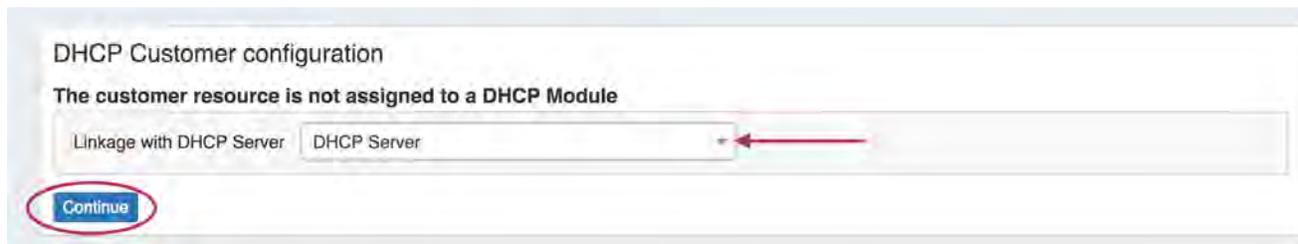

Setting up the DHCP Customer Configuration Gadget

Before using the DHCP Customer Configuration Gadget, the following should be set up in ProVision:

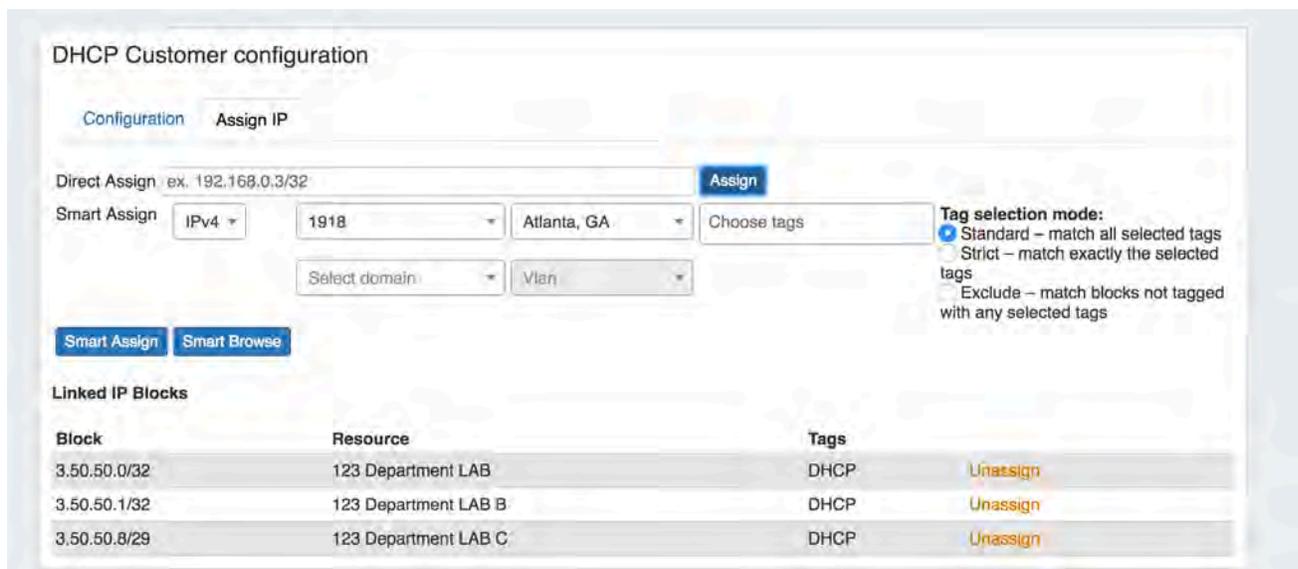

- The associated DHCP server should be created in ProVision and set up in the DHCP Management Gadget (See: [DHCP Tab](#)).
- Add the DHCP Customer Configuration Gadget to the desired Section. You may want to create a specific "DHCP Customer" Section for DHCP customer entries (See: [Customizing Sections](#)).
- Have, or set up DHCP Aggregates from the [IPAM](#) Tab with the desired IP space type, RIR, Region(s), Tags, and any desired VLAN criteria. Regions are a required field when assigning IPs from the DHCP Customer Configuration Gadget.

Using the DHCP Customer Configuration Gadget

Step 1) Link the Gadget with the desired DHCP Server

Step 2) Assign IP's for Pools from DHCP Aggregates

Step 3) Set up configuration information - add Option 82 Elements, Circuit ID, and notes. Use the "Preview" field to confirm the accuracy of the data, and select the status as "Activate" or "Terminate".
Once saved, the updated configuration will be sent to the DHCP Management Gadget.

}
```

Status:

Notes:

Step 4) an admin user may manually push the updated configuration from the DHCP Management Gadget, or use a [scheduled DHCP push task](#) to automate the pushes.

See [Gadgets - DHCP Customer Configuration](#) for more details.

Permissions

DHCP Management integrates with ProVision's resource and permissions hierarchy, as well as the IP Management system. Individual DHCP servers can be assigned via [Resource Permissions](#) to different internal user groups, to be managed by only the appropriate parties.

Additional Information

For more detail on advanced DHCP topics and the DHCP API, see [API Module - DHCP](#).

IPAM Tab

IPAM

The screenshot shows the IPAM dashboard interface. At the top, there is a navigation bar with tabs for Dashboard, Resources, DNS, DHCP, IPAM, Peering, Log, and Reporting. A search bar is located on the right. Below the navigation bar, there is a section for 'Aggregate Blocks' with a list of IP ranges. A map of the United States is displayed, showing various locations marked with dots. Below the map, there is a section for '1.0.10.0/24 - 1918' with a utilization chart and a table of resources and recent assignments.

Utilization	Resources	Recent Assignments
Available 0.00%	123 Department LAB	100.00%
Assigned 0.00%		No assignments
Allocated 100.00%		
Holding 0.00%		

The IPAM tab provides a listing of aggregate blocks and tools to add and manage aggregates.

- IPAM
 - UI Overview:
 - Add Aggregate:
 - "Advanced" Button:
 - Map View:
 - Aggregate Blocks List:
 - Top Level Aggregate Box:
 - Working with IP Blocks
 - Additional Information

UI Overview:

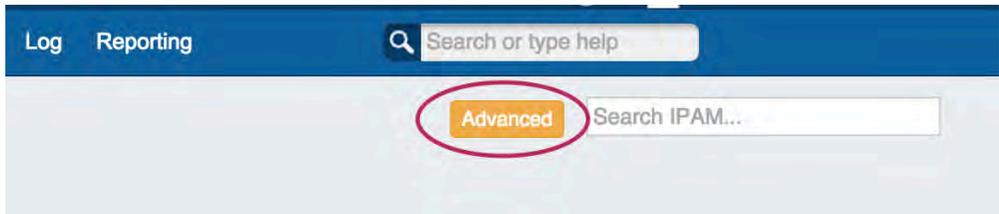

Add Aggregate:

Opens a menu to add an aggregate block with options for RIR, VLAN, Tags, Region, Resource, and enabling Sub-Assignments / DHCP Aggregate.

The screenshot shows the 'Add Aggregate' form. It includes fields for Subnet (with a placeholder 'x.x.x./yy OR xxx:xxx:xxx:xxx:'), RIR (with a dropdown menu), VLAN, Tags, Region (with a dropdown menu), and Resource (with a dropdown menu). There are also checkboxes for 'DHCP Aggregate' and 'Allow Sub-Assignment'. An 'Add Aggregate' button is located at the bottom left.

"Advanced" Button:

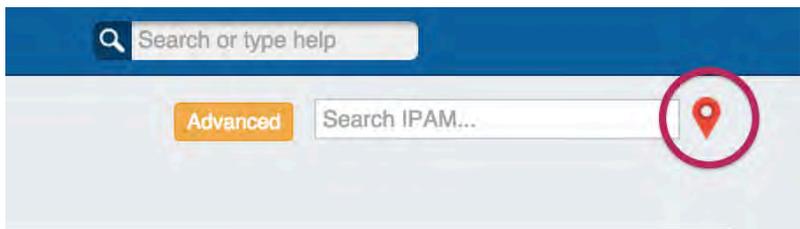

Opens the IPAM Manage screen for all blocks. See [Working with IP Blocks - Architecting IP Address Blocks](#) for more information on working in IPAM Manage.

Map View:

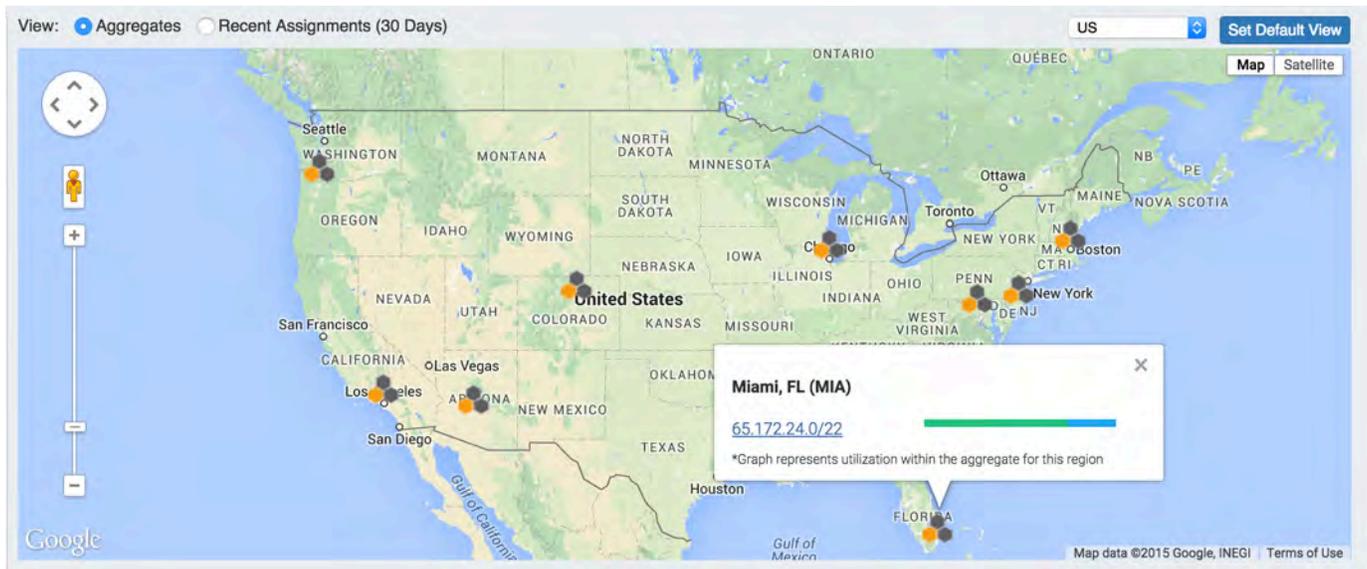

The IPAM aggregate map view may be enabled / disabled from the IPAM Configuration page. Once enabled, a map pin will be visible on the IPAM Tab next to the search box.

Click on the pin to show / hide the map.

Map View Overview:

Map View will show aggregate locations / recent assignments in geographical format, based on regions assigned to those aggregates. Clicking on a location icon will bring up a current utilization graph and a link to that aggregate's IPAM Manage page if in Aggregates view, or assignment details if in Recent Assignments view. A default map view may be set by either selecting a predefined map area from the dropdown (US, US & Europe, South America, All), and clicking on "Set Default View", or a custom area set by zooming / navigating to the desired map area and clicking "Set Default View".

View: Select "Aggregates" to view all available aggregates with region data, or "Recent Assignments" made within the past 30 days.

View Range Dropdown: Select a predefined area for the map view range: US, US & Europe, South America, or All.

Set Default View: Click to save the current map view range as the default view.

Aggregate Detail Box: Provides utilization data and a shortcut link to the IPAM Manage screen for that aggregate if in "Aggregates" view, or assignment details if in "Recent Assignments" view.

Regions must be enabled, the region address field populated, and regions assigned to aggregates / blocks for the IPAM Map view to

populate data. See [Edit Regions](#) for additional detail.

Aggregate Blocks List:

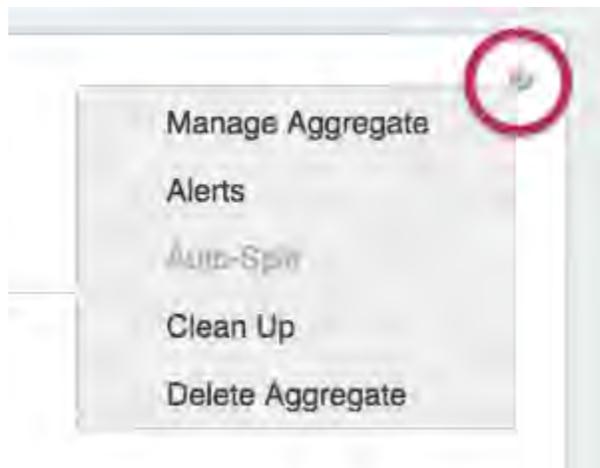

Provides a searchable listing of all aggregate blocks in the left sidebar. Selecting "All / IPv4 / IPv6 / DHCP" will filter the visible aggregates in the center of the page.

Top Level Aggregate Box:

Provides detailed information on that aggregate, including percentage breakdowns, the top five Resources assigned under that aggregate, and recent assignments.

Top Level Aggregate Action Menu (wrench icon):

"Manage Aggregate" opens the IPAM Manage screen for blocks under that aggregate. See [Working with IP Blocks - Architecting IP Address Blocks](#) for more information on working in IPAM Manage.

"Alerts" opens the "Manage Alerts" dialog, where you can set up an email alert to send when available space reaches less than a certain percentage. An IPAM Alert task must be set up in the [Scheduler](#) detailing the alert schedule for the alert to send.

"Auto-Split" opens the template to split the aggregate into specific sized blocks.

"Clean Up" opens the template to merge the aggregate into specific sized blocks.

"Delete Aggregate" The provides the option to delete the aggregate.

Are you sure you want to delete this aggregate?

All data and assignments for 10.4.0.0/24 and any of its child blocks will be deleted.

Delete

Cancel

Working with IP Blocks

For additional information on performing IPAM tasks and working with blocks, see the following sections:

Additional Information

Working with IP Blocks

Working with IP Blocks

- Working with IP Blocks
 - Adding/Deleting IP Address Aggregates
 - Set Aggregate Alerts
 - Architecting IP Address Blocks
 - Splitting/Merging blocks manually
 - Splitting/Aggregating blocks with Templates
 - IP Block parameters and Editing Attributes
 - Edit Attributes Overview:
 - Assigning IP Space
 - Assigning Space from the IPAM Gadget
 - Direct Assign
 - Smart Browse
 - Smart Assign
 - Manually Assigning Space from the IPAM Manager
 - Sub Assigning IP Space
 - Unassigning IP Space
 - View Parent Blocks in IPAM Manage

Adding/Deleting IP Address Aggregates

On the standard IPAM page there is an option to "Add Aggregate". Click on the green "Add" icon.

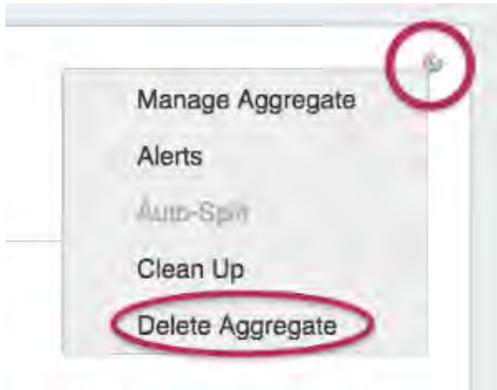

Once clicked, you get a more detailed screen to add an aggregate block.

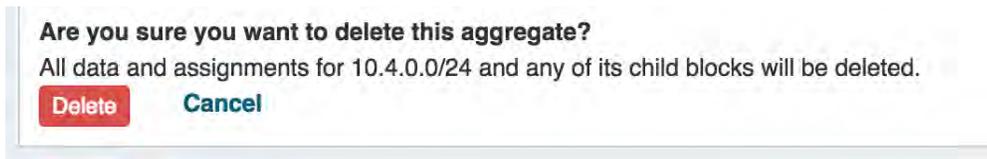

When a block is added, you will be able to see it on the IPAM page.

To delete the aggregate - click on the Action Menu (wrench icon) for the aggregate in the top right corner of the box, and you will have the option delete the aggregate.

After selecting the "Delete Aggregate", a message will show up in the aggregate box verifying that you would like to delete. Deleting will remove all data and existing assignments from the aggregate and its child blocks. If certain you want to delete, click the "Delete" button. Otherwise, select "Cancel".

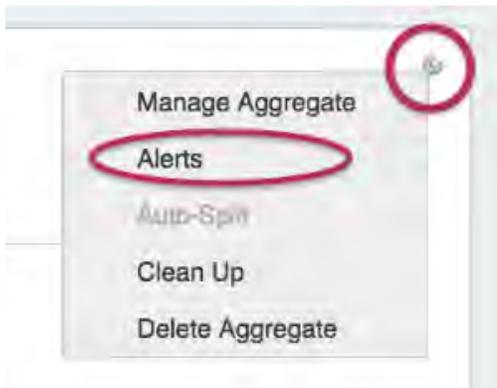

Set Aggregate Alerts

Aggregate alerts allows you to set up an email notification to send once an aggregate's available space hits a chosen percentage threshold.

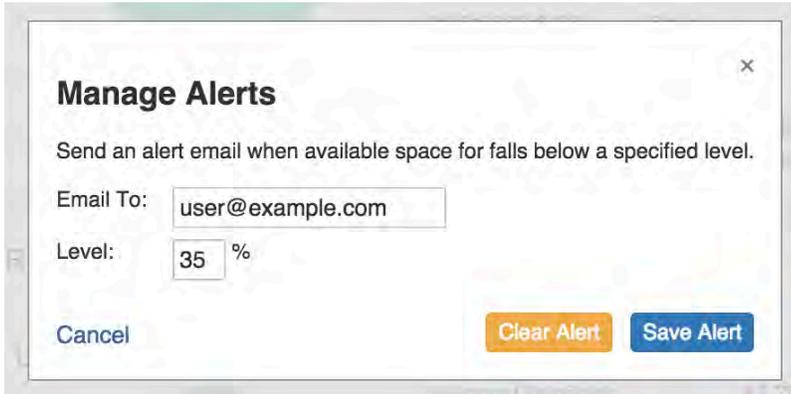

Prior to setting the alert, verify that an IPAM Alerts task has been created in the [Scheduler](#), detailing the alert schedule / frequency. Alerts will not send unless the scheduled task has been created to set the desired alert frequency.

To set the alert, select the Action Menu (wrench icon) for an aggregate, and click on "Alerts".

This brings up the "Manage Alerts" dialog. Enter the email address for the alert recipient and the available space percentage at which the alert is triggered.

When done, hit "Save Alert". You may also cancel at any time.

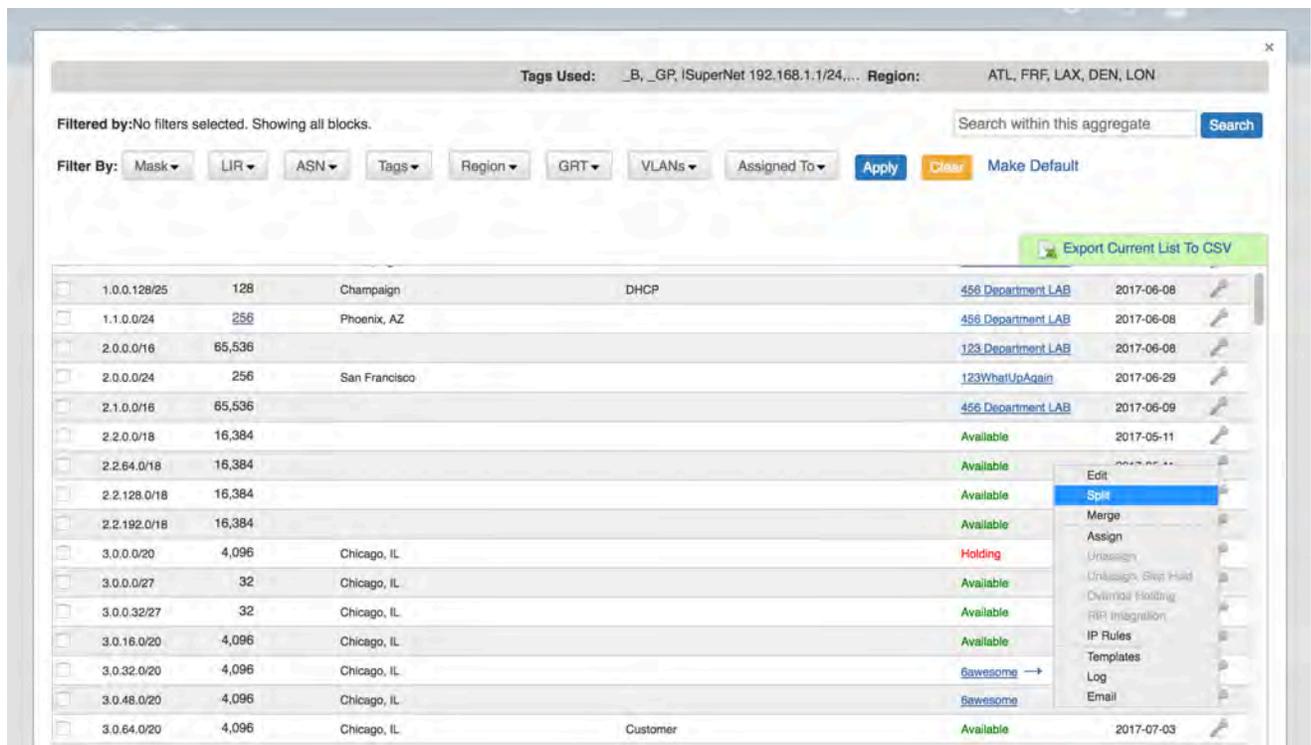

To clear an existing alert, hit "Clear Alert", and the alert information will be removed and status saved.

Architecting IP Address Blocks

Splitting/Merging blocks manually

To split a block manually - While in the IPAM Mangle screen, click on the Action Menu (wrench icon) for the available block you wish to modify.

Then select the "Split" function. To aggregate blocks, select "Merge" from the same menu.

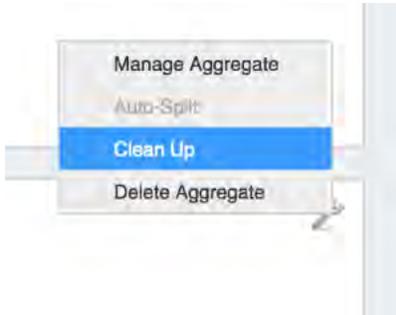

Splitting/Aggregating blocks with Templates

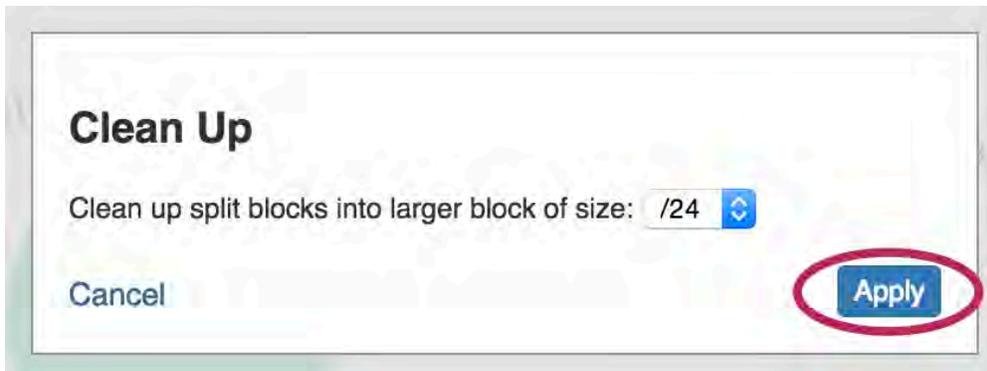

Templates for a block are available under the Action Menu (wrench icon) for that block. There are two templates available: Cleanup, which auto-aggregates the block, and Auto-split.

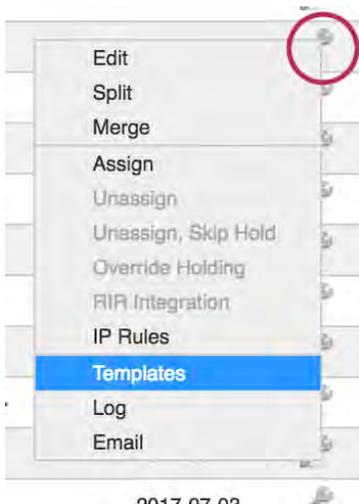

Select the desired template from the action menu.

Select the Split / Clean Up size desired, and hit "Apply".

You can also use the "Templates" option from the Action Menu on the IPAM Manage screen for the specific block.

Then, select the auto split parameters from there, and hit "Apply Template".

IP Block parameters and Editing Attributes

When you have your IP blocks laid out, you can then modify their attributes, split them further, assign them, etc. Select the "Edit" option from the Action Menu for a given block to get the Edit Attributes menu.

From here you can set a variety of attributes for a given block. These values are also customizable from the Admin screen - [IPAM Admin](#). For more information on IPAM management, see [IPAM Administration](#) and [IPAM Parameters](#).

Edit Attributes Overview:

Allow Subassignments: When editing a block that has been assigned, checking this box allows for further subassignments, indicated by a blue arrow next to the assignment in the Manage screen. Note: Subassign status cannot be changed if a block has children.

RIR / LIR / Region: Select the information from the drop down menus. LIR and Regions can be customized in the IPAM Admin section of ProVision - see [IPAM Administration](#) and [IPAM Parameters](#).

Generic Code: This is a customizable text field that can be used to track information specific to your needs. It can be filtered in the IPAM Manage screen. The header, display, and enabling settings for this field are set under IPAM Configuration in the [IPAM Administration](#) section.

Domain: The VLAN Domain to associate with the block.

VLAN: VLAN information for the block, must have domain selected to view available VLANs.

ASN: ASN information for the block.

Notes: Freeform text field for additional information you wish to capture.

Tags: Tags can be set under Edit Tags in the [IPAM Administration](#) section.

Propagate Attributes to Children: Select this box when editing a parent block to carry through attribute changes to all children of that block. To view parent blocks, simply ensure that top level or all masks are selected in the Filter menu in the IPAM Manage screen.

Note: The VLAN of a child cannot be different from that of its parent, so for multi-level situations (Parent -> Child -> Grandchild), VLAN should be updated at the top tier parent level.

After editing the desired attributes for the block, simply hit "Save".

Assigning IP Space

There are two areas where you can assign IP Space: in the IPAM Gadget for the particular Resource, or through IPAM Manage for manually assigning a block to a resource. The IPAM Gadget allows for more detailed assignment options including Direct Assign, Smart Browse, and Smart Assign with advanced options, and is the primary tool for space assignment.

Assigning Space from the IPAM Gadget

The IPAM Gadget is accessed from a Resource Entry page, once enabled for the Section (to add Gadgets, see [Customizing Sections and Add Gadgets to your Section](#)).

Address	Hosts	LIR	Region	Notes	Tags	Assigned	Updated
1.0.20.48/28	16					2015-01-28	2015-01-28
10.0.0.0/31 →	2		Quito	Por tickete 102233	Anycast,BB	2014-12-19	2014-12-19
10.0.0.2/31 →	2		Quito	Por tickete 102233	Anycast,BB	2014-12-19	2014-12-19
10.0.0.8/29	8				Anycast,BB	2014-12-05	2014-12-05
10.0.0.16/28	16				Anycast,BB	2014-12-05	2014-12-05
10.17.4.0/32	1		Vancouver		Dev,Infrastructure	2015-05-20	2015-05-20
10.128.0.0/32	1		Vancouver			2015-05-20	2015-05-20

You have three options for assigning IP space using the IPAM Gadget:

Direct Assign

This field allows you to manually enter an IP block to assign. Enter an IPv4 or IPv6 block, and then click "Assign".

Note

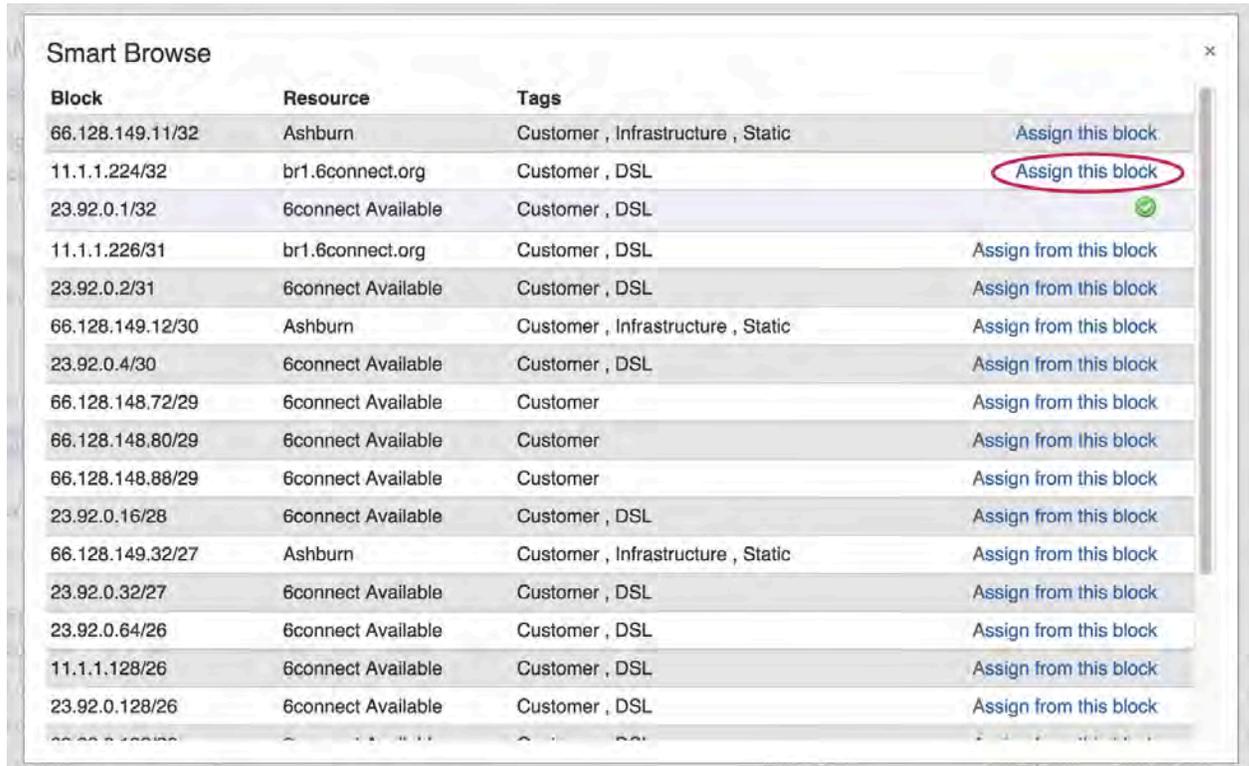

The default maximum function nesting level is '100'. If you experience issues resulting from recursion limits and require a different maximum, the local admin can increase the recursion limit setting in php.ini. Refer to http://xdebug.org/docs/all_settings#max_nesting_level.

Smart Browse

Smart Browse utilizes the smart assign parameters as search filter criteria. Under the "Smart Assign" area, select the IPv4/IPv6, Size, RIR, Region, and/or Tags that you wish to filter the available blocks list.

Click on "Smart Browse" to bring up a list of IP aggregates meeting that criteria, which you can select the block(s) to assign. A green check will show next to the block once assigned. You may assign multiple blocks per browse session.

Smart Assign

This series of dropdowns allows you to specify the parameters for the type of IP block you want to assign, as well as tag selection modes. Then it will look at the IPAM blocks that match your criteria to find the correct IP assignment based on availability and relevant parameters.

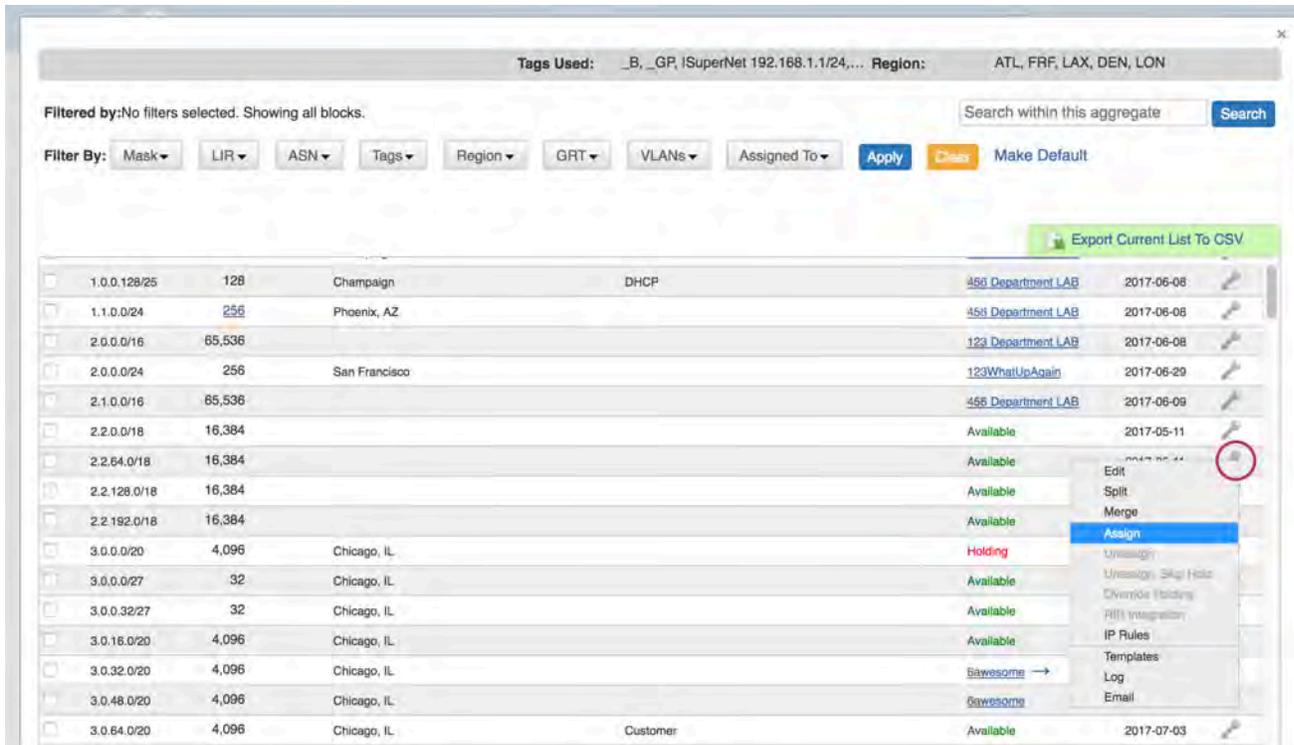

Additional advanced Smart Assign options are available under "Advanced Options", including VLAN and LIR.

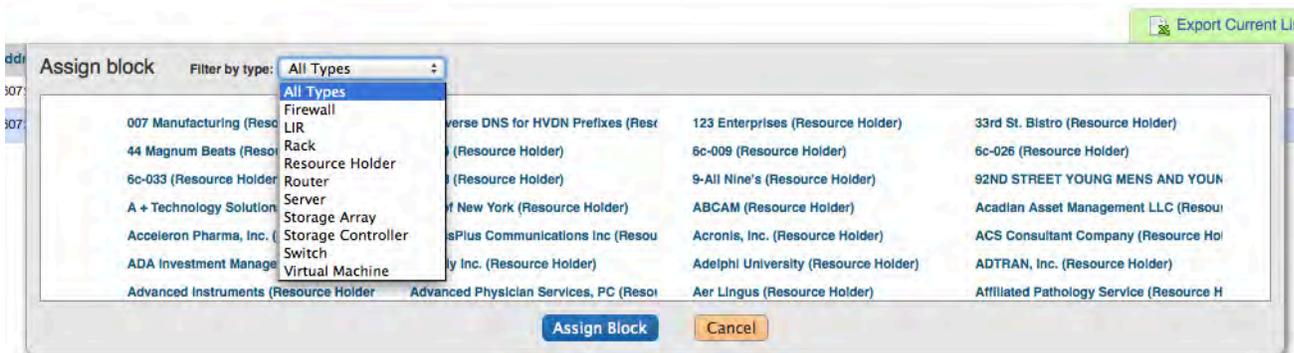

Once your criteria has been set, click the "Smart Assign" button.

Manually Assigning Space from the IPAM Manager

You can also assign blocks manually using the "Assign" function from the IPAM Manager screen (accessible from the IPAM Tab). Click the Action Menu (wrench icon), then select "Assign".

Then, select the Resource to assign the block. A filter tool is provided to narrow the list to a particular Section type.

After assigning, you can further edit the block attributes or subassign space.

'Reserving' IP Space
 If you need to create a 'reserved' pool from which to assign blocks, you can achieve this by creating a "Reserved" Section. Create a Section called "Reserved", add the IPAM gadget to it, then create an Entry with that Section to be the address group. From there, use the IPAM gadget and the IPAM Manage page to assign and unassign IP space from that pool.

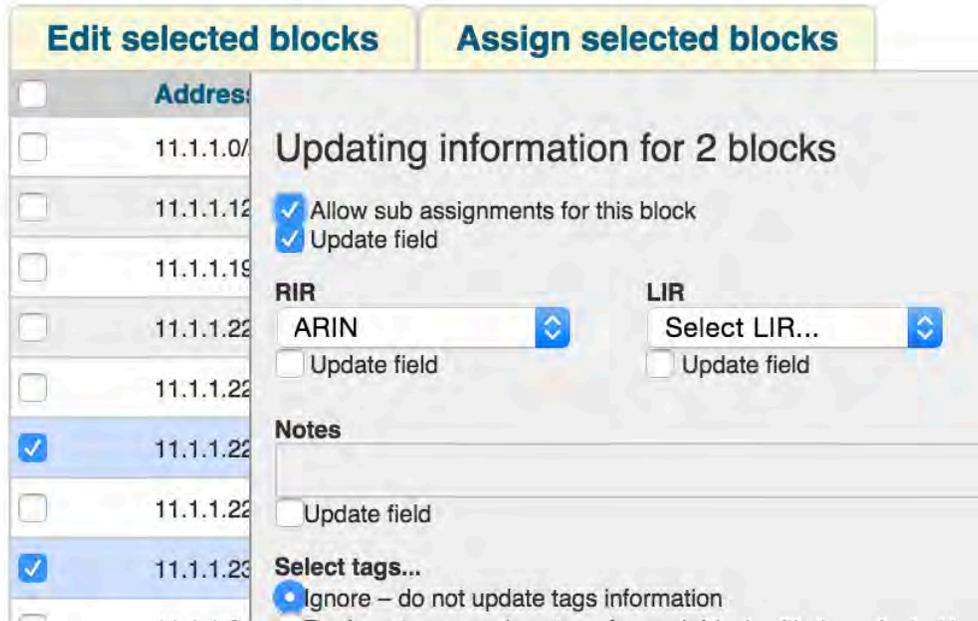

For more details, see the FAQ entry: "How do I 'reserve' IP Space?"

Sub Assigning IP Space

To allow sub assignments, just check the "Allow sub assignments" check box under Edit. Once the allow sub assignments box is checked, the block may be further split and assigned to other resources. Split blocks may also be re-claimed to the originally assigned resource and

re-aggregated. When allow sub assignments is checked, the block is counted as allocated, but not assigned - various statistics in IPAM, on the dashboard, and reporting will reflect this. Sub assignments can be useful for tracking IPs assigned to a customer with multiple subsidiaries, or locations.

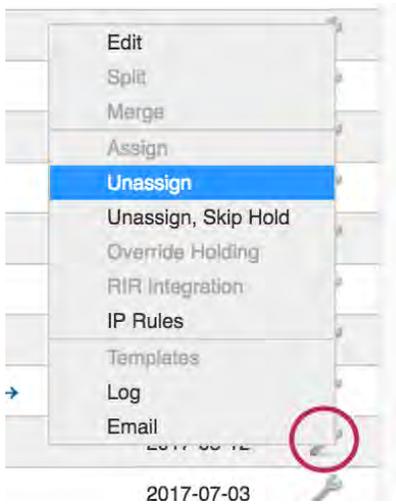

To allow sub assignments for multiple blocks at once, open the Manage screen for the aggregate. Then, select the desired blocks and click "Edit Selected Blocks". The Multi-block edit interface will open. In that interface, select the check boxes next to "Allow sub assignments for this block" and the "Update field" below it. Lastly, save your changes.

Unassigning IP Space

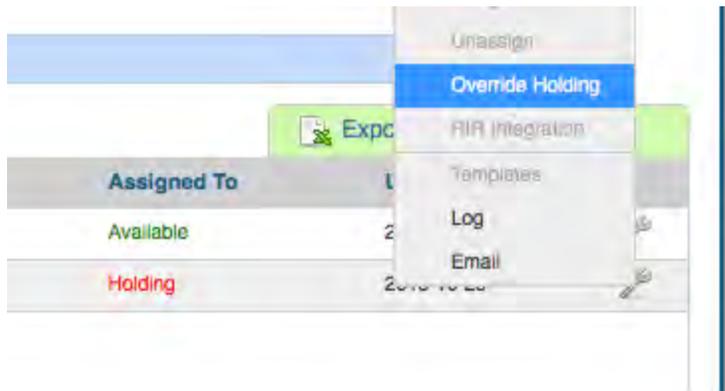

When a block is assigned, you will have the option of unassigning the block from the resource and returning it to the Holding Tank.

To unassign the block, simply click on the Action Menu (wrench icon) for the block and select "Unassign". You may also chose "Unassign, Skip Hold", which unassigns the block and immediately returns it to available, bypassing the holding tank. After unassigning blocks / overriding holding, newly available blocks will be merged upon next page refresh.

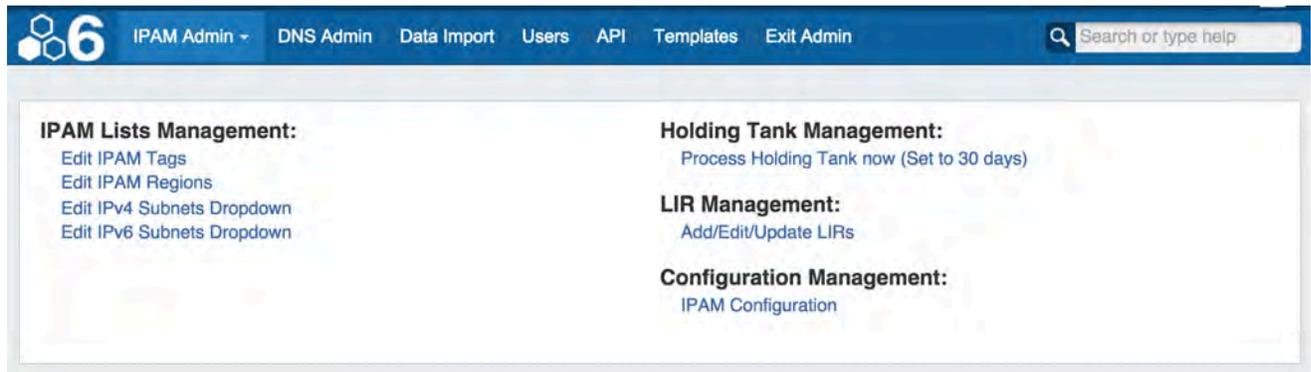

To return IP space in the Holding Tank to the Available Pool - there are two methods:

- 1) Manually override the holding tank

2) Process the Holding Tank via the Admin screen under **IPAM Admin** (this will only process blocks that were present for the specified number of days).

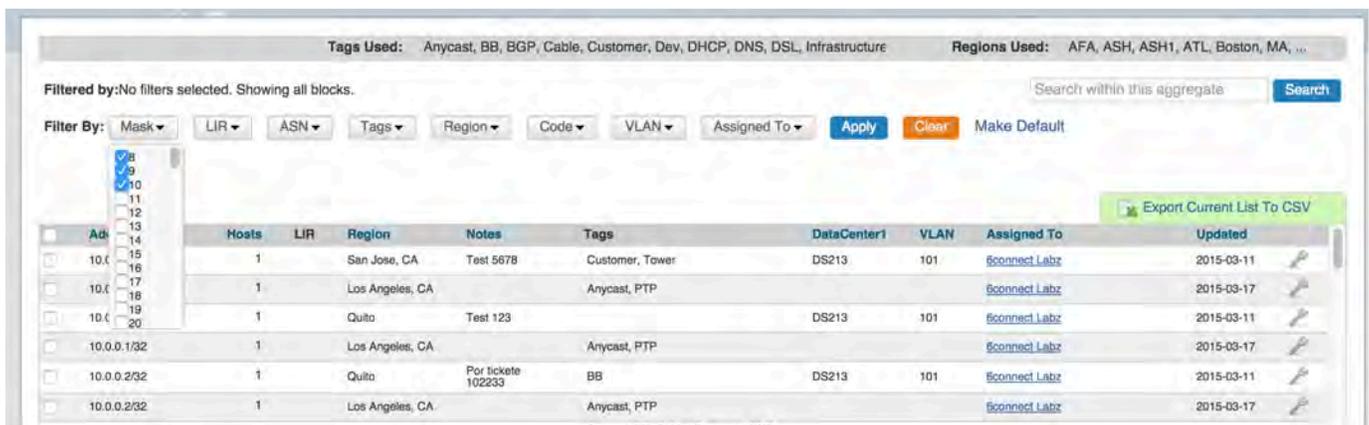

For more information on the Holding Tank, see [Holding Tank Management](#).

View Parent Blocks in IPAM Manage

On the IPAM Manage screen, you have an option to Filter the view by selected Subnet Mask (dropdown). By default, blocks in ProVision are displayed at their child size, the lowest point in the block tree available for that block.

With the Filter By Masks enabled, and multiple or all masks selected, the view changes to include the "Parent" blocks, showing all masks throughout the assignment tree.

A parent block with children will show "Has Children" in the column where assignment status is shown, and the block CIDR will show as a clickable link.

Working with IP Rules

Working with IP Rules

- Working with IP Rules
 - IP Rules
 - Creating a new rule
 - IP Rule Positions
 - Apply an existing rule
 - Remove a rule from a block

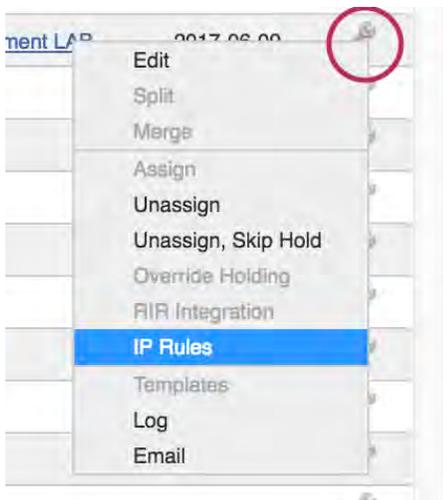

IP Rules

IP Rules allow users to exclude IP addresses from being assigned (via Smart Assign or Direct Assign) based on the address position in the block (i.e., first address, last address, nth from last).

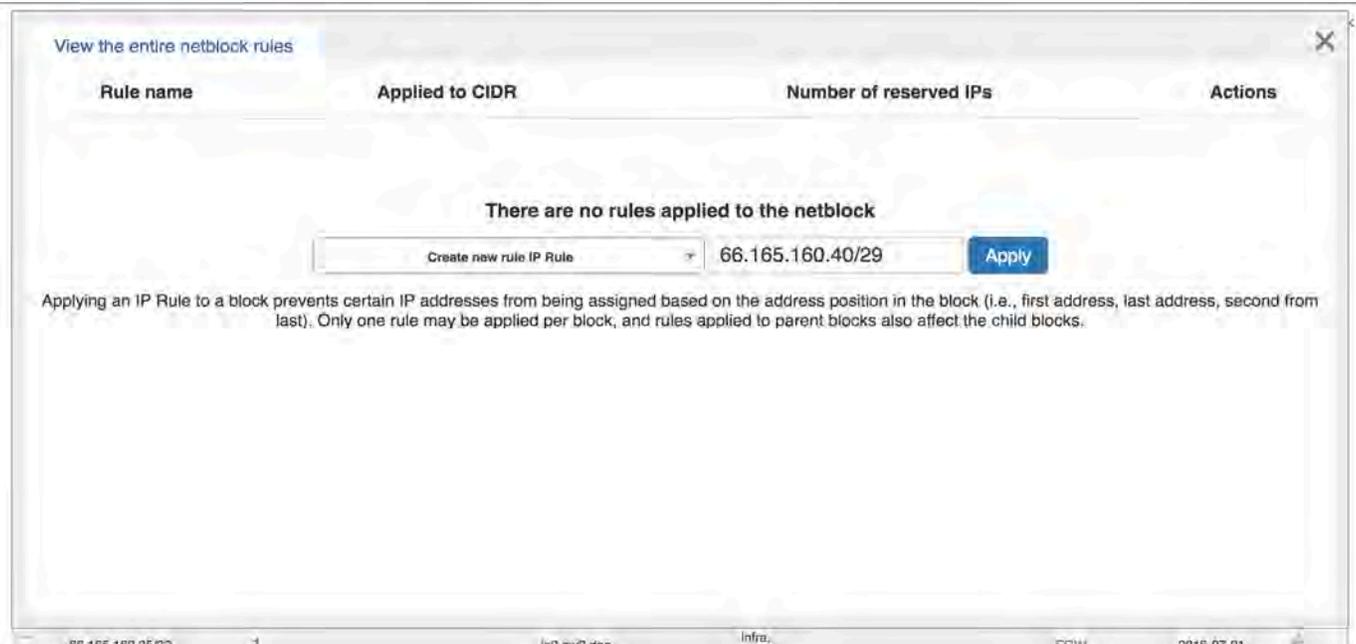

IP Rules can be accessed from IPAM Manage, in the block's Action Menu (wrench icon). IPAM users may view rules applied to a block, apply an existing rule to a block, or create a new rule for a block. Only one rule may be applied per block, and rules applied to a parent block affect the child blocks below it in the tree. Admin users may view all existing IPAM Rules, the blocks affected by each rule, and delete rules through the IPAM Admin - IP Rules page.

Creating a new rule

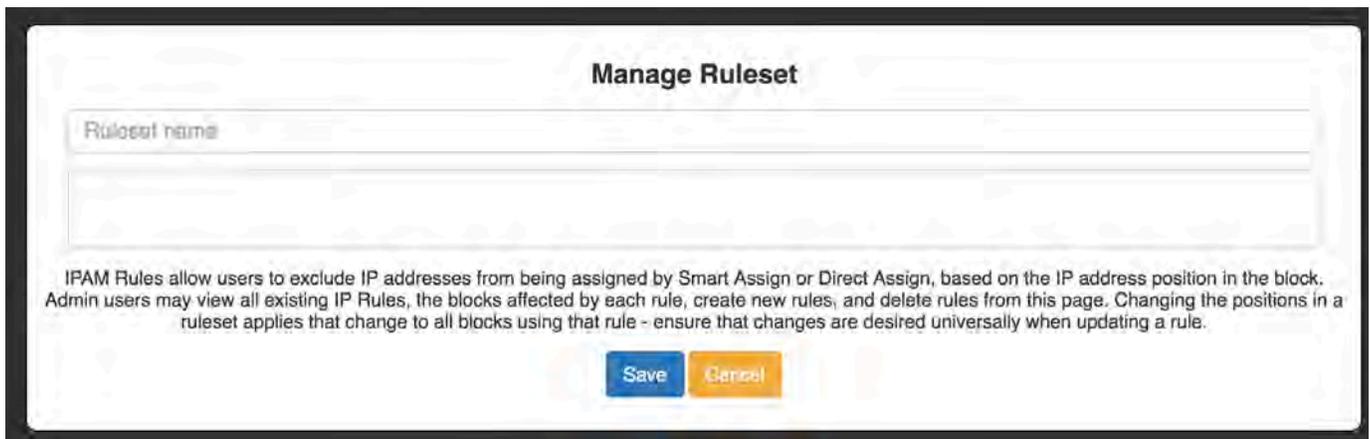

From the IPAM Manage screen, click on the Action Menu (wrench icon) for the block you wish to apply a rule. Select "IP Rules".

The IP Rules screen will pop up. From here, you can view existing rules applied to the block (or the parent block), apply an existing rule, or create a new IP Rule.

To create a new rule, ensure that the dropdown selector is set to "Create new IP Rule", verify that the correct block is shown, then click "Apply".

The Manage Ruleset screen will appear, prompting you to enter a Ruleset name, and select positions to reserve.

IP Rule Positions

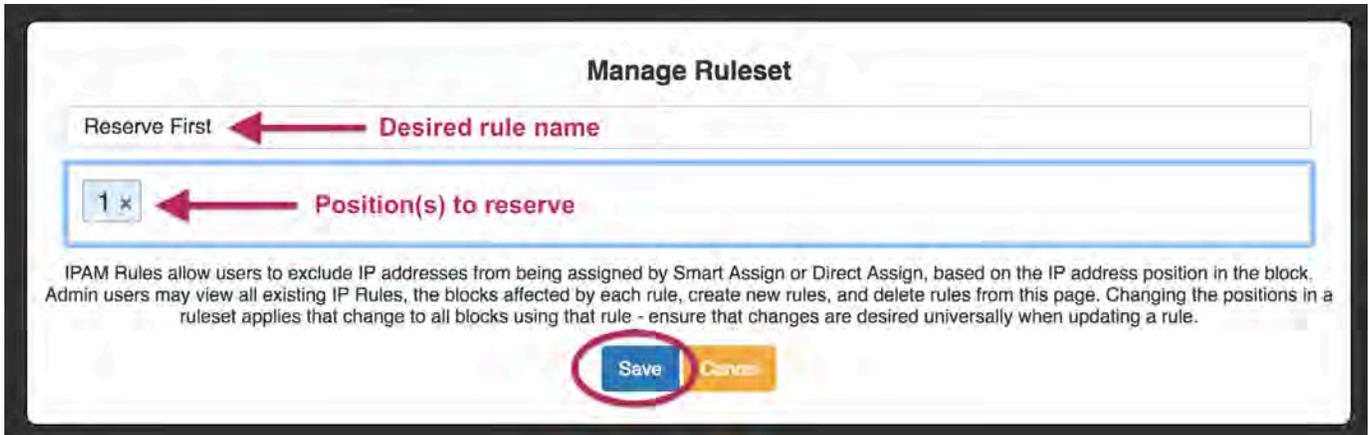

Reserved addresses are set by their position in the block. Positions start at '1', for the first address in a block, and step up by one for each subsequent IP address. The last position in a block is '0', representing the last address, and steps down a negative integer for each position from last - so the last three addresses in a block would be represented by (0, -1, -2). When reserving multiple positions, the typed order of the positions does not matter.

Position examples:

- (1) - Reserves the first IP
- (0) - Reserves the last IP
- (1,2,3) - Reserves the first three IPs
- (0, -1, -2) - Reserves the last three IPs.
- (1,2,3,0,-1,-2) - Reserves the first three and last three IPs

Type in the desired name for the new rule, and one or multiple positions (denoted by integers separated by commas) into the box below the name.

When complete, click the "Save" button, or hit "Cancel" to exit without saving. The Rule preview screen will appear.

Review the list of excluded IP addresses affected by the rule, then click "Apply changes" to finalize the selection.

If desired, you can exit out of applying the rule by clicking "Discard Changes", reverting back to the initial selection screen.

Once changes are applied, the rule will show the name, affected CIDR, affected IPs, and present with an option to remove the rule.

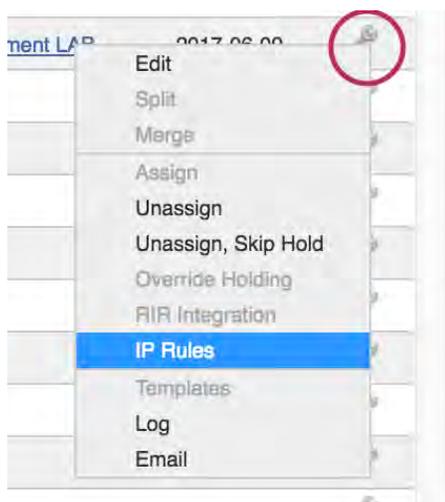

View all rules for 66.146.160.0/19

Rule name	Applied to CIDR	Number of reserved IPs	Actions
Reserve First	66.146.160.40/29	1	Remove rule

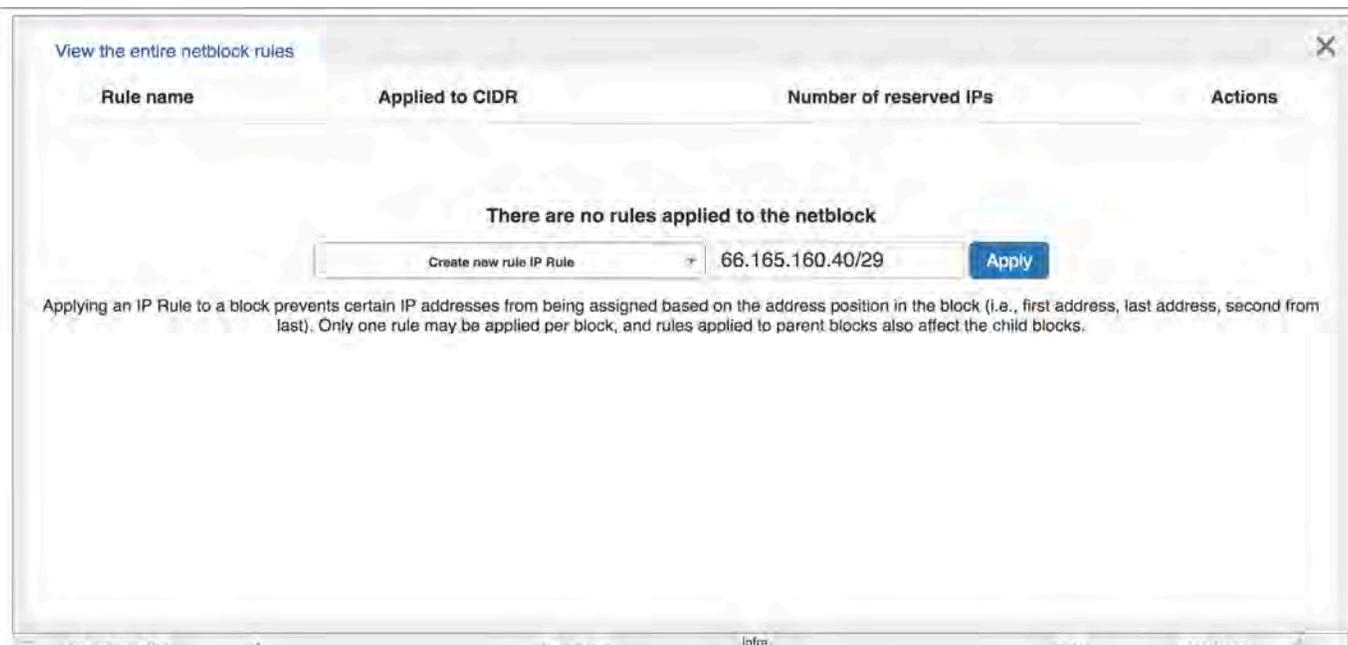

Excluded IP Addresses: 66.146.160.40

Apply an existing rule

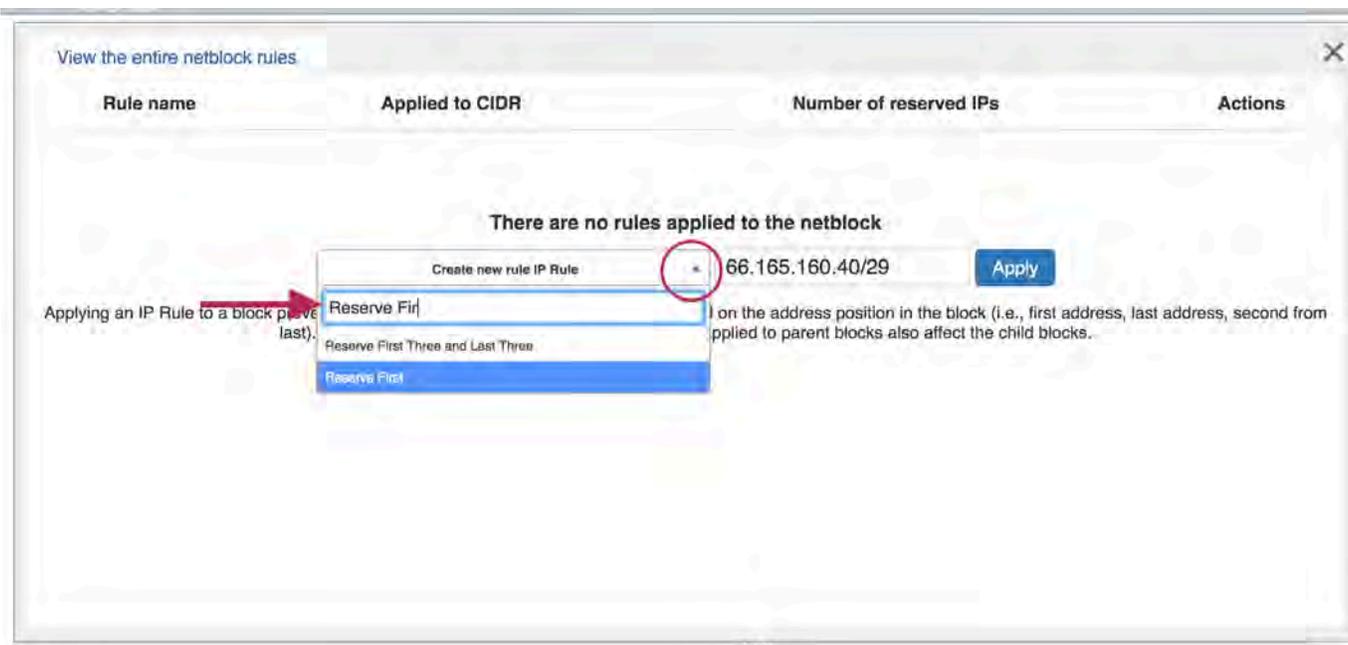

From the IPAM Manage screen, click on the Action Menu (wrench icon) for the block you wish to apply a rule. Select "IP Rules".

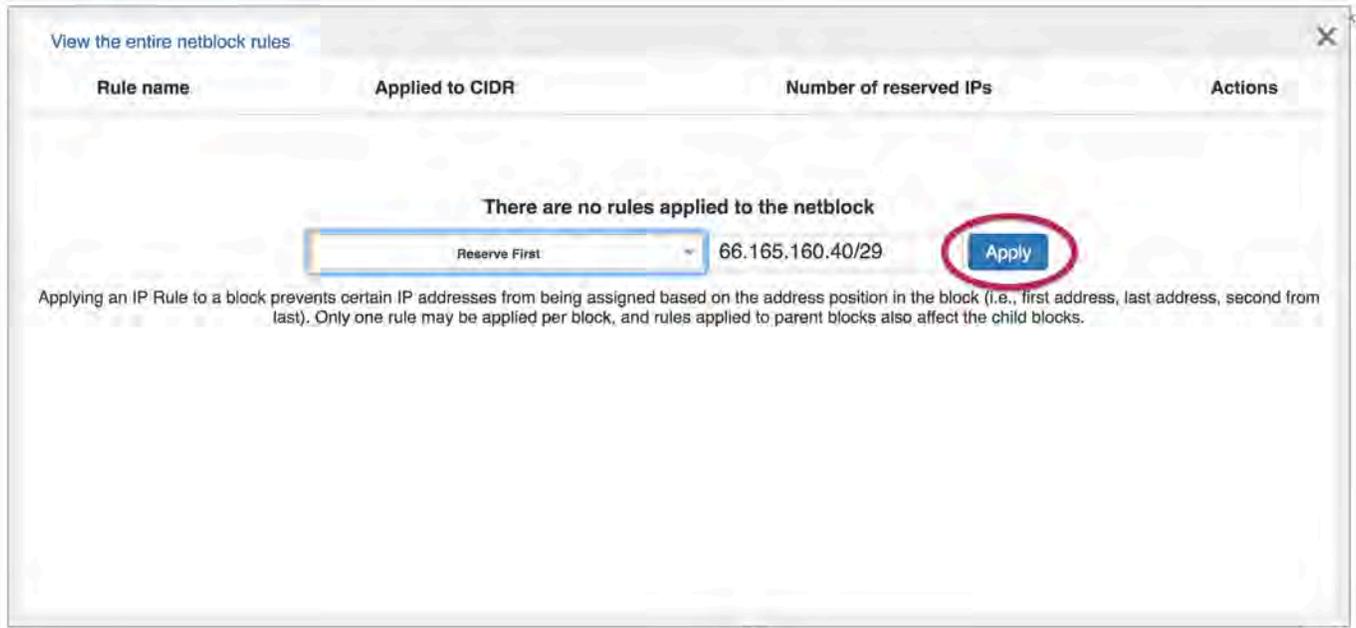

The IP Rules screen will pop up. From here, you can view existing rules applied to the block (or the parent block), apply an existing rule, or create a new IP Rule.

To apply an existing IP Rule to the selected block, click on the dropdown containing "Create new IP Rule", then type in the name of the desired rule and select it from the list.

Once selected, hit the "Apply" Button.

Review the list of excluded IP addresses affected by the rule, then click "Apply changes" to finalize the selection.

If desired, you can exit out of applying the rule by clicking "Discard Changes", reverting back to the initial selection screen.

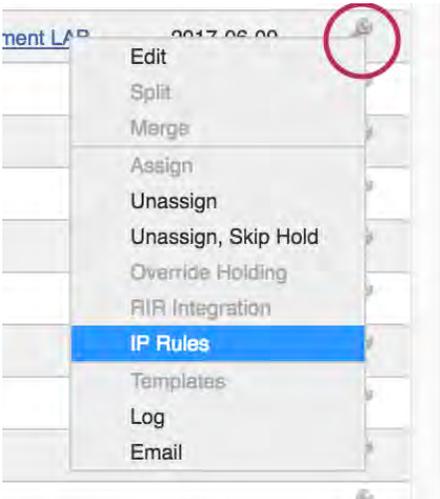

Once changes are applied, the rule will show the name, affected CIDR, affected IPs, and present with an option to remove the rule.

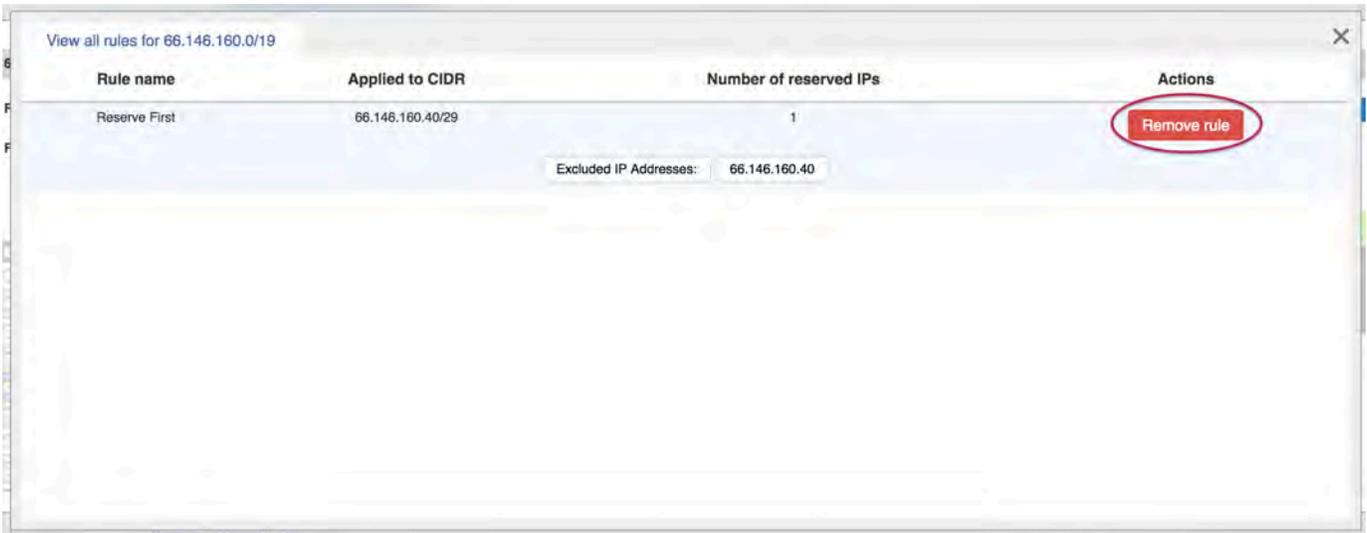

Remove a rule from a block

From the IPAM Manage screen, click on the Action Menu (wrench icon) for the desired block. Select "IP Rules".

The details for the existing rule applied to the block will be shown. To remove the rule from the block, click the "Remove Rule" button and confirm.

The rule will still be able to be re-applied and usable by other blocks, simply no longer applied to the current block.

Peering v2

6connect Peering

The **Peering** tab displays peering stats, allows you to add routers and sessions, and manage communications and sessions for each exchange.

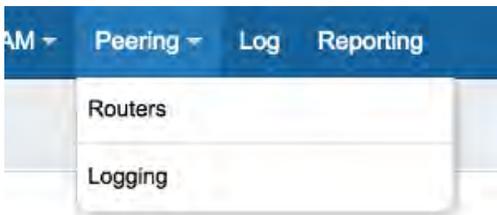

The screenshot shows the 6connect Peering dashboard. At the top, there is a navigation bar with the 6connect logo and menu items: Dashboard, Resources, DNS, DHCP, IPAM, Peering, Log, and Reporting. A search bar is located on the right. Below the navigation bar, there are two tabs: "View by Exchange" (selected) and "View by Peer". On the right side of this section, there are buttons for "Add Router" and "Add Session".

The main content area is divided into several sections:

- Stats:** A table with two columns: "General Info" and "Technical".

General Info		Technical	
PeeringDB ID	2335	Exchanges	1
PeeringDB Name	6connect, Inc.	Total Peers	120
Source ASNs	8038	Qualified Peers	118
		Not Qualified Peers	2
- Equinix Palo Alto - Palo Alto, US:** A detailed view for a specific exchange. It shows IP ranges (198.32.175.0/24 - 198.32.177.0/24 - 2001:504:d::/64), current peers (1), qualified peers (119), not qualified peers (1), rejected requests (0), pending requests (1), sessions tracked (2), and peers without sessions (119). It also lists the most recent request and peer. There are buttons for "Communications" and "Sessions".
- Summary:** A small bar chart on the right showing the distribution of peers: Peered (1), Qualified (119), Unqualified (1), and Rejected (0).

Two other sections are available via the drop down menu:

Routers - Links to the resource list of routers

Logging - View peering related logs

Peering Setup - Local Installations

If you are using a locally hosted instance of ProVision, verify that you have followed the instructions on the [Local Installations - Peering Setup](#) page to set up Peering for your instance.

Peering Views:

Two "Views" are available for the Peering Tab: "View by Exchange", and "View by Peer". The view may be changed by clicking on the "View by ..." buttons at the top left corner of the page.

View by Exchange

"View by Exchange" is the default view for the **Peering** Tab, and is the view where most management tasks will be completed.

The screenshot displays the ProVision interface for managing peering sessions. At the top right, there are buttons for 'Add Router' and 'Add Session'. Below these are two tabs: 'View by Exchange' (selected) and 'View by Peer'. The main content area is divided into three sections:

- Stats:** A summary table showing general and technical information.

General Info		Technical	
PeeringDB ID	2335	Exchanges	1
PeeringDB Name	6connect, Inc.	Total Peers	120
Source ASNs	8038	Qualified Peers	118
		Not Qualified Peers	2
- Equinix Palo Alto - Palo Alto, US:** A detailed view for a specific exchange. It includes IP ranges (198.32.175.0/24 - 198.32.176.0/24 - 198.32.177.0/24 - 2001:504:d::/64), current peer counts (1), qualified peers (119), not qualified peers (1), rejected requests (0), pending requests (1), sessions tracked (2), and peers without sessions (119). A bar chart on the right shows the distribution: Peered (1), Qualified (119), Unqualified (1), and Rejected (0). Buttons for 'Communications' and 'Sessions' are at the bottom.
- Communications - Equinix Palo Alto:** A table listing communication events.

Is Peer	ASN	Peer Name	Request	Notes
<input checked="" type="checkbox"/>	7575	AARNet		2017-05-22 - Session updated: (AS8038/) - (AS7575/198.32.176.177) 2017-05-22 - Session added: (AS8038/) - (AS7575/198.32.176.177) 2017-05-22 - Peer status set to Current Peer 2017-05-12 - Peer status reset
<input type="checkbox"/>	9264	Academia Sinica Network(ASNet)		

At the top right of the page are easily accessed buttons for adding new Routers or New Sessions. See: [Add Routers](#) and [Add Sessions](#) for details.

Next, general information is shown on the Peering data for the set ASNs in ProVision, including PeeringDB information and a breakdown of Peer types.

Below that are modules for specific exchanges - here, we can see peer and session breakdowns for Equinix Palo Alto, including a bar chart of Peered / Qualified / Unqualified / Rejected status types.

Clicking on the "Communications" or "Sessions" buttons for an exchange will open detailed information for all peers or sessions, respectively, currently in ProVision. For details on managing peers and sessions in these areas, see [Peering - Common Tasks](#), [Managing Peer Sessions](#), and [Managing Peer Communications](#).

View by Peer

"View by Peer" is a supplemental reference view that allows for quick lookup of a Peer's PeeringDB information and sessions currently in ProVision for that Peer.

Selecting a Peer from the list at the left shows the PeeringDB information available for that Peer, including profile and policy links.

Peering Policy Information

Peering Policy	https://www.aarnet.edu.au/network-and-services/the-network/network-operations/peering/#Peering%20Policies
General Policy	Selective
Multiple Locations	Preferred
Ratio Requirement	Yes
Contract Requirement	Not Required

Notes:
AARNet has a relatively open peering policy although we like to avoid sub optimal routing.

If sessions exist in ProVision for that Peer, clicking on the "Sessions" tab will show an overall of all sessions, including ASN, assigned router, IP, peer Group, Type, and State.

Peering - Common Tasks

Peering Workflow

The ProVision peering workflow encompasses working with routers, peer groups, sessions, and managing communications.

✓ [Click here to see the graphical workflow...](#)

Below is an outline of the steps needed for a basic workflow process.

- Peering Workflow
 - 1) Add Router(s)
 - 2) Add Peer Groups
 - With a New Router:
 - With an Existing Router:
 - 3) Add Session(s)
 - 4) Configure Sessions
 - Configure Sessions Individually by Exchange:
 - Configure Sessions for Existing / Approved Peers:
 - 5) Manage Communications
 - New Peer:
 - Outgoing Peer Request:
 - Incoming Peer Request:
 - Configure Sessions for Existing / Approved Peers:
 - 6) Repeat for new Routers, Sessions, and Peers.
- Peering Common Tasks

1) Add Router(s)

Associated Task(s): Add Routers

Adding a router is the fundamental base and first step of working with peering in ProVision. Routers may be added through either the "Add Router" button in the **Peering** Tab, or through creating a new entry through the Resources system under the router Section.

The recommended method is to start with the "Add Router" button in the **Peering** Tab.

This dialog will also allow you to add a Peer Group at the same time, merging steps one and two together.

Add Router

Parent Resource: TLR

Name: _____

Make: A10 Networks

Model: 7600 Series

Hostname: _____

IPv4 Address: _____

IPv6 Address: _____

Username: _____

Password: _____

Peer Groups

Exchange: Equinix Internet Exchange

Peer Group: _____

Type: IPv4 IPv6

Add Group

Exchange	Peer Group	Type
No groups specified		

Add Router

For a detailed breakdown of this task, see [Add Routers](#).

2) Add Peer Groups

Associated Task(s): [Add Routers](#), [Gadgets](#)

Associating the router with a peer group is necessary to link the router to a particular exchange. You may add the Peer Group information either in the "Add Router" dialog or in the Peer Group Gadget prior to adding sessions.

With a New Router:

To add a peer group through the "Add Router" dialog: After inputting the Router information, under Peer Groups, select the exchange, type in the name of the desired Peer Group name, select whether it is IPv4 / IPv6, and click "Add Group". Lastly, click "Add Router".

Add Router

Parent Resource: TLR

Name: _____

Make: A10 Networks

Model: 7600 Series

Hostname: _____

IPv4 Address: _____

IPv6 Address: _____

Username: _____

Password: _____

Peer Groups

Exchange: Equinix Internet Exchange

Peer Group: _____

Type: IPv4 IPv6

Add Group

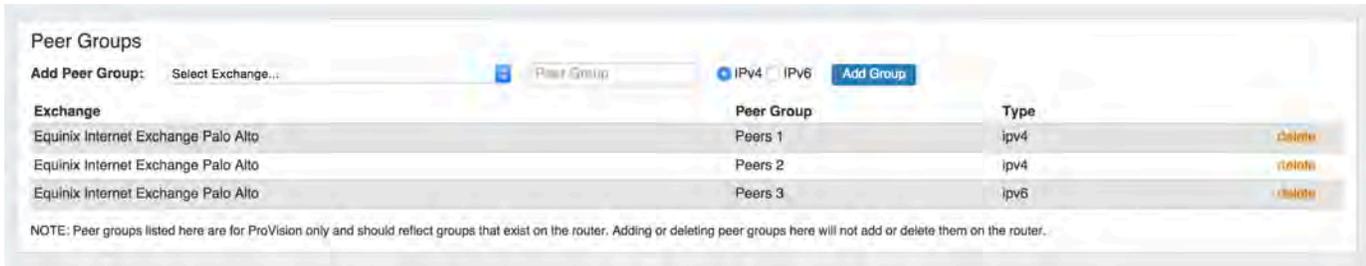

Exchange	Peer Group	Type
No groups specified		

Add Router

With an Existing Router:

If you need to add a Peer Group to an existing router, you may use the [Peer Group gadget](#).

The Peer Group Gadget allows you to add peer groups for IPv4 and IPv6 for a selected exchange from a router's Resource Entry page.

To do this, simply select the exchange, type in a Peer Group name in the text box, select IPv4 or IPv6, then click "Add Group".

Peer Groups added from this gadget will then be available to select in the "Add Session" dialog box in the **Peering** tab.

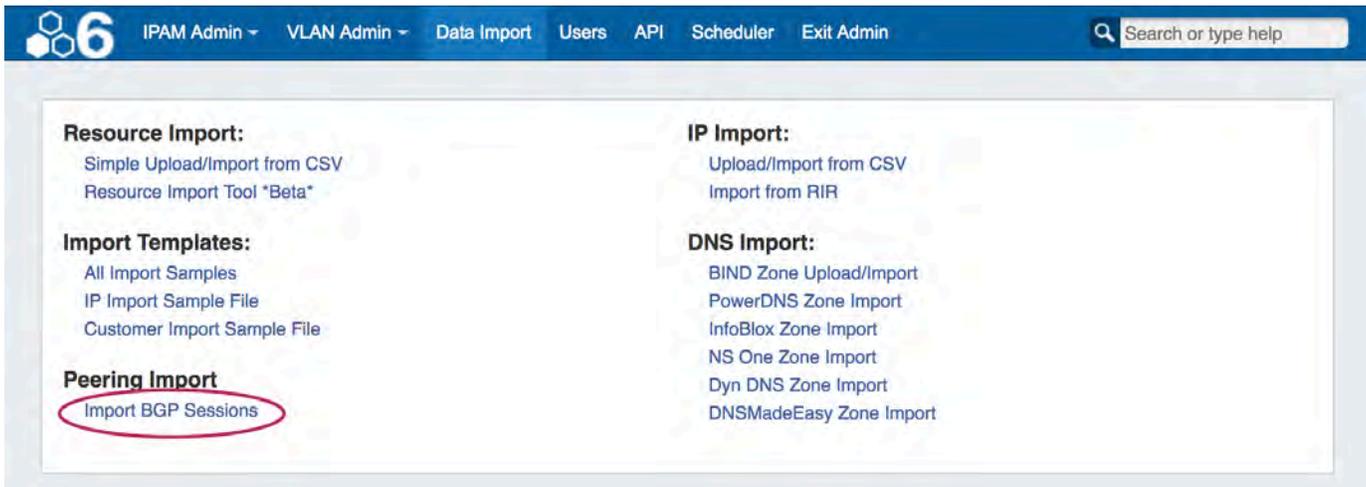

3) Add Session(s)

Associated Task(s): [Add Sessions](#), [Import Sessions](#)

After Routers and Peer Groups have been set up, the next step is Adding Sessions to ProVision.

You may add a new session through the "Add Session" button in the **Peering** tab, or you may [Import Sessions](#) from an existing router. Importing sessions requires Admin level permissions, and is accessed through the **Data Import** Tab in the Admin section of ProVision.

4) Configure Sessions

Associated Task(s): [Managing Peer Sessions](#)

Configure Sessions Individually by Exchange:

Once a session has been added, you will see it in the session list from the [Managing Peer Sessions](#) module. Open the Sessions manager by clicking on the "Sessions" button for the exchange that hosts your session.

close

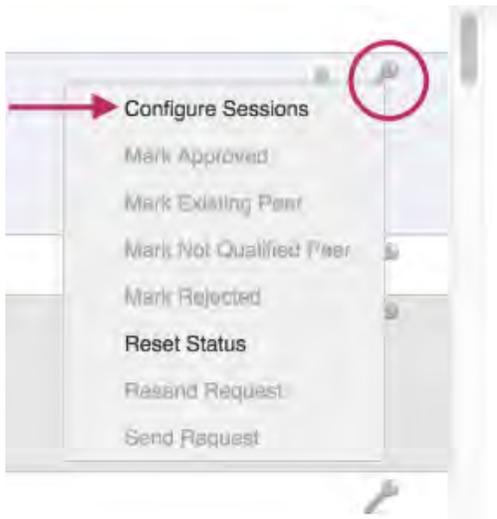

You may configure the session through 1 click config or the Config Manager, accessed by clicking on the Action Menu (wrench icon) for the session. 1 click config uses the default config settings, while the Config Manager allows you to manually create one time use unique settings.

Sessions may also be configured through the Communications list Action Menu, for Peers that have been "Approved" or marked "Existing". Configuring through the Communications menu allows you to configure all sessions for that Peer at once, for any or all exchanges.

Configure Sessions for Existing / Approved Peers:

If a Peer is marked "Existing" or "Approved", the option will appear to "Configure Sessions".

With this option, you can view and configure all sessions for that Peer from one menu (as opposed to the Sessions list configure option, which configures individual sessions by Exchange).

Clicking on "Configure Sessions" opens a modal showing the available exchanges with routers, sessions for that Peer under those exchanges, and options to change the router, peer group, and Peer type.

Select the checkmarks for the desired sessions to configure. As a shortcut, you may also check the "Select all exchanges" option to select all sessions under all exchanges, or, check "Select all networks" next to the exchange header to select all sessions in that exchange. From there, deselect items as needed.

From here, you may manage peer requests, mark peer status, and configure existing sessions for that Peer through the Action Menu (wrench icon).

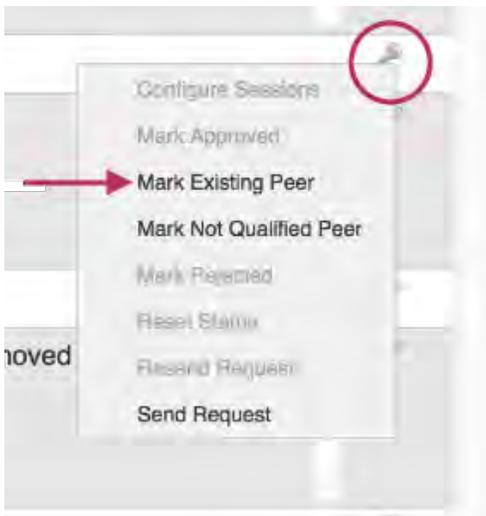

From here the flow depends on the Peer Status and whether a request is Outgoing or Incoming.

New Peer:

For an existing peer that was just added, you can mark the peer as:

a) Mark Existing Peer

This places a green check icon next to the peer in the communications list (seen below) and removes email request options.

or b) Mark Not Qualified

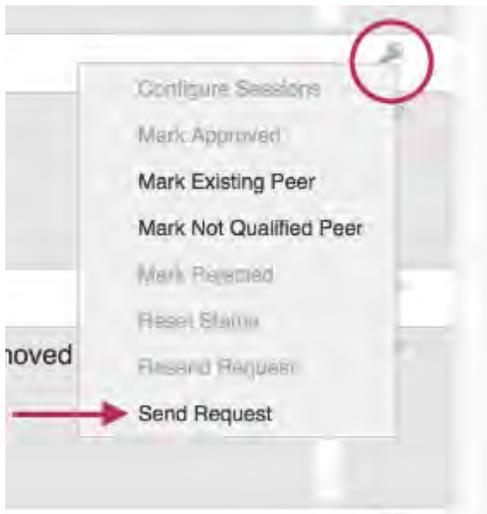

This places a red icon next to the peer in the communications list and notes as not qualified

You may also choose to send an outgoing peer request.

Outgoing Peer Request:

To send out a peer request, select "Send Request" from the Action Menu (wrench icon) . This sends an initial peering request email to the peering coordinator for that peer. The email template pre-populates data based on peeringdb data (To address, Subject line and Peering exchange information). You have the chance to edit the email prior to sending.

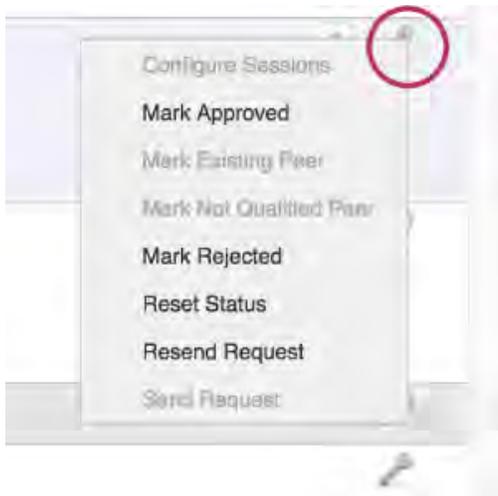

Once a Request has been sent out, it can proceed two ways:

- a) The request is accepted and Peering is established (becomes current peer)
- b) The request is not accepted / responded to, and the "Resend Request" option becomes available, allowing you to repeat the request.

Incoming Peer Request:

If a request is received, you have a few options from which you may mark the peer from the Action Menu:

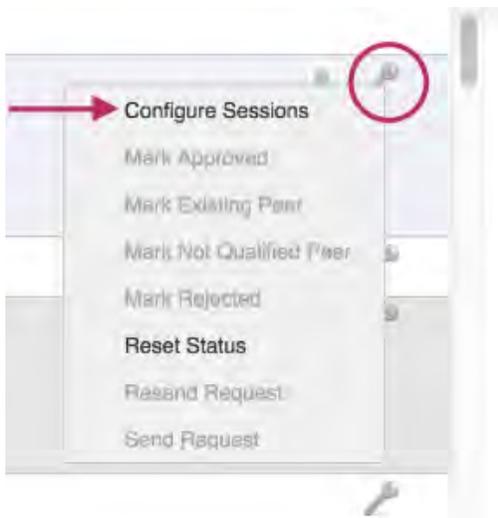

- a) If you accept the request, you may "Mark Approved" and Peering is established (becomes current peer).
- b) You may "Mark Rejected", in which case a peer status is marked rejected.

- c) "Reset Status" is available at various points in the communications process, if you want to reset the peer back to the beginning state and re-establish a different status condition. This reopens the initial options from which you may select a different peer mark.
- d) "Resend Request" may be available to resend a request

Configure Sessions for Existing / Approved Peers:

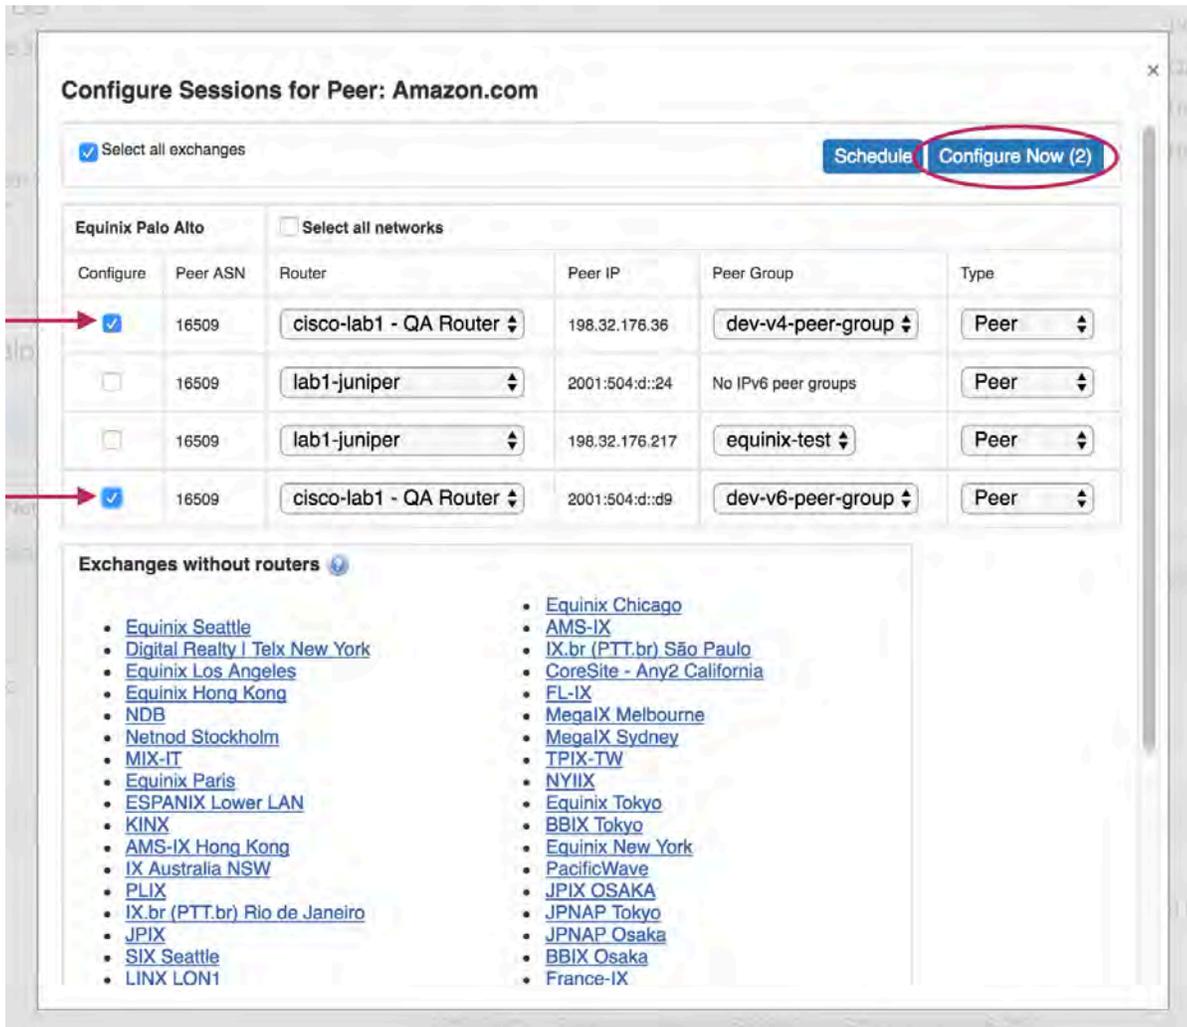

If a Peer is marked "Existing" or "Approved", the option will appear to "Configure Sessions".

With this option, you can view and configure all sessions for that Peer from one menu (as opposed to the Sessions list configure option, which configures individual sessions by Exchange).

Clicking on "Configure Sessions" opens a modal showing the available exchanges with routers, sessions for that Peer under those exchanges, and options to change the router, peer group, and Peer type.

Select the checkmarks for the desired sessions to configure. As a shortcut, you may also check the "Select all exchanges" option to select all sessions under all exchanges, or, check "Select all networks" next to the exchange header to select all sessions in that exchange. From there, deselect items as needed.

When your selections have been made, click "Configure Now" to immediately configure all selected sessions, or you may [schedule the configuration](#) through the [Scheduler](#) Tab.

6) Repeat for new Routers, Sessions, and Peers.

To add additional Routers, Sessions, and Peers repeat steps 1, 2, or 3, and manage your newly added sessions and peer communications similarly with steps 4 and 5.

Peering Common Tasks

Some of the commonly performed peering tasks are listed below. Click on the links for additional information.

- [Add Routers](#)
- [Add Sessions](#)
- [Import Sessions](#)
- [Managing Peer Sessions](#)
- [Managing Peer Communications](#)

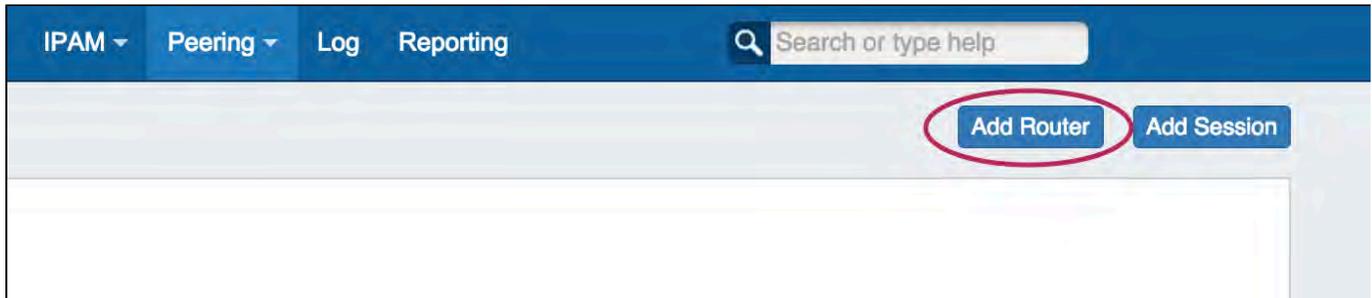

Add Routers

Adding Routers

- Adding Routers
 - Add a Router
 - Adding Juniper Routers with Logical Systems

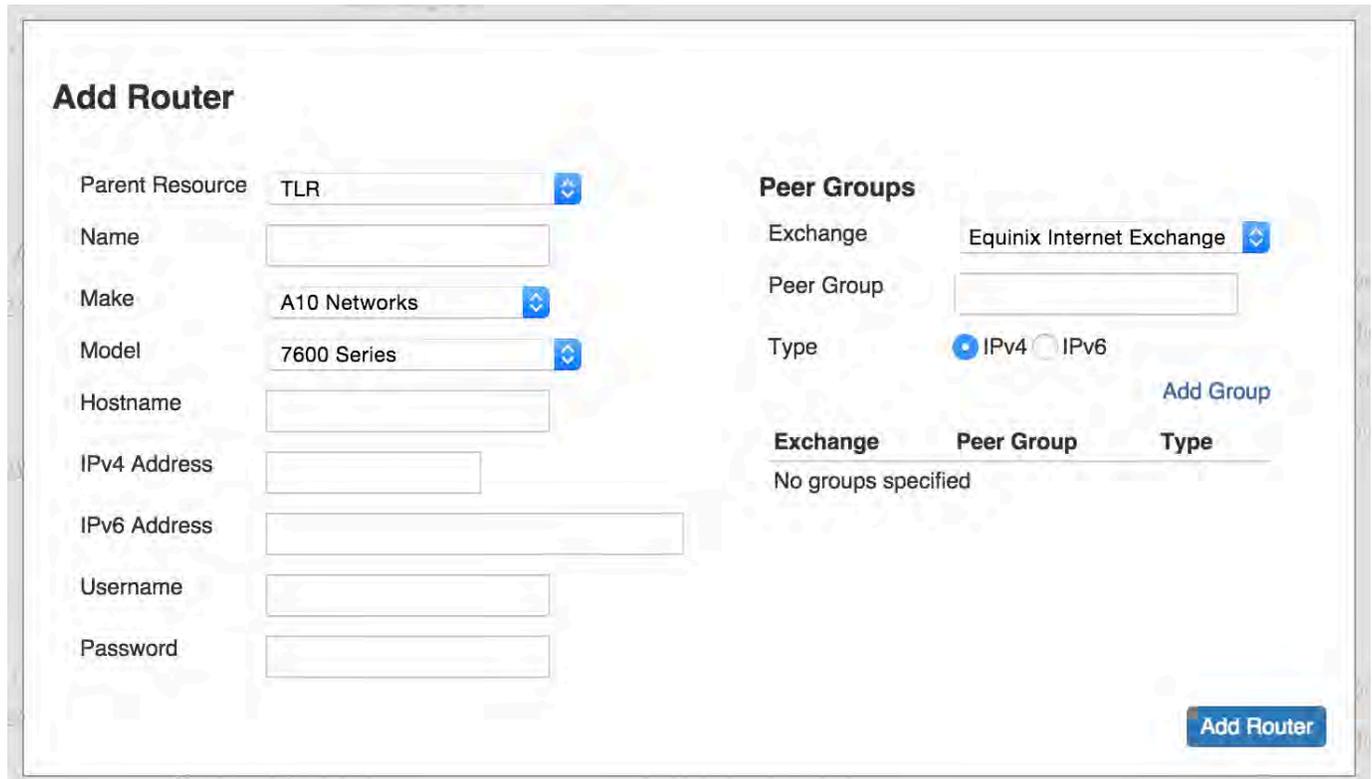

Add a Router

Navigate to the **Peering** tab. Select "Add Router".

The Add Router dialog will pop up. Enter the router information for Parent, Name, Make, Model, Addresses, Username, Password, and Exchange.

For Peer Group, type in the name of the desired Peer Group name, select whether it is IPv4 / IPv6, and click "Add Group". Lastly, click "Add Router".

A screenshot of the 'Add Router' dialog form. The form is titled 'Add Router' and is divided into two main sections: 'Parent Resource' and 'Peer Groups'.
Parent Resource:

- Parent Resource: TLR (dropdown)
- Name: (text input)
- Make: A10 Networks (dropdown)
- Model: 7600 Series (dropdown)
- Hostname: (text input)
- IPv4 Address: (text input)
- IPv6 Address: (text input)
- Username: (text input)
- Password: (text input)

Peer Groups:

- Exchange: Equinix Internet Exchange (dropdown)
- Peer Group: (text input)
- Type: IPv4 IPv6
- Buttons: Add Group

Summary Table:

Exchange	Peer Group	Type
No groups specified		

An 'Add Router' button is located at the bottom right of the form.

Associating the router with a peer group is necessary to link the router to a particular exchange.

Please be sure to add the Peer Group information either in the "Add Router" dialog or in the Peer Group Gadget prior to adding sessions.

Adding Juniper Routers with Logical Systems

Adding a Juniper router with Logical Systems follows the standard process listed above, with one difference - adding in the Logical Systems information.

When you select a Juniper router make/model, the Logical System text field will appear.

Add Router

Parent Resource: TLR

Name:

Make: Juniper

Model: 7600 Series

Logical System:

Hostname:

IPv4 Address:

IPv6 Address:

Username:

Password:

Peer Groups

Exchange: Equinix Internet Exchange

Peer Group:

Type: IPv4 IPv6

[Add Group](#)

Exchange	Peer Group	Type
No groups specified		

[Add Router](#)

Type the Logical Systems information for the router, then resume entering the rest of the router information and peer groups. Hit "Add Router" when complete.

Add Router

Add Router

Routers with Multiple Logical Systems

For routers with multiple associated Logical Systems, you may create duplicate router resources utilizing the same router information, but with different logical systems entries.

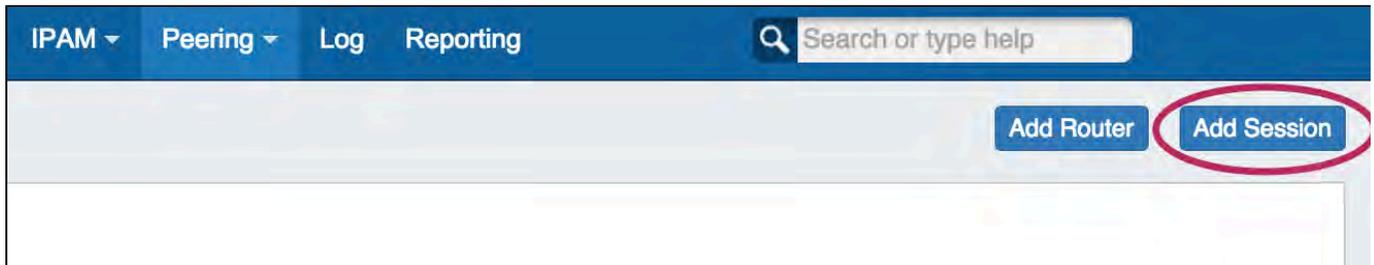

Add Sessions

Add Sessions

- Add Sessions
 - Adding a Peering Session
 - Adding Sessions with Logical Systems Routers

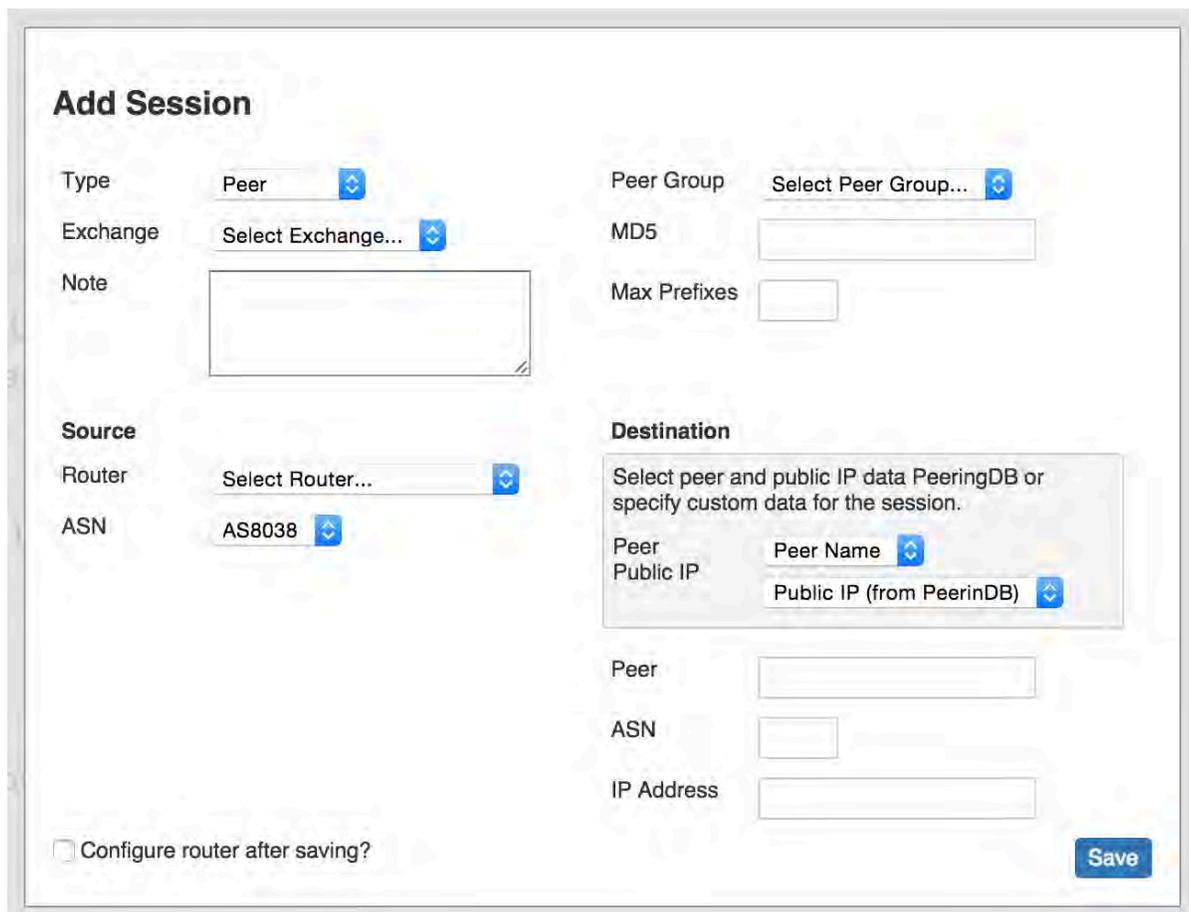

Adding a Peering Session

From the **Peering** tab, Select "Add Session".

In the Add Session dialog, fill out the session information including the session Type and Exchange, the Source information, Peer Group, and the Destination. Destination IP can be pulled from the public PeeringDB information, or custom data may be specified.

If you have **enabled** and **added VRFs** to a router, the source ASNs for the associated VRFs will appear in the source ASN dropdown when adding or editing a session for that router.

A screenshot of the 'Add Session' dialog form. The form is titled 'Add Session' and contains several sections:

- Type:** Peer (dropdown)
- Exchange:** Select Exchange... (dropdown)
- Note:** Text area
- Peer Group:** Select Peer Group... (dropdown)
- MD5:** Text input
- Max Prefixes:** Text input
- Source:**
 - Router:** Select Router... (dropdown)
 - ASN:** AS8038 (dropdown)
- Destination:** Select peer and public IP data PeeringDB or specify custom data for the session.
 - Peer Public IP:** Peer Name (dropdown)
 - Public IP:** Public IP (from PeeringDB) (dropdown)
 - Peer:** Text input
 - ASN:** Text input
 - IP Address:** Text input
- Configure router after saving?
- Save** button

If you would like for the router to be automatically configured when adding your session, check the "Configure Router After Saving" box, then hit "Save". If left unchecked, the session can always be configured later in the Peering Manager.

Adding Sessions with Logical Systems Routers

After having added a Logical System to a router, that router + Logical System combination will be available to select in the Peering - Add Session dialog box. Look for the router name, with the Logical System info in parenthesis (e.g. "Juniper (test)").

The Peer Group associated with that router / Logical System will automatically be selected. Continue to fill in your session information, then hit "Save".

Add Session

1) Filter Options: The sessions list may be filtered by Peer, Source ASN, Destination ASN, IP Type, Session Type, or State. Once you've chosen the filter criteria, click on "Filter". Select "Clear Filters" to return to the full session list.

2) Add Session: A session can be added from the Peering Manager just like the [Add Session](#) at the top of the Peering page - the exchange field is simply automatically filled with the current exchange.

3) Session Information: Lists session Source, Router, Peer, Destination, Peer Group, Type, Prefixes Received / Max Prefixes, State, and Notes.

4) Action Menu (Wrench Icon): Clicking on the wrench icon will bring up the following tools to manage your sessions:

Action Menu (Wrench Icon) Options

Edit: Edit session information such as Type, Exchange, Source, Peer Group, Prefixes, or Destination.

Configure: 1-click configure which uses default router configuration, username, and password settings.

Config Manager: The Config Manager allows for custom configuration commands and user-level username/ password to be entered prior to pushing the config. This is a one time use configuration.

Email NOC: Brings up the NOC (Network Operations Center) email template. The email template pre-populates data based on peeringdb data (To address, Subject line and Peering exchange information). You have the chance to edit the email prior to sending.

Email Policy: Brings up the policy email template. The email template pre-populates data based on peeringdb data (To address, Subject line and Peering exchange information). You have the chance to edit the email prior to sending.

Email Technical: Brings up the technical email template. The email template pre-populates data based on peeringdb data (To address, Subject line and Peering exchange information). You have the chance to edit the email prior to sending.

Admin Up: Ups a bgp session without removing it or adding it to the config.

Admin Down: Downs a bgp session without removing it or adding it to the config. On Cisco, Admin Down moves the session to Idle (Admin) state, on Juniper it deactivates the session.

Delete: Sessions of type "Peer" are removed from the router when deleted in ProVision. Other sessions will only be removed from the sessions list in ProVision.

Additional Information:

For detailed information on the workflow for managing sessions, see [Peering - Common Tasks](#)

Managing Peer Communications

Action Menu (Wrench Icon) Options

Select the wrench icon to manage the communication status:

Configure Sessions: Opens up a module to configure all existing sessions in ProVision for that Peer. This option become available once a Peer is marked "Existing" or "Approved".

Mark Approved: Marks the peer as approved. Available after receiving a request response.

Mark Existing Peer: Marks a peer as an existing one and removes the email request options.

Mark Not Qualified Peer: Marks a peer as "not qualified" and removes the email request options.

Mark Rejected: Marks the peer as rejected. Available after receiving a request response.

Reset Status: Resets the status of the peer, opening up the options to mark peer as existing, not qualified, or to send email requests.

Resend Request: Resends the peering request.

Send Request: Sends an initial peering request email to the peering coordinator. The email template pre-populates data based on peeringdb data (To address, Subject line and Peering exchange information). You have the chance to edit the email prior to sending.

Additional Information:

For detailed information on the workflow for managing communications, see [Peering - Common Tasks](#)

Log

Log

The 6connect ProVision log provides detailed information on actions performed in ProVision.

Time	User	Level	Category	Message
2016-09-15T17:32:34+0000	Unknown	Info	User	Session timeout.
2016-09-15T17:32:34+0000	ops@6connect.com	Info	User	ops@6connect.com logged in via local authentication
2016-09-15T17:32:26+0000	Unknown	Info	User	Session timeout.
2016-09-15T17:32:26+0000	Unknown	Info	User	Session timeout.

Log Features

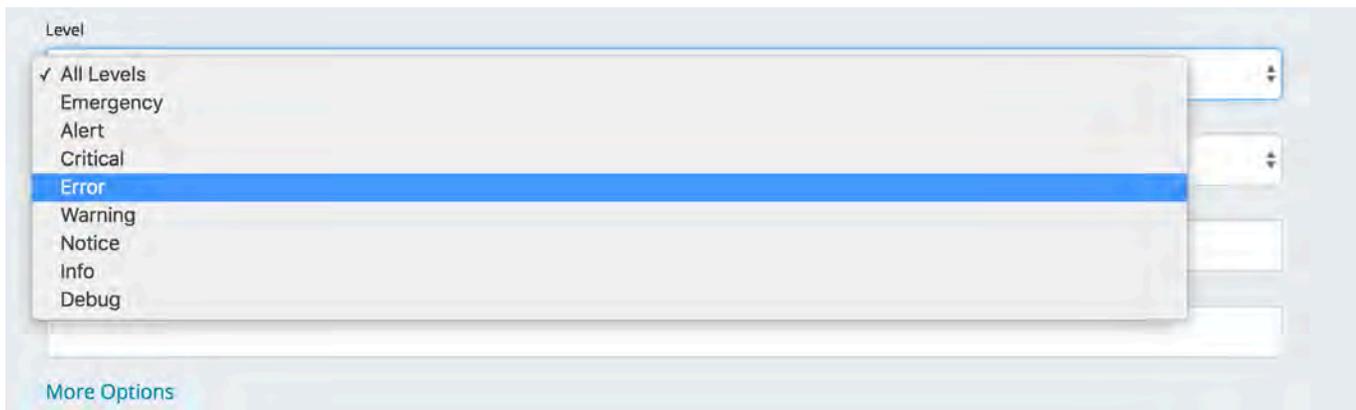

Filters and search options:

Filter the log list by selecting (or typing) the desired filter value at the top of the Log page, then click on the "Search" button.

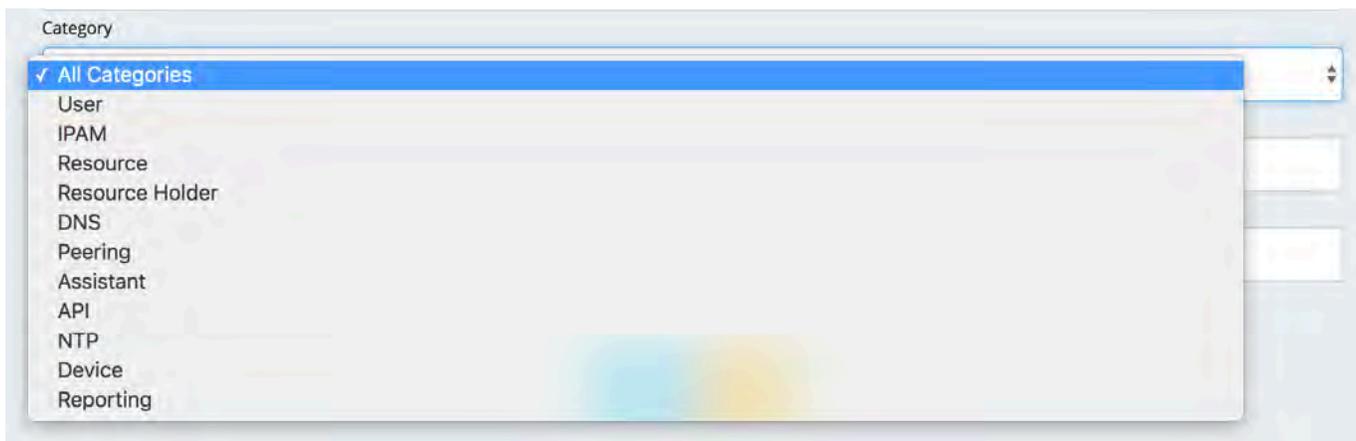

Additional options are made visible by clicking on the "More Options" link below "Search".

The following filters and options are available:

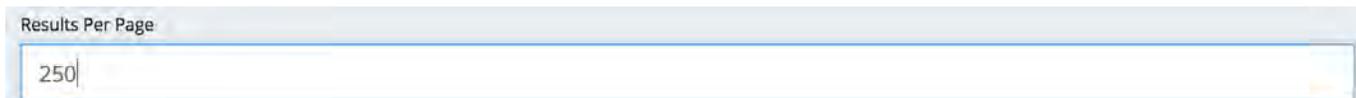

Level: Under the "Level" dropdown box, select "All Levels", "Emergency", "Alert", "Critical", "Error", "Warning", "Notice", "Info", or "Debug".

Category: Under the "Category" dropdown box, select "All Categories", "User", "IPAM", "Resource", "Resource Holder", "DNS", "Peering", "Assistant", "API", "NTP", "Device", or "Reporting".

Results per page: In the "Results per page" text box, type the desired number of log entries to see per page. By default, this value is set to 100.

Search: Type a search string, such as the name of a resource, then click the "Search" button.

More Options:

Additional detailed filter and search options are available under the "More Options" link.

Log ID: Retrieve a specific log entry from its log_id parameter.

IP: Search by IP of the machine that created the event in the log.

Username: Filter logs by ProVision username, or by "Unknown" user.

Time: Filter log entries by exact time created. Must be in datetime format (2016-08-14 16:41:18).

Time Minimum: The earliest day and time of log entries to show in results. Must be in datetime format (2016-08-14 16:41:18).

Time Maximum: The latest day and time of log entries to show in results. Must be in datetime format (2016-08-14 16:41:18).

Tip

Use "Time Minimum" and "Time Maximum" together to specify a specific date / time range, such as one 24 hour period:

Time Minimum (ex. 2016-07-15 16:58:19)
2016-08-14 16:41:18
Time Maximum (ex. 2016-07-15 16:58:19)
2016-08-15 16:41:18

Log Details:

Clicking on the blue arrow on the left side of each log entry expands the entry to show additional details pertaining to that entry.

Not all fields may be populated, and not all log types have applicable details.

	2016-09-15T20:44:49+0000	ops@6connect.com	Info	Resource	Added test-03 (#190)
Key	Value				
id	1476				
log_id	2598				
type	resource_id				
string_value					
number_value	190				
text_value					
date_value	2016-09-15				
address_value					
address_end_value					

Detail fields may include:

id: The id of the log detail record.

log_id: The id of the parent log entry (the entry that was clicked to reveal details).

type: Log category value.

string_value: String details.

number_value: For resource type log entries, the number_value is the associated resource id.

text_value: API details for API type log entries.

date_value: Day of the log entry.

address_value: For IPAM type log entries, address_value is the starting integer value of the IP Block.

address_end_value: For IPAM type log entries, address_value is the ending integer value of the IP Block.

Reporting

Reporting

The ProVision **Reporting** tab provides an overview of program statistics, as well as a way to view and download activity information.

- Reporting
 - Stats
 - Reports
 - User Activity
 - Customer List
 - IPAM

Stats

Items of interest provided under stats include most recent login, number of Resources, DNS zone breakdowns, IPAM hosts, and estimated IP runout time.

The screenshot shows the ProVision Reporting dashboard. At the top is a navigation bar with the ProVision logo and menu items: Dashboard, Resources, DNS, DHCP, IPAM, Peering, Log, and Reporting. A search bar is on the right. The main content area is divided into three sections:

- Environment:** A table showing system information.

Last Login:	12/15/2014 - 10:33:27
Last User:	ops@6connect.com
Total Resources:	435
Total Contacts:	11
- DNS Stats:** A table showing DNS zone and record statistics.

Total Zones:	987	Total A Records:	1883
Forward Zones:	664	Total AAAA Records:	1
Reverse Zones:	323	Total PTR Records:	77412
Total NS Records:	3955	Total MX Records:	745
- IPAM Stats:** A table showing IP address pool statistics for IPv4 Public, IPv4 1918 (Private), and IPv6.

IPv4 Public		IPv6	
Total IPv4 Hosts:	1,187,264	Total IPv6 Hosts:	158,456,325,028,528,675,187,087,900,672
Total Assigned IPv4 Hosts:	3,690	Total Assigned IPv6 Hosts:	1,209,019,206,256,502,329,311,232
Total Available IPv4 Hosts:	1,183,574	Total Available IPv6 Hosts:	158,455,116,009,322,418,684,758,589,440
IPv4 Assigned Date Range:	09/16/2013 – 12/10/2014 (450 days)	IPv6 Assigned Date Range:	11/27/2013 – 11/03/2014 (341 days)
IPv4 Assigned Rate :	8 hosts/day	IPv6 Assigned Rate :	3,545,510,868,787,396,608,000 hosts/day
IPv4 Projected Runout :	395 years, 163 days	IPv6 Projected Runout :	122443 years, 63 days
IPv4 1918 (Private)			
Total 1918 Hosts:	33,620,208		
Total Assigned 1918 Hosts:	3,160,418		
Total Available 1918 Hosts:	30,459,790		
1918 Assigned Date Range:	11/01/2013 – 12/10/2014 (405 days)		
1918 Assigned Rate :	7,804 hosts/day		
1918 Projected Runout :	10 years, 253 days		

Reports

User Activity

To run a User Activity report, simply select the user from the drop down menu and a desired date range for the report. Clicking on "Show Data" will show the User, IP, Timestamp, and Action in a table at the bottom of the page. To export the data to .csv, simply select "Download CSV".

User Activity

User:

All Users

From: 03/29/2015

To: 04/08/2015

Show Data Download CSV

Customer List

The Customer List report reflects all Resources created under the Category of "Customer". Clicking on "Show Data" will show information collected from the Contact Info and Tech Info gadgets, parent information, and IP / zone assignment counts. To export the data to .csv, simply select "Download CSV".

Customer List

Show Data Download CSV

IPAM

The IPAM report is highly customizable, allowing you to view information for all aggregates or selected blocks.

Required Fields: IPv4 and/or IPv6 must be selected for the report.

Optional Fields: Assigned, SWIP status, Assignment / Update dates, RIR, Assigned to Resource, Region, Tag, and Generic Code (in this case, "Datacenter1") are all optional parameters to narrow your results.

IPAM

All Aggregates

IPv4 IPv6 Assigned? SWIPed/RIR Synchronized?

Note: The default number of entries returned in the Reporting section for either html or .csv is limited to 5000 rows. If more rows are needed, the ProVision API may be used to retrieve larger datasets.

User Preferences

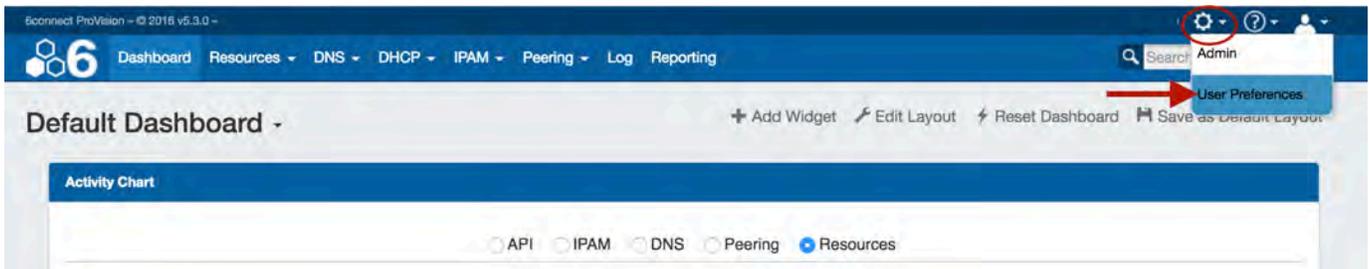

User Preferences

The User Preferences page allows the logged in user to reset their password as well as adjust per-user settings.

- User Preferences
 - Accessing User Preferences
 - Editing Preferences

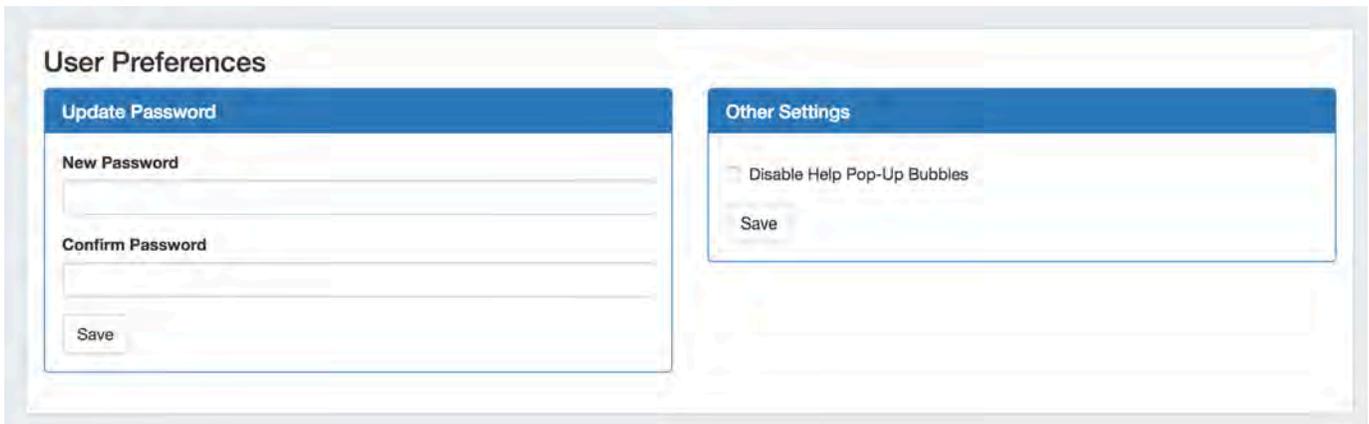

Accessing User Preferences

To access the User Preferences page, click the gear icon at the top right section of the header from any page. From there, select "User Preferences". You will be redirect to the User Preferences page.

Editing Preferences

The User Preferences page includes a section for updating the user's ProVision password, and Other Settings.

Update Password:

To update your password, type the new password in the "New Password" box, then retype under "Confirm Password" for verification. When complete, click the "Save" button.

Other Settings:

Under "Other Settings", help pop-up bubbles may be enabled or disabled. Click the check box next to "Disable Help Pop-Up Bubbles" to disable, or leave unchecked to keep enabled. When complete, click the "Save" button.

To leave the User Preferences page, click on any ProVision tab in the navigation bar.

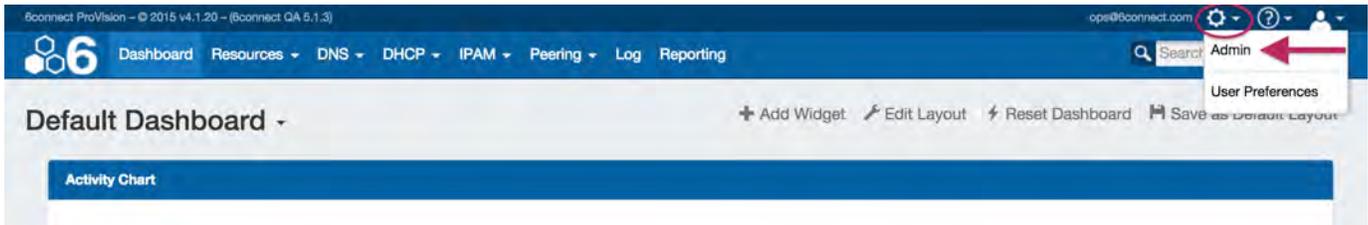

ProVision Admin Guide

Admin Guide

The ProVision Admin Guide provides information on features accessible with Admin level permissions within ProVision. For more detailed information on features accessible in the standard user tabs, see the [ProVision User Guide](#).

Accessing the ProVision Admin section

To access the Admin area, click the gear icon at the top right section of the header from any page. From there, select "Admin". You will then have access the Admin section tabs of ProVision, and will see the Admin Preferences page.

Leaving the ProVision Admin section

To leave the Admin area, simply click the "Exit Admin" link in the navigation bar. You will be redirected to the Dashboard.

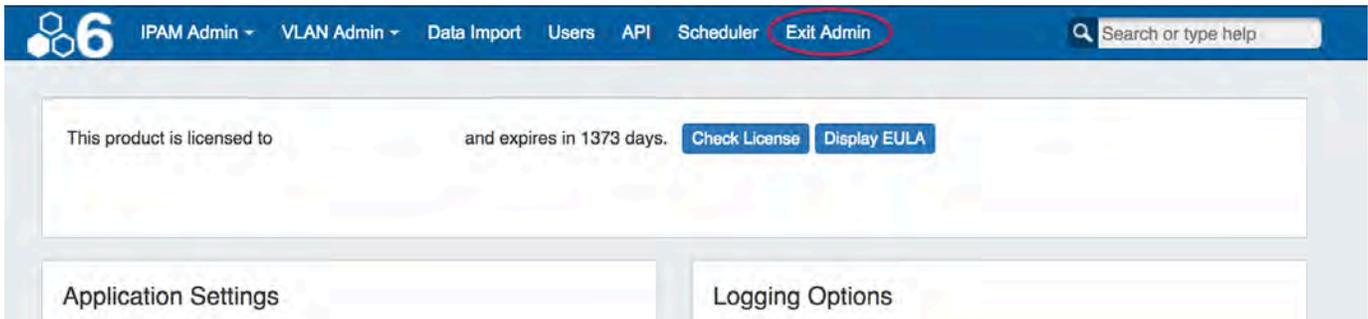

Table of Contents

- [Admin Preferences](#)
- [Authentication Options](#)
- [IPAM Administration](#)
- [VLAN Administration](#)

Video Walkthrough

Note: Video applies to versions 5.3.3 and earlier.

License Info

This section provides basic information on your 6connect license including the option to view the *EULA* and check your license status.

Application Settings

Application Settings is where you provide company specific info that appears in the header and Dashboard.

A screenshot of a web form titled "Application Settings". The form has several input fields and a dropdown menu. The fields are: "Time Zone" with a dropdown menu showing "America/Los_Angeles"; "Company Name" with a text input field containing "6connect"; "Generic name" with a text input field containing "Customer"; "Header Image" with a text input field containing "/images/topbar-logo.png", a dimension label "64 x 38px", and a file selection button "Choose File" next to the text "No file chosen"; "Support Email" with an empty text input field; and "Support Phone" with an empty text input field. At the bottom right of the form is a blue "Update" button.

Time Zone: Supported Time zones are listed here: {EXT} <http://www.php.net/manual/en/timezones.php>. Default value is ('America/Los_Angeles') and can be modified at any time via the drop down menu

Company Name: Enter the preferred name for your company to be used.

Generic Name: This "short" name is used in abbreviated location for the "Customer" tab label, "Customer" and "Site" are common entries.

Header Image: Select an image file for the header

Support Email: Support Email address that displays on the Dashboard

Support Phone: Support phone number that displays on the Dashboard

Application Settings - Local Installation

Additional settings are available for local installations:

- ▼ [Local installations: Click here for additional settings...](#)

Application Settings

Time Zone	America/Los_Angeles	
Company Name	6connect	
Generic name	Customer

DNS Settings

DNS Global Settings

checkzone path	/usr/sbin/named-checkzone	
	File permissions: 0755	
rndc path	/usr/sbin/rndc	
dig path	/usr/bin/dig	

DNSSEC Tools

zonesigner path	/usr/local/bin/zonesigner	
dnssec-dsfromkey path	/usr/sbin/dnssec-dsfromkey	
DNSSEC validation server	8.8.8.8	

Nonauthoritative nameserver required.

[Update](#)

DNS Global Settings

Checkzone path : Enter the checkzone path that will be used for DNS.

rndc path : Enter the rndc path that will be used for DNS.

dig path : Enter the dig path that will be used for DNS.

DNSSEC Tools

If using DNSSEC, enter the following information:

zonesigner path : Enter the zonesigner path that will be used for DNS.

dnssec-dsfromkey path : Enter the dnssec-dsfromkey path that will be used for DNS.

DNSSEC validation server: Enter the IP of the nonauthoritative DNSSEC validation nameserver.

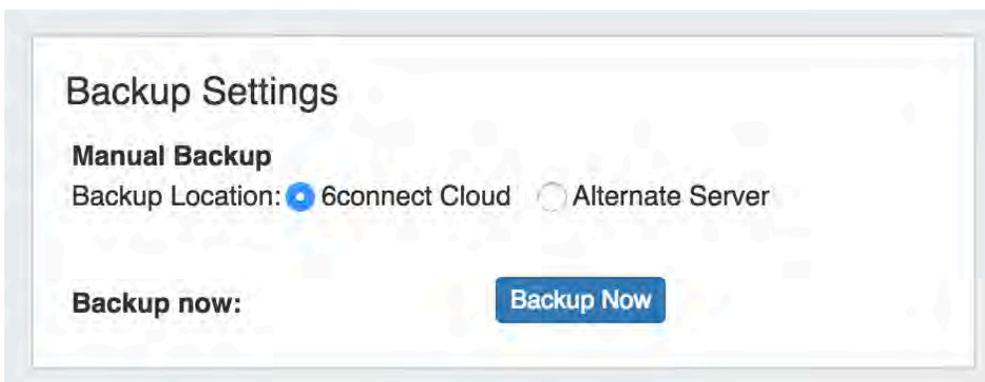

Peering Settings

ASN : Enter the ASN(s) that will be used for Peering, or may leave blank. Separate multiple ASNs with a comma.

VRF Support: Check to enable adding the VRF gadget to the router Section. Currently, only supports Cisco routers.

Backup Settings

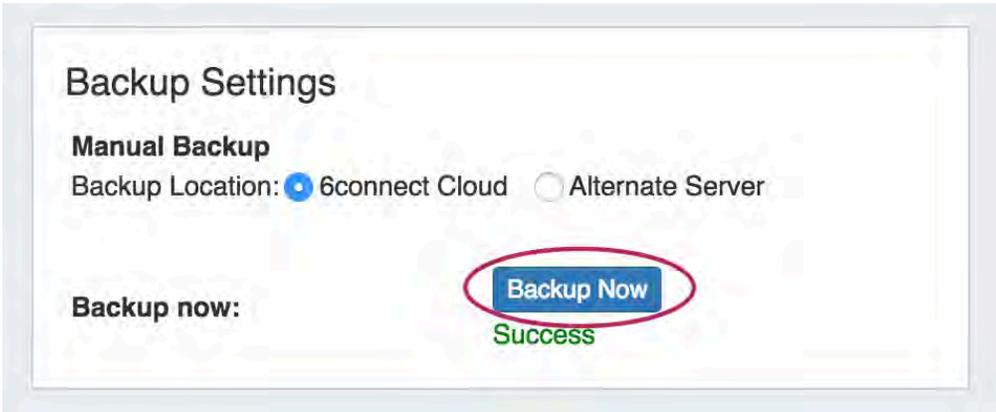

For cloud users, regular backups can be set up through the Scheduler. However, prior to imports or other large changes, you may wish to manually perform a backup.

Backup Location: The backups may be sent to the 6connect cloud, or to a specific server in the Resource system. Select the radio button for the desired location.

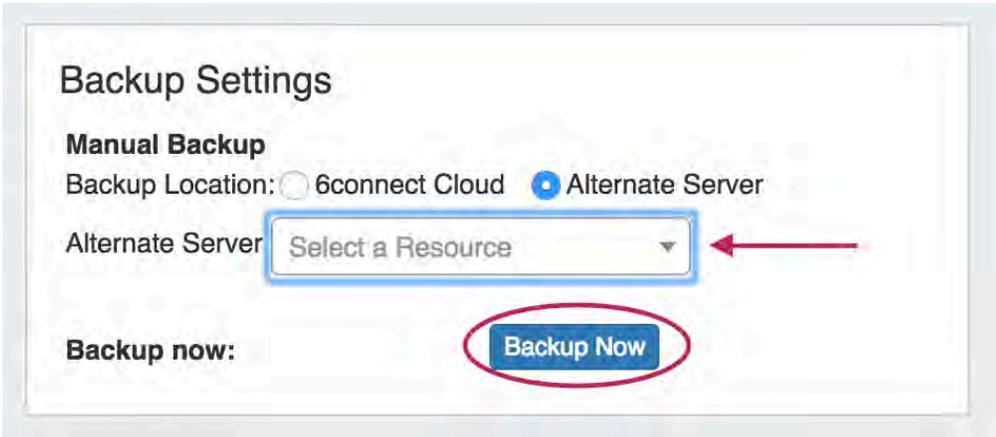

Manual Backup - 6connect Cloud:

Select "6connect Cloud" as your backup location, then click on the "Backup Now" button. You will see a success message below the button if successful.

Manual Backup - Alternate Server:

Select "Alternate Server" as your backup location, then select a server Resource that exists in ProVision to send the backup. After selecting your server, click on the "Backup Now" Button.

If selecting a server Resource in ProVision for the backup, verify that the server fields Hostname, Username, and Password are filled in and correct.

Backup Settings - Local Installation

Additional settings are available for local installations:

Remote Log Facility (syslog only)

Remote Log IP: Target IP address that we will send log information to

Remote Log Port: Port number for the syslog server you will send log information to

Remote Log Method: Select TCP, UDP, SSL from the dropdown for the log delivery method

Remote Log Backup IP: Target IP address for the Backup syslog server you will send log information to

Remote Log Backup Port: Port number for the Backup syslog server you will send log information to

Remote Log Backup Method: Select TCP, UDP, SSL from the dropdown for the log delivery method

Remote Log Type: Select SysLog format or JSON output

Remote Log Facility: Select the Facility - applies to syslog only

Authentication Options

Authentication Options

Maximum Session Idle (minutes) This value controls how long a session can stay idle before being forced to log in again.

RADIUS functions are available.

Radius Enable

Radius Server Address

Radius Authentication Port

Radius Accounting Port

Radius Key

The Radius key is the Radius Server Secret.

Radius servers must be configured with the 6connect dictionary, located [here](#).

LDAP functions are available.

LDAP Enable

LDAP Server Address

LDAP Port

LDAP Security

LDAP Auth DN List

LDAP Fetch DN

LDAP Group Attribute

The DN strings used to first authenticate the 6connect user and then to retrieve their permissions.

The string '%LOGIN%' should be inserted in place of the user's common name in both strings.

ex: cn=%LOGIN%,ou=people,dc=6connect,dc=com

Each Auth DN string will be tried in order until a user successfully authenticates.

LDAP servers must either be configured with the 6connect schema, located [here](#), or have an internal list of user groups defined by the LDAP Group Attribute above. If a Group Attribute is set it will be used. If no Group Attribute is present the 6connect schema will be used. If both fail then users will not be able to log in to ProVision.

Maximum Session Idle: This setting (minutes) controls how long a session can stay idle before being forced to log in again.

RADIUS authentication options (local install only)

Note: For implementation details, [go here](#).

Radius Enable: Check this box to enable RADIUS functionality.

Radius Server Address: Set to the IP address of your radius server. If this is specified, it will force authentication over radius.

Radius Authentication Port: Set to the port for authentication. Default port is 1812

Radius Accounting Port: Set to the port for radius accounting. Default port is 1813

Radius Key: Set to the shared key of your radius server

LDAP authentication

Note: For implementation details, [go here](#).

LDAP Enable: check the box to enable LDAP functionality.

LDAP Server Address: Set the IP address of your LDAP server.

LDAP Port: Set the port for your LDAP server

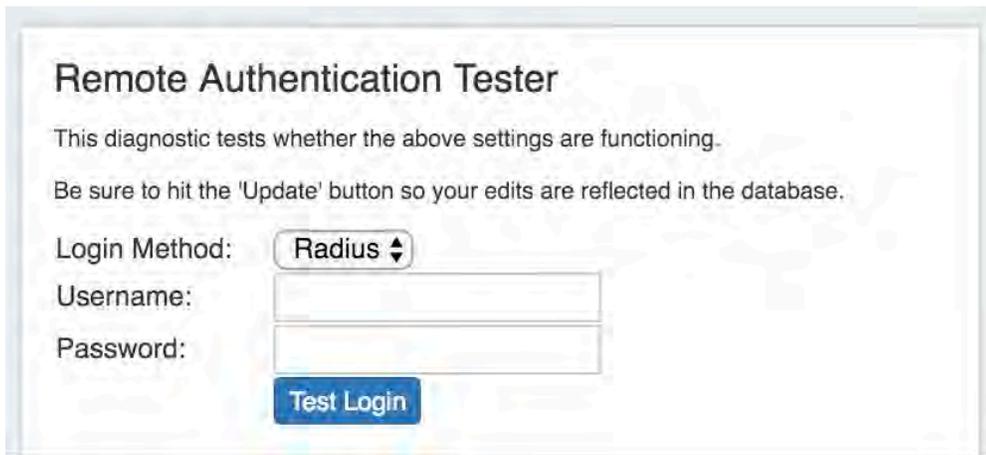

LDAP Security: Select the security method of your LDAP server - SSL, TLS or None

LDAP Auth DN/Fetch DN: These strings are used to first authentication the 6connect user and then to retrieve their permissions. The string '%LOGIN%' should be inserted in place of the user's common name both strings. (ex: cn=%LOGIN%,ou=people,dc=6connect,dc=com)

LDAP Group Attribute: If using an internal list of user groups instead of 6connect groups, enter the attribute name for the LDAP groups here. If a Group Attribute is set, it will be used first, otherwise the 6connect schema will be used.

Mapping Permissions to 6connect schema: To integrate 6connect permissions with your existing directory structure then you will need the 6connect schema. It should snap in with any existing LDAP structure and allow you to assign 6connect permissions to your existing users. You can download a copy of the schema from this section.

Remote Authentication Tester

The screenshot shows a web interface titled "Remote Authentication Tester". Below the title, there is a paragraph: "This diagnostic tests whether the above settings are functioning." followed by another paragraph: "Be sure to hit the 'Update' button so your edits are reflected in the database." The form contains three input fields: "Login Method:" with a dropdown menu showing "Radius", "Username:" with a text input field, and "Password:" with a text input field. Below these fields is a blue button labeled "Test Login".

The Remote Authentication Tester checks Radius / LDAP settings for a user.

Select the Login Method (Radius or LDAP), enter the Username and Password for the user, and then click "Test Login".

Login Method: Select Radius or LDAP, according to your authentication settings.

Username: The username for the user you are testing.

Password: Password for the user you are testing.

Templates

Email Templates

Customer Notification

Our Provisioning Department will be in touch with the specific information 5 days prior to your turn-up on the Network Information Sheet. If you are not certain of that date, please contact your Account Executive.

Thank you,
IP Analyst

Customer Notification (existing)

Gateway:
Usable IPs: xxx.xxx.xxx.xxx - xxx.xxx.xxx.xxx
Netmask: 255.255.255.xxx

These IPs are active and ready for your use.

Please contact our Hostmaster Team via if you wish to set up reverse DNS information for these new addresses.

Update

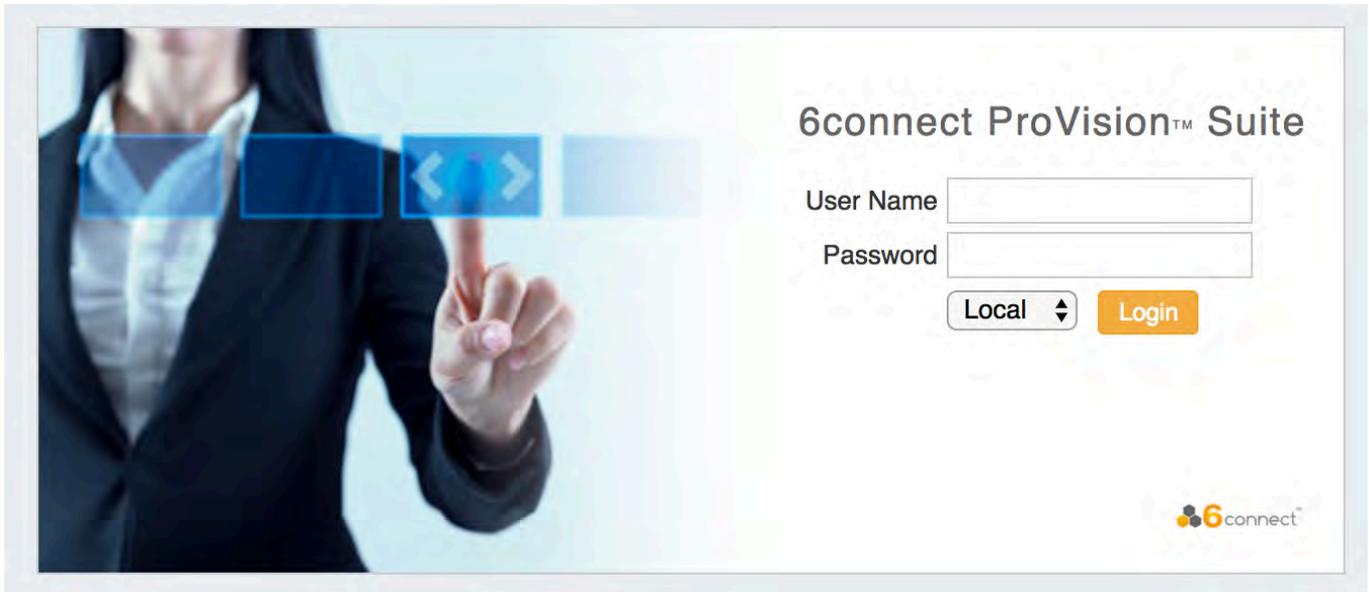

This is where you can edit outgoing email templates for IP block assignments.

To edit, click inside the text area box, make the desired changes, then click the "Update" button.

After making changes to settings, clicking any "Update" button will save your changes for all sections of the page, not just the section the update button is contained in.

Authentication Options

Authentication

Depending on the authentication method chosen by your organization, there may be a separate authentication to login or logout of the application via the drop down menu.

Change Order of Login Menu Dropdown

The drop down menu defaults to "local" - if you are using another authentication method, you can use the following to change the default ordering and improve usability.

In the file data/globals.php, add a line:

```
define('DEFAULT_LOGIN_TYPE', 'ldap');
```

Acceptable values instead of 'ldap' are 'local', 'radius' and 'ldap'.

By default, credentials are managed via the local authentication mechanism provided by 6connect. See the following sections for more detail authentication configurations:

- [LDAP Authentication](#)
- [LDAP Authentication on Windows Server](#)
- [RADIUS Authentication](#)

LDAP Authentication

LDAP Authentication

To setup an LDAP server for authentication, you must perform the following three procedures:

- LDAP Authentication
 - Configure the LDAP Server:
 - LDAP Schema - Example
 - Creating a LDAP User:
 - Test the LDAP Server
 - Configure ProVision for LDAP Authentication

Configure the LDAP Server:

Configuring the LDAP server involves ((adding the schema)) and adding LDAP users / groups to the server:

LDAP Schema - Example

```
attributetype (1.3.6.1.4.1.5023215.2.3.21 NAME 'sixConnGroup' SYNTAX
1.3.6.1.4.1.1466.115.121.1.15 ) objectclass ( 1.3.6.1.4.1.5023215.2.4.2 NAME
'sixConnectPermissionsV2' DESC '6Connect Permissions Object v2' SUP top AUXILIARY MUST (
sixConnGroup ) )
```

Creating a LDAP User:

SSH into your openLDAP server and create a new 'ldif' file. Example:

```
dn: cn=JoeSmith,ou=people,dc=6connect,dc=com
cn: JoeSmith
sn: JoeSmith
objectclass: top
objectclass: person
objectclass: sixConnectPermissionsV2
sixConnGroup: "Global Admins"
sixConnGroup: "IT Engineering"
sixConnGroup: "Sales"
sixConnGroup: "Customer Admin"
userPassword: testpass
```

To create a new user, make a new ldif file and change all instances of "JoeSmith" to whatever username you wish to create and update the password. Keep all of the object class definitions as listed above. Add a sixConnGroup declaration for each ProVision user group a user is in.

After the file is created, run the following command to add the new user to LDAP server:

```
ldapadd -h [SERVER] -x -f [LDIF FILE] -D [ROOTDN] -w [ROOT PW] -v
```

Example:

```
ldapadd -h localhost -x -f 6connect.ldif -D "cn=Manager,dc=6connect,dc=com" -w secret -v
```

The user will now be active in openLDAP and can be used to login to ProVision.

Test the LDAP Server

To query the LDAP server, run the following command on any server which has openLDAP enabled:

```
ldapsearch -b [BASE] -h [IPADDRESS] -D [DOMAIN] -w [PASSWORD] [USER]
```

Note: We have not been able to use a v6 address at with this tool, even though multiple sources say it should work.

At the end of the command where [USER] is specified, user or groups can be used (in LDAP format) to query.

Example:

```
ldapsearch -b "dc=6connect,dc=com" -h 50.240.195.129 -D  
"cn=Mayor,ou=people,dc=6connect,dc=com" -w testpass "cn=MajorMiner"
```

Configure ProVision for LDAP Authentication

To configure the use of LDAP authentication with ProVision, follow the steps below.

- Log into 6connect ProVision
- Go to Admin -> General Settings -> Authentication
- Click the LDAP Enable checkbox.
- Fill in the hostname or ip address, authentication port, LDAP Security, Auth DN, and Fetch DN.

Authentication Options

Maximum Session Idle (minutes) This value controls how long a session can stay idle before being forced to log in again.

RADIUS functions are available.

Radius Enable

Radius Server Address

Radius Authentication Port

Radius Accounting Port

Radius Key

The Radius key is the Radius Server Secret.

Radius servers must be configured with the 6connect dictionary, located [here](#).

LDAP functions are available.

LDAP Enable

LDAP Server Address

LDAP Port

LDAP Security [Test Server](#)

LDAP Auth DN List

LDAP Fetch DN

The DN strings used to first authenticate the 6connect user and then to retrieve their permissions.

The string '%LOGIN%' should be inserted in place of the user's common name in both strings.

ex: cn=%LOGIN%,ou=people,dc=6connect,dc=com

Each Auth DN string will be tried in order until a user successfully authenticates.

LDAP servers must be configured with the 6connect schema, located [here](#).

[Update](#)

Example values in this case would be:

LDAP Enable: (Checked)

LDAP Server Address: 52.240.195.12

LDAP Port: 389 (or SSL/TLS port is 636)

LDAP Security: None

LDAP Auth DN: cn=%LOGIN%,ou=people,dc=6connect,dc=com

LDAP Fetch DN: cn=%LOGIN%

Setting default login authentication options

In the login screen, you would select the authentication method from the dropdown. If you like, you can set the default login option in the following way:

Go to the /data/globals.php and open in vi (or other editor). Add in the following text as the last line of the file (before the closing ?>)

```
define('DEFAULT_LOGIN_TYPE', 'radius');
```

Acceptable values are "local", "radius" and "ldap". If this line is not present in globals.php, the default option is "local".

Using SSL encryption

To use SSL encryption with LDAP, the ldap.conf file must be correctly configured on the ProVision server.

Typically, the LDAP configuration file is kept at "/etc/ldap/ldap.conf". Make sure the following line is present:

```
TLS_REQCERT allow
```

and restart the webserver.

LDAP Authentication on Windows Server

LDAP Authentication on Windows Server

Starting in 3.6, ProVision supports LDAP authentication (including Windows Server!). To setup an LDAP server for authentication, you must perform the following procedures:

- LDAP Authentication on Windows Server
 - Configuring the LDAP functions on your Windows Server
 - LDAP Schema - Example
 - LDAP User Example
 - Test the LDAP Server
 - Configure ProVision for LDAP Authentication

Configuring the LDAP functions on your Windows Server

You should confirm these steps with your LDAP admin - the purpose of this walkthrough is to provide some level of detail on how to extend LDAP functionality to support integration with an application like ProVision.

Step 1: Prepare to extend the Schema (<http://technet.microsoft.com/en-us/library/cc961754.aspx>)

This is not a minor operation and requires interaction with various control modification areas of Windows Server:

- If you have not modified the schema before, you will need to use the Active Directory Schema console on a DC (Domain Controller) to permit write access to the DC schema.
- Since the schema object has dedicated permissions, admins must be a member of the Schema Administrator group (Schema Admins).
- Note that the DC that is holding the Schema Master Role is the only one allowed to write to it.

Step 2: Decide on method for Installing/executing Schema Extensions (<http://technet.microsoft.com/en-us/library/cc961742.aspx>)

If you have already used other AD integrations, this should be straightforward. We recommend using the LDIF script method

Step 3: Add and Modify a Schema Object (<http://technet.microsoft.com/en-us/library/cc961575.aspx>)

To add a new attribute to the schema, you first have to create a attribute object. The you will need to complete the following steps:

- Select a name for the attribute (ProVision assumes that the name will be **'sixConnGroup'**)
- Get a valid Object Identifier (OID) from an issuing authority (<http://msdn.microsoft.com/en-us/library/ms677620.aspx>)

Generate an Object Identifier

Microsoft has released a script that can generate an Object Identifier (OID):

<https://gallery.technet.microsoft.com/scriptcenter/56b78004-40d0-41cf-b95e-6e795b2e8a06>

- Document the attribute syntax
- Confirm that the attribute should be single-value
- Confirm the attribute indexing behavior
- Decide if the attribute needs to be distributed to the Global Catalog

LDAP Schema - Example

```
attributetype (1.3.6.1.4.1.5023215.2.3.21 NAME 'sixConnGroup' SYNTAX
1.3.6.1.4.1.1466.115.121.1.15 ) objectclass ( 1.3.6.1.4.1.5023215.2.4.2 NAME
'sixConnectPermissionsV2' DESC '6Connect Permissions Object v2' SUP top AUXILIARY MUST (
sixConnGroup ) )
```

LDAP User Example

SSH into your openLDAP server and create a new 'ldif' file. Example:

```
dn: cn=JoeSmith,ou=people,dc=6connect,dc=com
cn: JoeSmith
sn: JoeSmith
objectclass: top
objectclass: person
objectclass: sixConnectPermissionsV2
sixConnGroup: "Global Admins"
sixConnGroup: "IT Engineering"
sixConnGroup: "Sales"
sixConnGroup: "Customer Admin"
userPassword: testpass
```

To create a new user, make a new ldif file and change all instances of "JoeSmith" to whatever username you wish to create and update the password. Keep all of the object class definitions as listed above. Add a sixConnGroup declaration for each ProVision user group a user is in.

After the file is created, run the following command to add the new user to LDAP server:

```
ldapadd -h [SERVER] -x -f [LDIF FILE] -D [ROOTDN] -w [ROOT PW] -v
```

Example:

```
ldapadd -h localhost -x -f 6connect.ldif -D "cn=Manager,dc=6connect,dc=com" -w secret -v
```

The user will now be active in openLDAP and can be used to login to ProVision.

Test the LDAP Server

To query the LDAP server, run the following command on any server which has openLDAP enabled:

```
ldapsearch -b [BASE] -h [IPADDRESS] -D [DOMAIN] -w [PASSWORD] [USER]
```

Note: We have not been able to use a v6 address at with this tool, even though multiple sources say it should work.

At the end of the command where [USER] is specified, user or groups can be used (in LDAP format) to query.

Example:

```
ldapsearch -b "dc=6connect,dc=com" -h 50.240.195.129 -D
"cn=Mayor,ou=people,dc=6connect,dc=com" -w testpass "cn=MajorMiner"
```

Configure ProVision for LDAP Authentication

To configure the use of LDAP authentication with ProVision, follow the steps below.

- Log into 6connect ProVision
- Go to Admin -> General Settings -> Authentication
- Click the LDAP Enable checkbox.
- Fill in the hostname or ip address, authentication port, LDAP Security, Auth DN, and Fetch DN.

Authentication Options

Maximum Session Idle (minutes) This value controls how long a session can stay idle before being forced to log in again.

RADIUS functions are available.

Radius Enable

Radius Server Address

Radius Authentication Port

Radius Accounting Port

Radius Key

The Radius key is the Radius Server Secret.

Radius servers must be configured with the 6connect dictionary, located [here](#).

LDAP functions are available.

LDAP Enable

LDAP Server Address

LDAP Port

LDAP Security

LDAP Auth DN List

LDAP Fetch DN

The DN strings used to first authenticate the 6connect user and then to retrieve their permissions.

The string '%LOGIN%' should be inserted in place of the user's common name in both strings.

ex: cn=%LOGIN%,ou=people,dc=6connect,dc=com

Each Auth DN string will be tried in order until a user successfully authenticates.

LDAP servers must be configured with the 6connect schema, located [here](#).

Example values in this case would be:

LDAP Enable: (Checked)

LDAP Server Address: 52.240.195.12

LDAP Port: 389 (or SSL/TLS port is 636)

LDAP Security: None

LDAP Auth DN: cn=%LOGIN%,ou=people,dc=6connect,dc=com

LDAP Fetch DN: cn=%LOGIN%

Setting default login authentication options

In the login screen, you would select the authentication method from the dropdown. If you like, you can set the default login option in the following way:

Go to the /data/globals.php and open in vi (or other editor). Add in the following text as the last line of the file (before the closing ?>)

```
define('DEFAULT_LOGIN_TYPE', 'radius');
```

Acceptable values are "local", "radius" and "ldap". If this line is not present in globals.php, the default option is "local".

Using SSL encryption

To use SSL encryption with LDAP, the ldap.conf file must be correctly configured on the ProVision server.

Typically, the LDAP configuration file is kept at "/etc/ldap/ldap.conf". Make sure the following line is present:

```
TLS_REQCERT allow
```

and restart the webserver.

RADIUS Authentication

RADIUS Authentication

ProVision supports 6connect vendor-specific attributes (VSAs) for use with RADIUS authentication. To use these attributes, you must perform the following procedures:

- RADIUS Authentication
 - Add the 6connect VSA to the Radius Installation
 - Configure Radius Accounts
 - Test Radius Accounts
 - Configure ProVision for Radius Authentication

Add the 6connect VSA to the Radius Installation

To use the 6connect VSA, the attributes must be defined on the RADIUS server. Add the following RADIUS dictionary file to your RADIUS server and name it dictionary.6connect:

ProVision 4.0 and greater:

```
VENDOR 6connect 36009

BEGIN-VENDOR 6connect

ATTRIBUTE 6connect_user_group 10 string
#A 6connect User Group to which this user belongs.

END-VENDOR 6connect
```

Make sure to add the following to the primary dictionary file: `$INCLUDE dictionary.6connect`

Configure Radius Accounts

On the Radius server, configure the user accounts that will have access to the ProVision system.

An example of a ProVision account configuration for the user file on a Freeradius system for ProVision 4.0 and greater:

Example: To add a new radius user, edit the 'users' file found at `/etc/raddb/users` and add a block like:

Setting up a RADIUS account

```
bobber Cleartext-Password := "hello"
6connect_user_group = "Global Admins,Group 2,Group 1,Group Nonexistent"
```

The Radius server must be restarted every time you add, remove, or modify users. To restart the Radius server, use this command:

```
/etc/init.d/radiusd restart
```

Note on RADIUS attributes

There are many Radius attributes, but '6connect_user_group' is the one used by 6connect ProVision. It is a comma-separated list of all the group names that the user belongs to.

Test Radius Accounts

For ProVision 4.0 and higher, test and response should look like the following:

To query a radius server, use the following command format:

```
radtest [USERNAME] [USERPASSWORD] [SERVER] 0 [SECRET]
```

Example:

```
radtest bobber hello 208.39.140.106 0 6connect
```

A successful response will look like this:

```
Sending Access-Request of id 198 to 208.39.140.106 port 1812
User-Name = "bobber"
User-Password = "hello"
NAS-IP-Address = 67.221.240.229
NAS-Port = 0
Message-Authenticator = 0x00000000000000000000000000000000
rad_recv: Access-Accept packet from host 208.39.104.106 port 1812, id=198, length=69
Attr-10 =
0x476c6f62616c2041646d696e732c47726f757020322c47726f757020312c47726f7570204e6f6e6578697374
```

A rejected response may look like this:

```
Sending Access-Request of id 68 to 208.39.140.106 port 1812
User-Name = "bobberbro"
User-Password = "hello"
NAS-IP-Address = 67.221.240.229
NAS-Port = 0
Message-Authenticator = 0x00000000000000000000000000000000
rad_recv: Access-Reject packet from host 208.39.104.106 port 1812, id=68, length=20
```

Configure ProVision for Radius Authentication

To configure the use of Radius authentication with ProVision, follow the steps below.

- Log into 6connect ProVision
- Go to Admin -> Authentication
- Ensure that Radius functions are marked as available. Radius functions are always available on 6connect cloud instances. Radius functions are available on VM Images and Local Installations only if the relevant PHP Pear Radius Libraries have been installed.

Authentication Options

Maximum Session Idle (minutes) This value controls how long a session can stay idle before being forced to log in again.

RADIUS functions are available.

Radius Enable

Radius Server Address

Radius Authentication Port

Radius Accounting Port

Radius Key

The Radius key is the Radius Server Secret.

Radius servers must be configured with the 6connect dictionary, located [here](#).

- Click the Radius Enable checkbox.
- Fill in the hostname or ip address, authentication ports, accounting port, and shared Radius key as specified.

Setting default login options

In the login screen, you would select the authentication method from the dropdown. If you like, you can set the default login option in the following way:

Go to the /data/globals.php and open in vi (or other editor). Add in the following text as the last line of the file (before the closing ?>)

```
define('DEFAULT_LOGIN_TYPE', 'radius');
```

Acceptable values are "local", "radius" and "ldap". If this line is not present in globals.php, the default option is "local".

IPAM Administration

Overview

The screenshot shows the IPAM Administration interface. At the top, there is a navigation bar with the following items: IPAM Admin, VLAN Admin, Data Import, Users, API, Scheduler, and Exit Admin. A search bar is located on the right side of the navigation bar. Below the navigation bar, the main content area is divided into four sections:

- IPAM Lists Management:**
 - Edit IPAM Tags
 - Edit IPAM Regions
 - Edit IPv4 Subnets Dropdown
 - Edit IPv6 Subnets Dropdown
 - Edit IPAM Rules
- Holding Tank Management:**
 - Process Holding Tank now (Set to 0 days)
- LIR Management:**
 - Add/Edit/Update LIRs
- Configuration Management:**
 - IPAM Configuration

IPAM Administration is accessed through the Admin area of ProVision. It includes sections to manage IPAM Lists, the Holding Tank, LIR, and IPAM Configuration.

- Overview
 - IPAM Lists Management
 - IPAM Configuration
 - Holding Tank Management
 - LIR Management and Use

IPAM Lists Management

These links are to the respective [IPAM Parameters](#) that are available for customization - tags, regions, subnets, and IPAM Rules. Go to the [IPAM Parameters](#) page for more details and examples for customization, and [IPAM Rules](#) for additional information on managing IPAM Rules.

IPAM Configuration

The screenshot shows the IPAM Configuration page. The settings are as follows:

Setting	Value
Holding Tank Days	0
IPv4 Block Scanner Enable	<input checked="" type="checkbox"/>
IPv4 Block Scanner Max Block Size	/24
Regions Enable	<input checked="" type="checkbox"/>
Region Display Text	Region
Generic Code Per Block Enable	<input checked="" type="checkbox"/>
Generic Code Per Block Display	<input checked="" type="checkbox"/>
Generic Code Per Block Name	GRT
RIPE Database	<input type="radio"/> RIPE <input checked="" type="radio"/> TEST
Show /32 or /128 mask for statics	<input checked="" type="checkbox"/>
Merge after unassign	<input checked="" type="checkbox"/>
Enable Map View	<input checked="" type="checkbox"/>
Default Tag Selection Mode	<input checked="" type="radio"/> Standard <input type="radio"/> Strict <input type="radio"/> Exclude

When enabled, ProVision will merge unassigned blocks into the largest possible block within an aggregate

[Update](#) [Back To IPAM Admin](#)

Holding Tank Days: This is the number of days that a block will be held in "Holding" status before being available to be moved to the Available

pool, and thus ready to be assigned. By default this is initially set to 30 days.

IPv4 Block Scanner Enable: This is a beta feature that allows a user to scan a block of IPv4 space and show host counts of responding addresses.

IPv4 Block Scanner Max Block Size: The max size (mask) the IPv4 Block Scanner considers.

Regions Enable: Check the box to enable "Region" tags for IP blocks. This will add a "Region" column to the IPAM Manage screen. Values may be set from "Edit IPAM Regions" under IPAM Admin - IPAM Lists Management.

Regions Display Text: This is the label that will be displayed for the Regions field.

Generic Code Per Block Enable: Check this box to enable this function. This will enable an additional custom field per IP Block.

Generic Code Per Block Display: Check this box to display this custom field.

Generic Code Per Block Name: This is the label that will be displayed for the Generic Code field.

RIPE Database: Select the desired database

Show /32 or /128 mask for statics: Enable to show /32 or /128 masks.

Merge after unassign: Select to automatically merge adjacent blocks when they become available after unassign.

Enable Map View: Select to enable a map view of assigned aggregates on the IPAM tab, determined by assigned region.

Default Tag Selection Mode: Set which radio button will be selected by default when working with tags in the IPAM Gadget

Holding Tank Management

When IPv4/IPv6 resources are reclaimed, they are placed into the "Holding Tank". This feature allows for a block to stay out of the available address pools until the administrator approves it. Go to the [Holding Tank Management](#) page for more details.

LIR Management and Use

ProVision supports multiple LIRs from the UI. This allows users to select from various LIRs when they want to update SWIP/RPSL information for a subnet allocation. Go to the [LIR Management and Use](#) page for more details.

Additional Information:

- [IPAM Parameters](#)
- [IPAM Rules](#)
- [Holding Tank Management](#)
- [LIR Management and Use](#)

IPAM Parameters

IPAM Parameters - Overview

IPAM Lists Management is access from the Admin section of ProVision, under the [IPAM Admin](#) tab. Through this area, admin users can update IPAM tags, regions, IPv4 subnets, and IPv6 subnets.

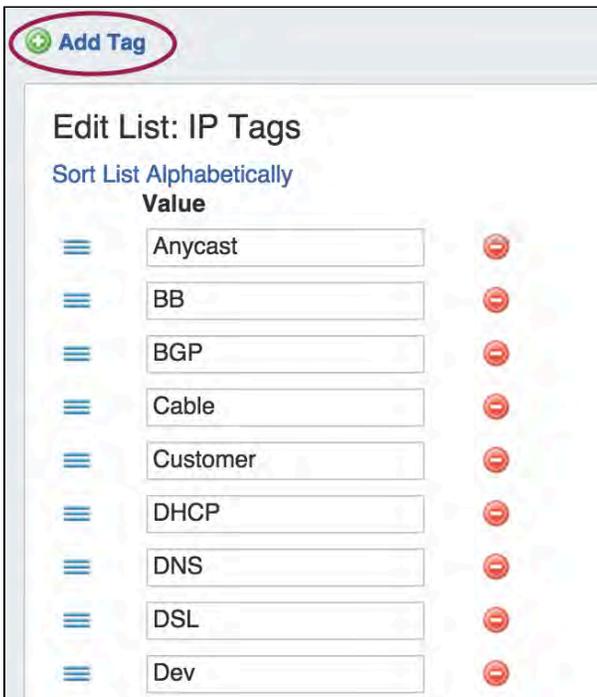

- IPAM Parameters - Overview
 - Add / Edit IPAM Tags
 - Add / Edit Regions
 - Add / Edit IPv4 / IPv6 Subnet Dropdowns
 - Edit IPAM Rules

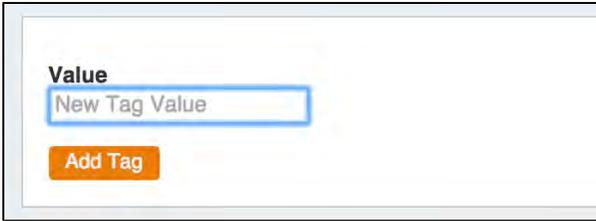

Add / Edit IPAM Tags

When you are applying properties to IP blocks, you have the option to edit tags. IPAM Tags are used in a number of areas in ProVision and can be added or edited from this screen.

To add a new IPAM tag, click on "Add Tag" at the top of the Edit IPAM Tags page.

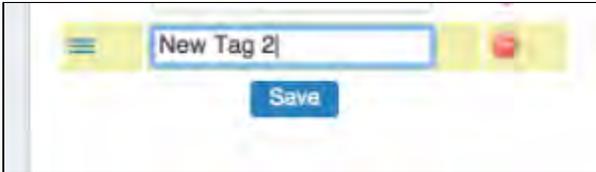

Then, type in the desired name value for the new tag, and hit "Add Tag".

A screenshot of a web form. At the top left, the word "Value" is written in bold. Below it is a text input field containing the text "New Tag Value". Below the input field is an orange button with the text "Add Tag".

To **edit** a tag, simply type your changes in to the text box with the tag name. Tags with unsaved changes will be highlighted until saved.

To **delete** a tag, click on the red "delete" symbol to the right of the tag name.

A screenshot of a web form for editing a tag. It shows a text input field containing "New Tag 2". To the right of the input field is a red circular delete icon. Below the input field is a blue button with the text "Save".

When complete, be sure to click on the "Save" button to save your changes.

Add / Edit Regions

If enabled, Regions can function as a way to further define your network segments (regional tie-downs, etc.). This gives you flexibility for allocations and assignments beyond simply using Tags. Regions are used by the [IPAM Gadget](#), the IPAM Manage UI, and IPAM Map View.

The Regions display includes fields for Value, Name, and Address. 'Name' is the region name that will show in the IPAM Gadget and IPAM Manage screens, whereas 'Value' is the value that will be written to the database, used for API calls, and is also used for some filter selectors. The Address field is used by IPAM map view to geolocate aggregates with that assigned region. Address may be in the form of a City / State / Country or a full street address. The more accurate your address information, the more accurate map view will be with your aggregate locations.

To add a new Region item, type in a new Value and Name into the empty fields at the bottom of the list.

Edit Regions list

You are editing the **Region** dropdown.

Region Code	Name	Address	Action
Cartago, Costa Rica	Cartago, Costa Rica	Cartago Province, Costa Rica	Update 
CHP	Champaign	Champaign, IL, USA	Update

[Back To IPAM Admin](#)

To **edit** a region, simply type your changes in to the text box with the region name. Then, click on the "Update" Button.

To **delete** a region, click on the red "delete" symbol to the right of the region name.

Add / Edit IPv4 / IPv6 Subnet Dropdowns

When assigning blocks using the "Smart Assign" function in the [IPAM Gadget](#), the user has an option to assign an IP resource by allocation size. ProVision supports assignments down to a single host level (/32 for IPv4, /128 for IPv6).

Note on Editing the Subnet Dropdown

Keep in mind that this is a global edit. If the values in the dropdown are changed, it will affect ALL users of the ProVision application

To add a new Subnet item, click on "Add Item" at the top of the Edit List: IPv4 or IPv6 Subnets page.

	Value	Display	
☰	20	/20	-
☰	24	/24	-

☰	32	/32	-

Save

[Back To IPAM Admin](#)

Then, type in the desired Value and Display value for the Subnet, and hit "Add Item".

Value: 22 Display: /22

Add Item

After adding a new item, it will show at the bottom of the list highlighted in yellow. Hit "Save" to save your changes.

The screenshot shows a web interface for managing IP subnets. It features a table with three rows. Each row has a menu icon on the left, a text input field for the subnet number, a text input field for the subnet mask, and a red delete icon on the right. The third row, containing '22' and '/22', is highlighted in yellow. Below the table is a blue 'Save' button and a link labeled 'Back To IPAM Admin'.

☰	<input type="text" value="31"/>	<input type="text" value="/31"/>	🗑️
☰	<input type="text" value="32"/>	<input type="text" value="/32"/>	🗑️
☰	<input type="text" value="22"/>	<input type="text" value="/22"/>	🗑️

[Save](#)

[Back To IPAM Admin](#)

To **edit** a subnet, simply type your changes in to the text box. Entries with unsaved changes will be highlighted until saved.

After adding or editing a subnet, you may wish to clean up the list order by hitting "Sort List Numerically" at the top of the page to reset the list order including the new entry.

To **delete** a subnet, click on the red "delete" symbol to the right of the subnet entry.

When complete, be sure to click on the "Save" button to save your changes.

Edit IPAM Rules

IPAM Rules allow for certain address positions within an IP Block to be reserved when utilizing Direct Assign and Smart Assign. These rulesets may be managed in the "Edit IPAM Rules" section of IPAM Admin.

For additional details, see [IPAM Rules](#).

IPAM Rules

IPAM Rules

IPAM Rules are accessed from the Admin section of ProVision, under the [IPAM Admin](#) tab by clicking on "Edit IPAM Rules".

In the IPAM Admin "Edit IPAM Rules" section, Admin users may view all existing IPAM Rules, the blocks affected by each rule, and delete rules.

- IPAM Rules
 - IPAM Rules Overview
 - IPAM Rules Behavior and Bounds:
 - Edit IPAM Rules Page
 - Add an IPAM Rule:
 - IP Rule Positions
 - Edit an IPAM Rule:
 - View Affected IP Blocks:
 - Delete an IP Rule:
 - Working with IP Rules:

IPAM Rules Overview

IPAM Rules allow users to exclude IP addresses from being assigned by Smart Assign or Direct Assign, based on the address position in the block (ie, first address, last address, nth from last).

Reserved addresses are set by their position in the block, starting with position '1' to represent the first address, '2' the second, and so on (1,2,3). The last position in the block is represented as '0', with each step backwards set as the next lowest negative integer (0, -1, -2, 3). Rulesets may reserve one or many positions in a block, so you can choose to reserve only the first address (1), only the last address (0), or combinations as desired - reserving the first three and last three addresses on a block would look like (1,2,3,0,1,-2).

IPAM Rules may be created and applied to blocks under the IPAM Tab -> IPAM Manage screen, in the Action Menu for the desired block. Additional management tasks are available under the IPAM Admin -> "Edit IPAM Rules" page.

IPAM Rules Behavior and Bounds:

- Rules may be applied to IPv4 or IPv6 blocks
- Once a rule has been applied to a block, the addresses at the selected rule positions will be bypassed when Smart Assigning from that block, or return an error when Direct Assigning that position from the IPAM Gadget.
- Only one ruleset may be applied per block - so if a rule already exists for reserving the first address in a block, and a second rule exists for reserving the last address, and you would like to use both, a third, new ruleset must be created that combines reserving both first and last.
- Rules cascade down the IP tree. If a rule is applied to a /24, child blocks under that /24 (/30s, etc) will have the same ruleset applied.
- Changing the positions in a ruleset applies that change to all blocks using that rule - ensure that changes are desired universally when updating a rule.
- If a rule's position(s) is outside of the boundary of the selected block (for example, trying to reserve the 60th address of /30), an error message will notify the user and prompt for a different rule selection.

Edit IPAM Rules Page

In the IPAM Admin "Edit IPAM Rules" section, Admin users may view all existing IPAM Rules, the blocks affected by each rule, create new rules, and delete existing rules.

Rule name	Creation date	Positions	Actions	
Reserve First	2016-10-06T19:05:26+0000	1	View Affected IP Blocks	Delete rule
Reserve Last	2016-10-06T19:05:40+0000	1	View Affected IP Blocks	Delete rule
Reserve 65th	2016-10-17T18:48:12+0000	1	View Affected IP Blocks	Delete rule
reserve third	2016-10-24T21:01:49+0000	1	View Affected IP Blocks	Delete rule

Add New Rule: Opens the "Manage Ruleset" interface where a new rule may be created. This module is also accessible from the "IP Rules" option on the IPAM Manage Action Menu.

Search: Filter the list of rules by searching for a rule name.

Rule Name: The user-created name of the rule. **Clicking** on the rule name will bring up the Manage Ruleset screen, showing an editable list of rule positions.

Creation Date: Date the rule was created.

Positions: How many positions are reserved by the rule.

View Applied Networks: Shows a list of blocks that have the rule applied.

Delete Rule: Deletes the selected rule.

Add an IPAM Rule:

Adding an IPAM Rule from the Admin area of ProVision functions the same way as if accessed from IPAM Manage.

Click on "Add new Rule", and the Manage Ruleset screen will appear, prompting you to enter a Ruleset name, and select positions to reserve.

? Unknown Attachment

IP Rule Positions

Reserved addresses are set by their position in the block. Positions start at '1', for the first address in a block, and step up by one for each subsequent IP address. The last position in a block is '0', representing the last address, and steps down a negative integer for each position from last - so the last three addresses in a block would be represented by (0, -1, -2). When reserving multiple positions, the typed order of the positions does not matter.

Position examples:

(1) - Reserves the first IP

(0) - Reserves the last IP

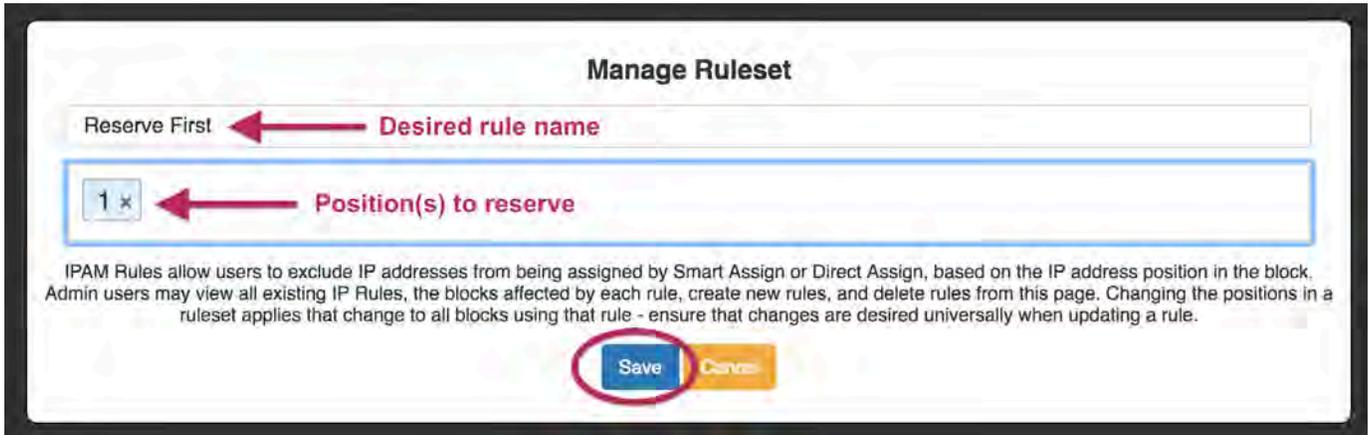

(1,2,3) - Reserves the first three IPs

(0, -1, -2) - Reserves the last three IPs.

(1,2,3,0,-1,-2) - Reserves the first three and last three IPs

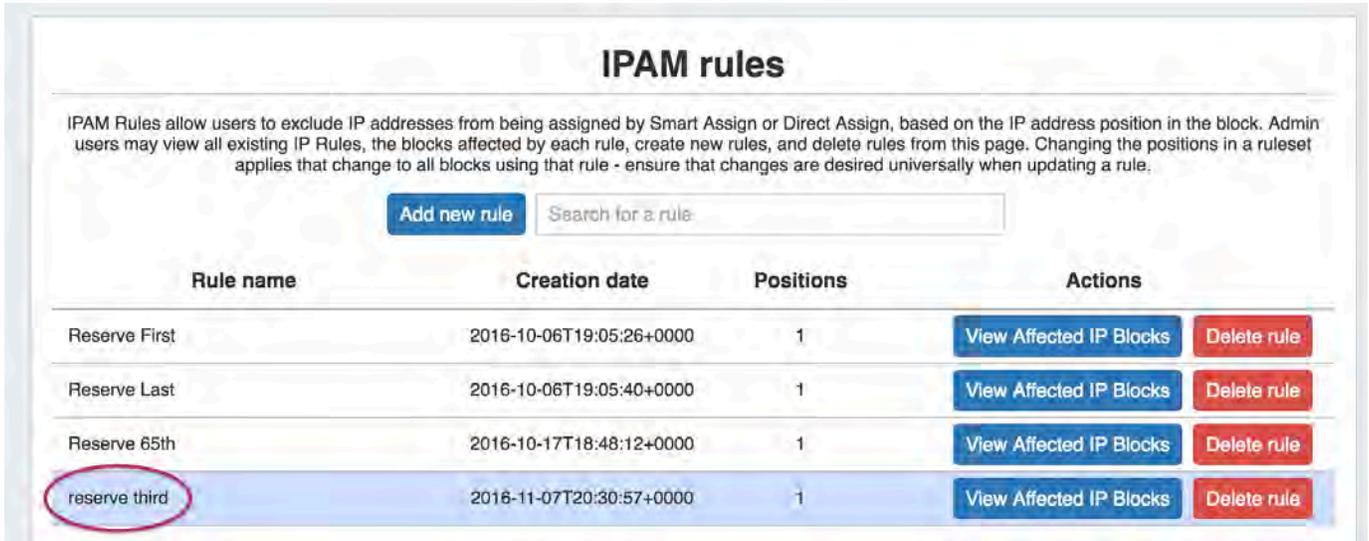

Type in the desired name for the new rule, and one or multiple positions (denoted by integers separated by commas) into the box below the name.

When complete, click the "Save" button, or hit "Cancel" to exit without saving. The Rule preview screen will appear.

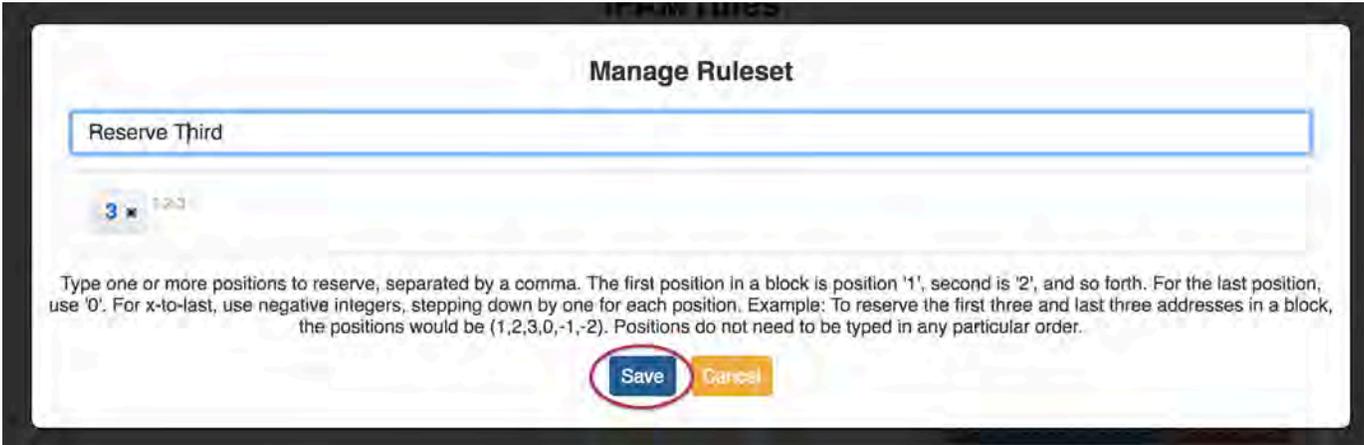

Edit an IPAM Rule:

From the Admin IPAM Rules page, click on the Rule entry in the list when highlighted.

This will bring up the "Manage Ruleset" module, showing the rule name and the currently reserved positions for the ruleset.

To change the rule name, simply type the desired changes into the Rule Name text box, and click "Save".

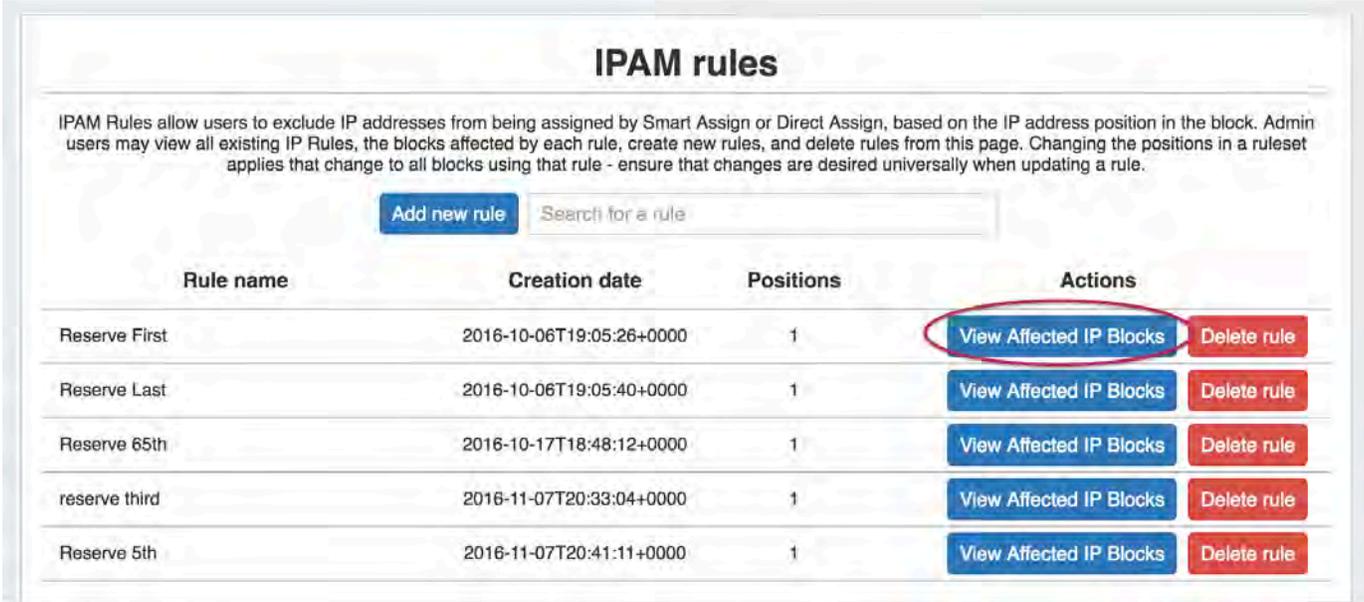

To edit the positions in the rule, either delete a position by clicking on the "x" for the position, or add a new position by typing the position number and then hit enter.

When you are done with your changes, click the "Save" button.

To discard changes, or exit the module, click "Cancel".

Note: When positions are changed, the change applies to all blocks using that rule! Ensure that the change is desired universally for all blocks using that rule prior to updating.

View Affected IP Blocks:

Clicking on "View Affected IP Blocks" in the IP Rules list for a rule will show a list of blocks that currently have the rule applied. It is recommended that you check the affected blocks list before editing or deleting an IP Rule to ensure that the changes are desired for the affected blocks.

Delete an IP Rule:

To delete an IP Rule, click on the "Delete Rule" button for the rule in the IPAM Rules list. This will permanently delete the rule and remove it from any blocks currently affected by the rule.

If you only wish to remove a rule from a block, but retain the rule for future use (or to retain use by other blocks), please see "Remove a rule from a block" detailed at [Working with IP Rules](#).

IPAM rules

IPAM Rules allow users to exclude IP addresses from being assigned by Smart Assign or Direct Assign, based on the IP address position in the block. Admin users may view all existing IP Rules, the blocks affected by each rule, create new rules, and delete rules from this page. Changing the positions in a ruleset applies that change to all blocks using that rule - ensure that changes are desired universally when updating a rule.

[Add new rule](#)

Rule name	Creation date	Positions	Actions	
Reserve First	2016-10-06T19:05:26+0000	1	View Affected IP Blocks	Delete rule
Reserve Last	2016-10-06T19:05:40+0000	1	View Affected IP Blocks	Delete rule
Reserve 65th	2016-10-17T18:48:12+0000	1	View Affected IP Blocks	Delete rule
reserve third	2016-11-07T20:33:04+0000	1	View Affected IP Blocks	Delete rule
Reserve 5th	2016-11-07T20:41:11+0000	1	View Affected IP Blocks	Delete rule

Working with IP Rules:

For additional information on common IP Rules tasks that do not require Admin access, see [Working with IP Rules](#) in the ProVision User Guide.

Detailed walkthroughs of creating a new rule, applying an existing rule to a block, and removing a rule from a block are provided.

Holding Tank Management

Holding Tank Management

How it Works

The "**Process Holding Tank now**" link will move any block assigned to "Holding" to its relevant "Available" pool. This command will process **ALL** addresses assigned to "Holding" depending on their age. The default time for release to "Available" is 30 days. If a block has not been in the holding tank for that specified length of time, it will not be released using this feature (it can be released manually per record at any time) . The threshold for the number of days in the Holding Tank is set in the main [Admin Preferences](#) page and is customizable.

Process Holding Tank

5 IPv4 blocks, 0 IPv6 blocks to be removed from Holding Tank.

Block	Region	DataCenter1	Tags	VLAN	Last Updated
10.0.1.0/24	Quito		Anycast, BB		2015-03-06 11:00:05
10.5.64.0/18	Quito		Customer		2015-03-06 11:01:14
10.48.0.0/12	LAX		Anycast, Customer		2015-03-06 11:04:50
10.128.0.0/12					2015-03-06 11:01:47
10.144.0.0/12					2015-03-06 11:01:50

[Process Holding Tank](#) [Back to IPAM Admin](#)

When an administrator elects to process the Holding Tank, it will show the information above.

Pro-Tip!

If you need to do a bulk "empty" of the holding tank. Set the time for release to "0" days. This will allow you to process the holding tank for all blocks that are in the Holding Tank.

Holding Tank Permissions

For blocks with subassignments, the Holding Tank can utilize ProVision's permissions structure in order to override holding. This allows the subassigned block to be set as assigned to the parent resource.

Using this feature requires:

- 1) A block (block 1) assigned to a Resource (Resource A) that allows subassignments.
- 2) A block (block 2) subassigned to another Resource (Resource B) from the parent (block 1).
- 3) A User assigned to a Group with permissions to both Resource A and Resource B, and IPAM permissions for the 6connect Holding Resource. See [Users and Groups](#) for additional information on setting up Users and Group permissions.

Resource Permissions (Show Details)

	IPAM	DNS	Peer	Resource	User	
Resource						
Google	<input checked="" type="checkbox"/>	<input type="checkbox"/>				
Apple	<input checked="" type="checkbox"/>	<input type="checkbox"/>				
6connect holding	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Steps:

- 1) While logged in as the user with the above permissions, go to the IPAM manage screen for the subassigned block (block 2).
- 2) Select "Unassign" from the Action Menu. The 'Assigned To' column will change from showing "Resource B" to "Holding"

- 3) For the same block, select "Override Holding" from the Action Menu. This is the step that setting the 6connect Holding resource permissions allows, that would otherwise be inaccessible.
- 4) You will then see the 'Assigned To' field change from "Holding" to "Resource A", as the assignment is reverted to match the parent level.

Override Holding through the permissions structure is intended only for blocks that are subassigned. It is not intended for blocks that are not subassigned. Setting holding permissions for non-subassigned blocks simply allows viewing of the block(s) in holding, and permissions do -not- extend to allowing overrides by design.

LIR Management and Use

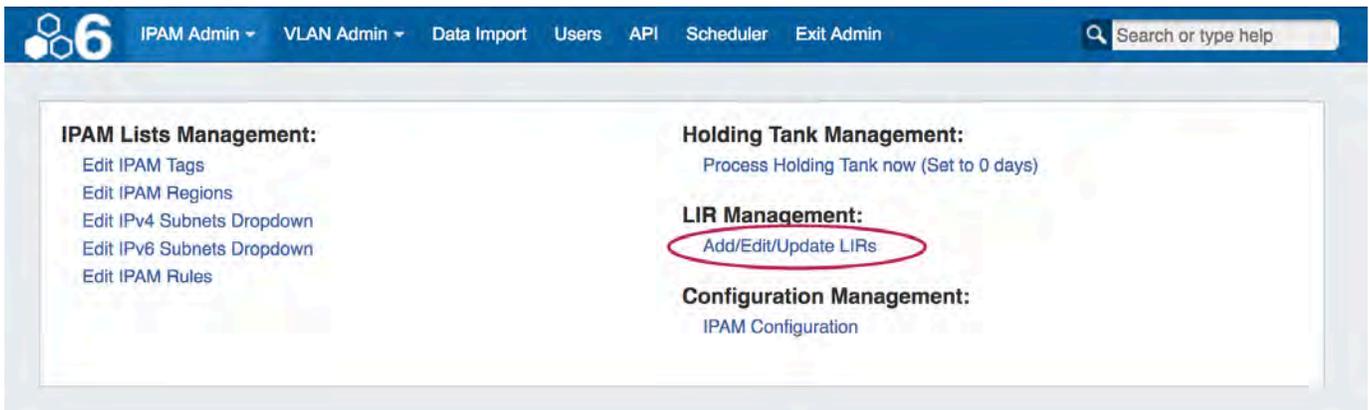

Overview

ProVision supports multiple LIRs (Local Internet Registries) in a single instance. This means that you have the ability to update SWIP/RPSL functions for a given allocation with the LIR information that you wish.

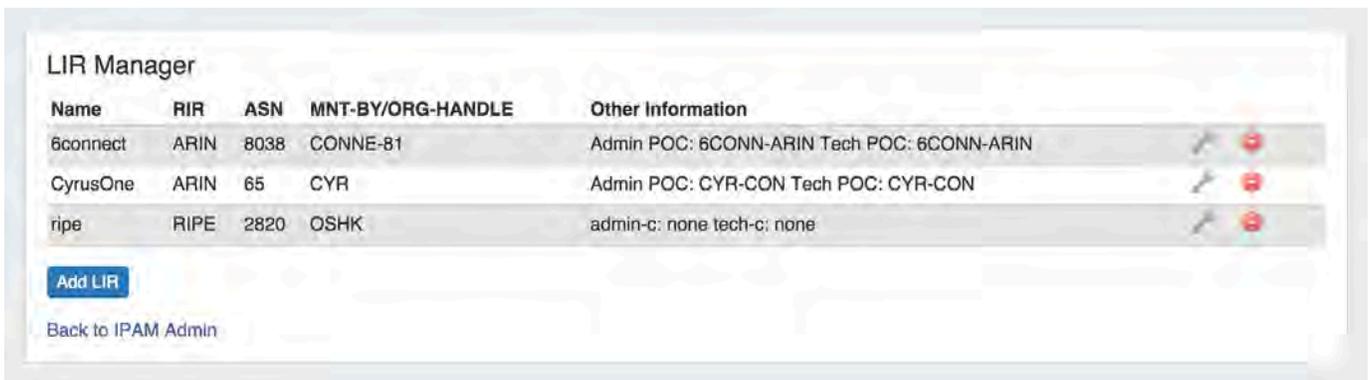

- Overview
 - LIR Setup and Use
 - Edit a LIR
 - Add a LIR
 - ARIN
 - RIPE
 - RIR Integration

LIR Setup and Use

There is an LIR Manager available from the IPAM Admin page. In the Admin section of ProVision, select the **IPAM Admin** tab, then "LIR Management: Add / Edit / Update LIRs".

You will be taken to the LIR Manager page, showing your current LIRs. You may Add LIRs, edit the existing LIRs by hitting the Action Menu (wrench icon), or delete LIRs through the red delete icon.

Edit a LIR

Edit a LIR by clicking on the Action Menu (wrench icon) next to the entry in the LIR Manager. The Update LIR dialog will open. From here, you can edit RIR, Name, ASN, and Org information, as well as add / delete Orgs.

Update LIR

RIR: ARIN

Name: 6connect

ASN: 8038

Org ID	CONNE-81	 Delete
Admin POC	6CONN-ARIN	
Tech POC	6CONN-ARIN	
Abuse POC	6CONN-ARIN	
NET Name Prefix	6CONN	
API Key	*****	

 Add Org

Update

Add a LIR

After clicking on the **Add LIR** button, you can setup the required data for the specific RIR/LIR combination:

ARIN

Adding a new LIR with ARIN selected for RIR will bring up the following fields.

Add LIR

RIR: ARIN

Name:

ASN:

Org ID: Delete

Admin POC:

Tech POC:

Abuse POC:

NET Name Prefix:

API Key:

[+ Add Org](#)

Enter the Name, ASN, ORG ID, POC information, NET Name Prefix, and API Key. Additional Orgs may be added by selecting the "Add Org" button.

Be sure to click the "Update" button when done to save your changes.

Press UPDATE to SAVE!
 Make sure to press the Update button or else the LIR data will not save.

RIPE

Adding a new LIR with RIPE selected for RIR will bring up the following fields.

Add LIR

RIR: RIPE

Name:

ASN:

Maintainer: Delete

Password:

Admin Contact:

Tech Contact:

[+ Add Maintainer](#)

Enter the Name, ASN, Maintainer, Password, and Contact information. Additional Maintainers may be added by selecting the "Add Maintainer" button.

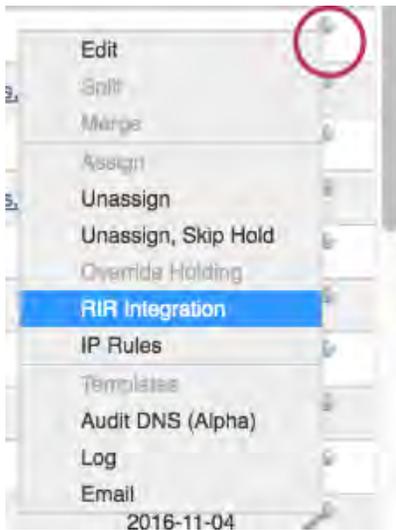

Be sure to click the "Update" button when done to save your changes.

Press UPDATE to SAVE!

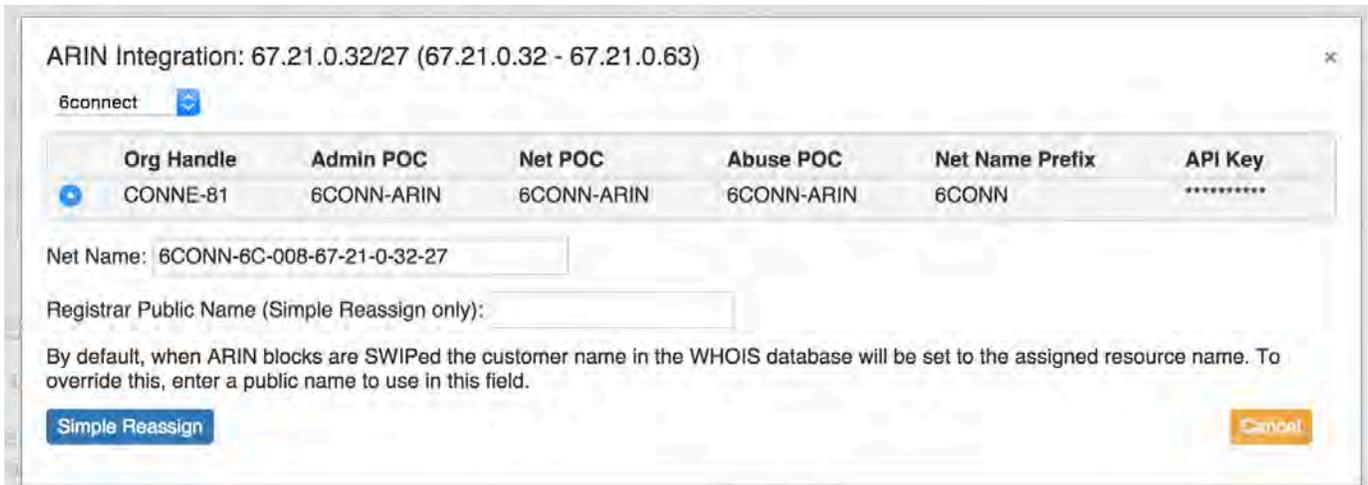

Make sure to press the Update button or else the LIR data will not save.

RIR Integration

Once these have been configured, you will be able to use the **RIR integration** feature from the Action Menu on the IPAM Manage screen or IPAM Gadget:

RIR specific options will pop up (see ARIN example below) and give the option to either "Simple Reassign" or "Cancel".

For additional detail, continue on to:

- [ARIN LIR Setup and Use](#)
- [RIPE LIR Setup and Use](#)

ARIN LIR Setup and Use

LIR Setup

- LIR Setup
 - Step 1: Setup the LIR information via the LIR Manager
 - Step 2: Assign an IP block to a Resource using the IPAM Gadget or the Assign function from the IPAM Manage screen.
 - Step 3: Update SWIP information
 - Simple Re-assign

Step 1: Setup the LIR information via the LIR Manager

You will be prompted to select the RIR

Add LIR

RIR

Name

ASN

Add in the requisite Org and POC information

Add LIR

RIR

Name

ASN

Org ID ⊖ Delete

Admin POC

Tech POC

Abuse POC

NET Name Prefix

API Key

⊕ Add Org

Update

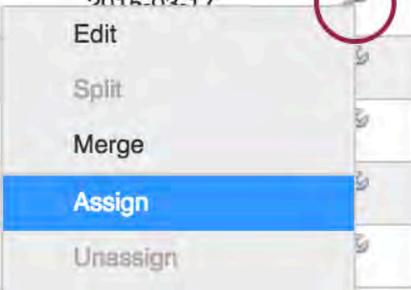

Multiple Org Support

Note that we support multiple Org Handles per ARIN entry. Simply click on the [Add Org](#) link at the bottom of the Add LIR dialog box.

Step 2: Assign an IP block to a Resource using the **IPAM Gadget** or the **Assign** function from the IPAM Manage screen.

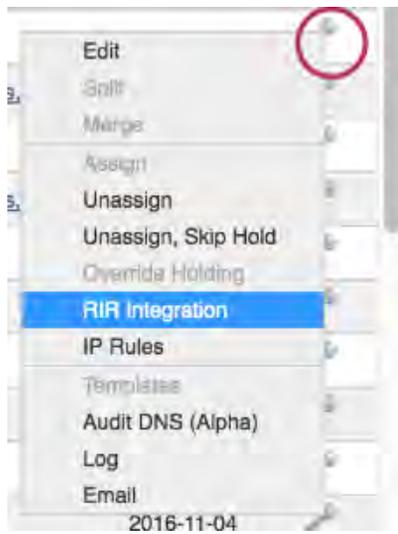

Go into IPAM Manage or the IPAM Gadget, and assign a block. See [Working with IP Blocks](#) for additional detail.

Export Current List To CSV

VLAN	Assigned To	Updated	
	6connect Labz	2015-03-17	
	6connect Labz	2015-03-17	
	6connect Labz	2015-03-17	 
	6connect Labz		
	6connect Labz →		
	6connect Labz →		
	Available		

Step 3: Update SWIP information

Select "RIR Integration" from the Action Menu in IPAM Manage.

It will bring up an RIR Integration dialog, dependent on the selected RIR (ARIN example shown):

ARIN Integration: 67.21.0.32/27 (67.21.0.32 - 67.21.0.63)

6connect

Org Handle	Admin POC	Net POC	Abuse POC	Net Name Prefix	API Key
CONNE-81	6CONN-ARIN	6CONN-ARIN	6CONN-ARIN	6CONN	*****

Net Name:

Registrar Public Name (Simple Reassign only):

By default, when ARIN blocks are SWIPed the customer name in the WHOIS database will be set to the assigned resource name. To override this, enter a public name to use in this field.

SWIP Update Functionality Details

In the case when a user already has SWIPped blocks to ARIN, 6connect checks prior to actually performing a SWIP. In the process, if the IP block is already SWIPped, it will check for existing ARIN customer data and update the 6connect data to reflect what ARIN has on file. Once that is complete, the user can then perform a de-SWIP function using ProVision.

Simple Re-assign

From ARIN.net:

Used to subdelegate IP addresses to a customer that does not need to:

- subdelegate the addresses to their own customers
- maintain their own in-addr.arpa delegation
- display their own point of contact (POC) information.

It can also be used to change the customer name and address information (but not the range) on an existing simple reassignment and to remove simple reassignments. It is submitted by an ARIN Online user account linked to the parent organization's Admin or Tech POC, or the Tech POC for the resource.

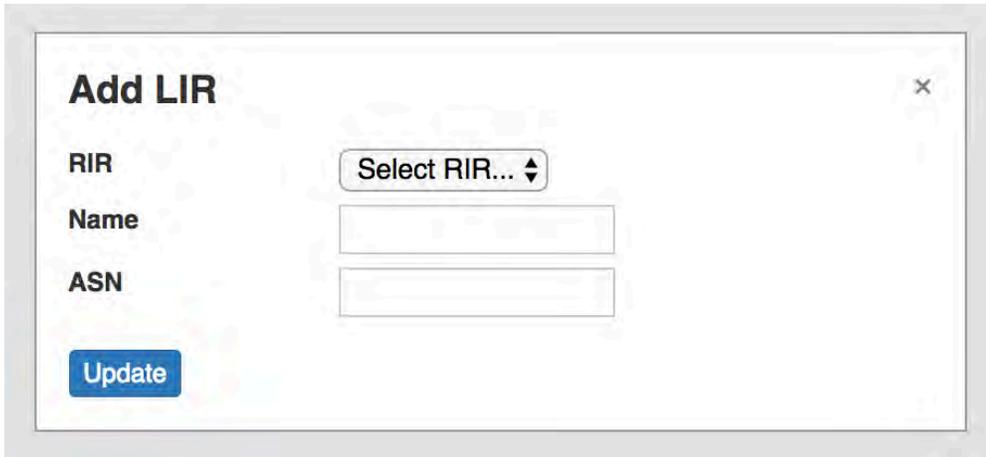

RIPE LIR Setup and Use

LIR Setup - RIPE

- LIR Setup - RIPE
 - Step 1: Setup the LIR information via the LIR Manager
 - Step 2: Assign an IP block to a Resource using the IPAM Gadget or the Assign function from the IPAM Manage screen.
 - Step 3: Update RPSL information

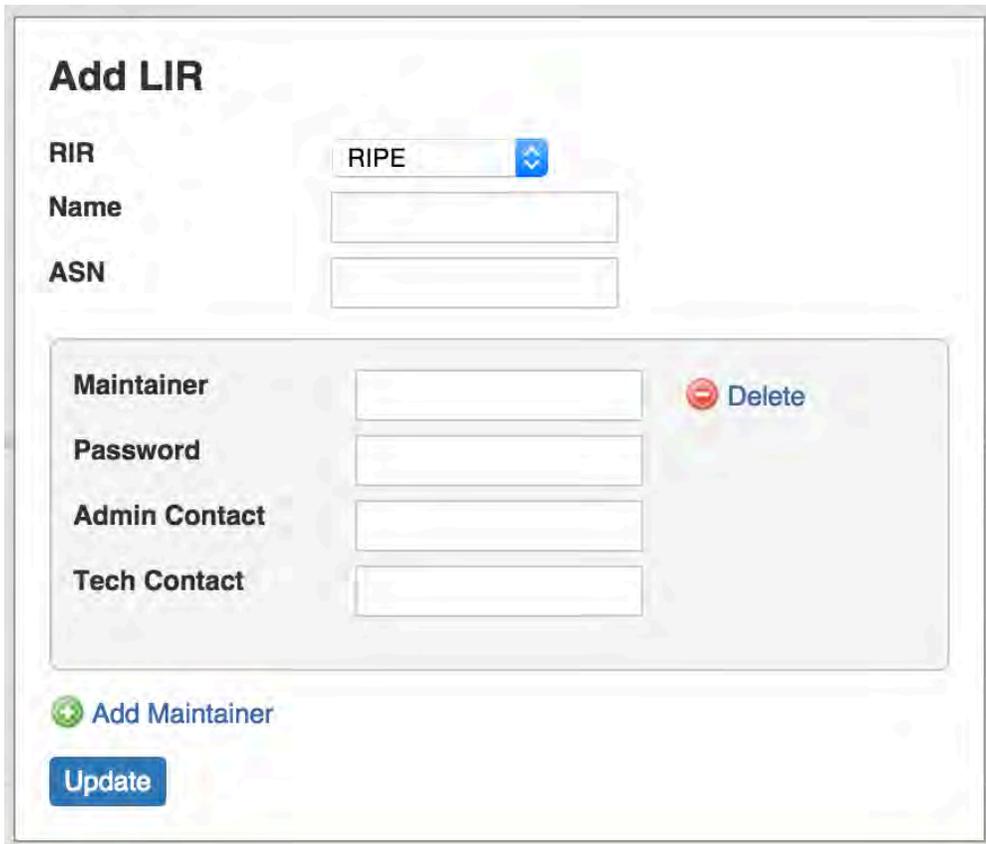

Step 1: Setup the LIR information via the LIR Manager

You will be prompted to select the RIR

The screenshot shows a dialog box titled "Add LIR" with a close button (X) in the top right corner. It contains three input fields: "RIR" with a dropdown menu showing "Select RIR...", "Name" with a text input field, and "ASN" with a text input field. A blue "Update" button is located at the bottom left of the dialog.

Then add in the requisite Maintainer Object related information:

The screenshot shows the "Add LIR" dialog box with the "RIR" dropdown menu now set to "RIPE". Below the "Name" and "ASN" fields, there is a section for "Maintainer" information. This section includes four input fields: "Maintainer", "Password", "Admin Contact", and "Tech Contact". To the right of the "Maintainer" input field is a red "Delete" button. At the bottom left of the dialog, there is a green plus icon followed by the text "Add Maintainer" and a blue "Update" button.

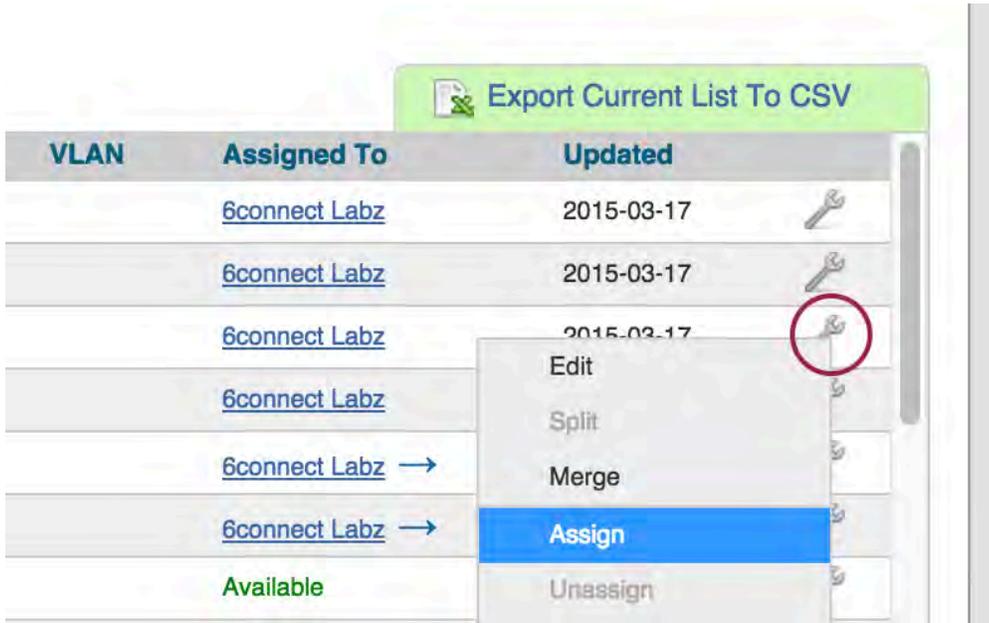

Be sure to hit "Update" when done to save your changes.

Multiple Maintainer Object Support

Note that we support multiple maintainer objects per LIR entry. Simply click on the [Add Maintainer](#) link at the bottom of the Add LIR dialog box.

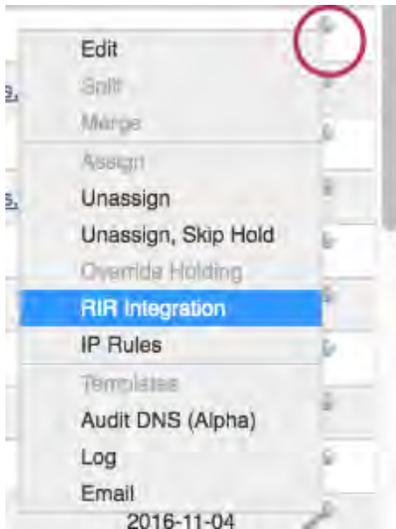

Step 2: Assign an IP block to a Resource using the IPAM Gadget or the Assign function from the IPAM Manage screen.

Go into IPAM Manage or the IPAM Gadget, and assign a block under the RIPE RIR. See [Working with IP Blocks](#) for additional detail.

Step 3: Update RPSL information

Select "RIR Integration" from the Action Menu in IPAM Manage.

Identify which LIR data you want to use for the netnum update, and select either "Create Inetnum" or "Cancel" to exit.

RIPE Integration: 141.70.66.0/24 (141.70.66.0 - 141.70.66.255)

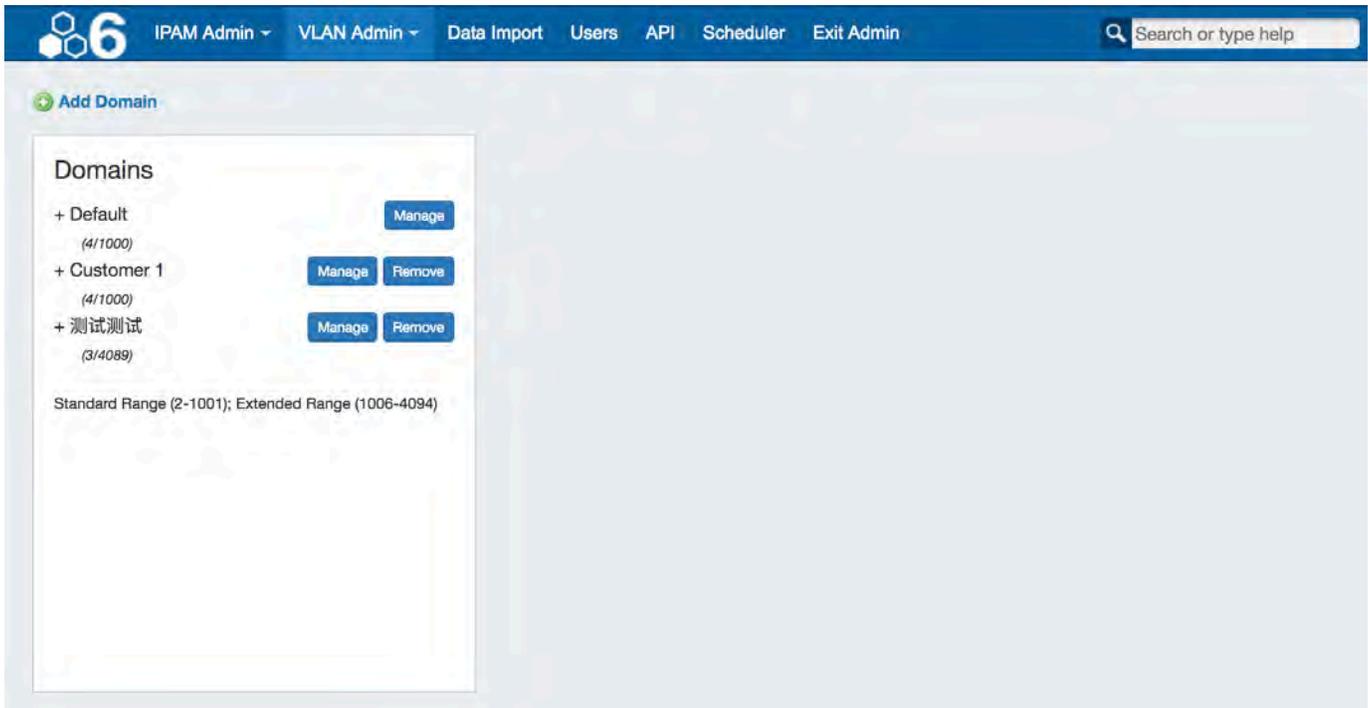

ripe

	mnt-by	admin-c	tech-c	API Key
<input checked="" type="radio"/>	OSHK	none	none	

Create Inetnum Cancel

VLAN Administration

VLAN Manager Overview

The VLAN Manager allows Admin users to add domains and VLANs to their ProVision instances, and associate them with IP Blocks. Optionally, VLAN tags may be associated with ranges or individual VLANs under a domain, to help limit VLAN search results when enabling VLANs.

Although some VLAN functionality occurs under the "standard user" area of ProVision (IPAM Tab), only Admin-level users may access the IPAM -> VLAN page. Therefore, VLAN Manager processes are included under the ProVision Admin Guide.

VLAN Manager Workflow

Most of VLAN Manager workflow is split between the Admin area of ProVision (VLAN Admin Tab), and the IPAM Tab, under the VLAN submenu. There are two types of workflow. One is the "Standard" flow, where the VLAN tag system is not used - the only primary tasks are adding domains, VLANs, and associating the domain/VLAN pairs with IP Blocks. The second workflow is using optional VLAN tags, which requires creating the VLAN tags and associating them with domains / VLANs during the domain / VLAN add processes.

For detailed information on each of these workflows, click below:

✓ [Click here for detailed VLAN Manager Workflow information...](#)

Standard flow (without VLAN tags):

The workflow starts with creating a domain in the VLAN Admin section of ProVision. During creation, domains may be selected as "standard" or "extended" domains, declaring the size of the VLAN pool from which VLANs are available to be enabled. Next, VLANs must be enabled and added to the domain. This is done under the IPAM Tab -> VLAN section of ProVision. Add VLANs to the domains by clicking "Add", searching for the desired range of VLANs to enable from the standard / extended pool, and selecting the desired VLANs to enable. Once enabled, VLANs may be edited or have IP blocks associated with that VLAN. Editing VLANs and Direct / Smart Browse / Search IPs functions for adding blocks to VLANs are available from the Domain/ VLAN list under under the IPAM Tab -> VLAN section of ProVision by expanding the desired domain and clicking on the VLAN link. IP blocks may also be edited individually through the IPAM gadget, IPAM Manage, and VLAN Manage areas to add domain and VLAN information to the block.

Optional flow (with VLAN tags):

The workflow starts with creating a domain in the VLAN Admin section of ProVision. During creation, domains may be selected as "standard" or "extended" domains, declaring the size of the VLAN pool from which VLANs are available to be enabled. VLAN tags may be added (from the VLAN Admin Tab -> Edit Tags submenu) before or after domain creation. Tags created in this area are available to all domains and VLANs.

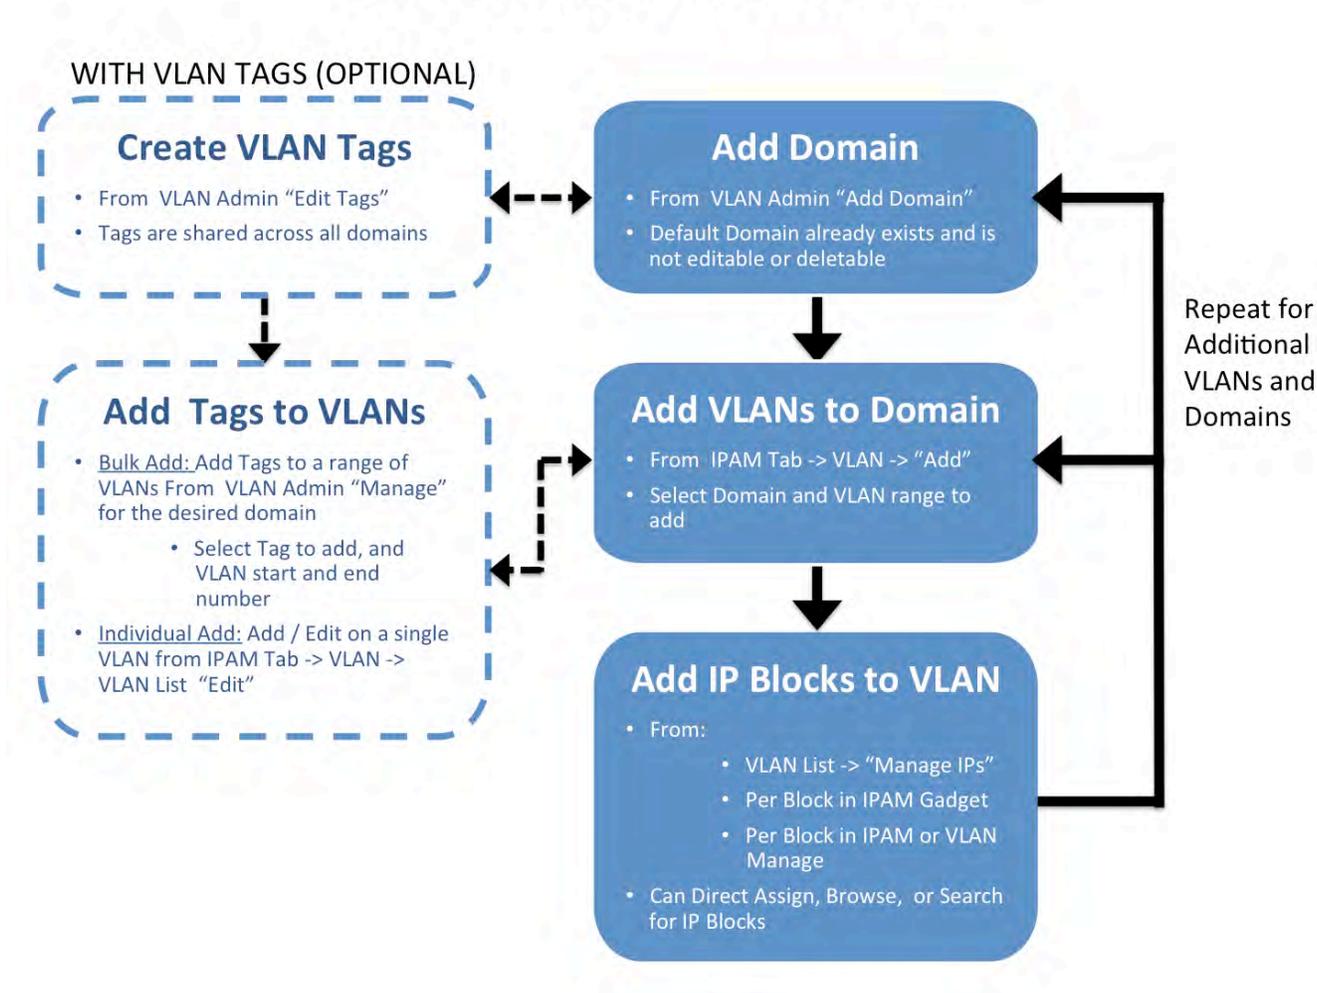

If the tags created need to be added to a large range of VLANs, the next step would be to add tags to the desired range(s) of VLANs from the VLAN Admin -> Domain "Manage" button. Domain Manage allows you to select an existing tag, type in the numeric VLAN start and end point, and assign that tag to that entire range of VLANs under the current domain.

Once a bulk range of tags is associated with VLANs, you can use the tag as a search criteria when adding VLANs to a domain. This is done under the IPAM Tab -> VLAN section of ProVision. Add VLANs to the domains by clicking "Add", using the tag name as a search field for the desired range of VLANs, and then selecting the desired VLANs to enable.

If tags are only desired for individual VLANs, they may be added when editing a VLAN after the VLAN has already been added/enabled for the domain. Editing VLANs may be accessed from the IPAM Tab -> VLAN section, then expanding the desired domain and clicking on the VLAN link, selecting "Edit".

Next, VLANs must be enabled and added to the domain. This is done under the IPAM Tab -> VLAN section of ProVision. Add VLANs to the domains by clicking "Add", searching for the desired range of VLANs to enable from the standard / extended pool, and selecting the desired VLANs to enable. Once enabled, VLANs may be edited or have IP blocks associated with that VLAN. Editing VLANs and Direct / Smart Browse / Search IPs functions for adding blocks to VLANs are available from the Domain/ VLAN list under under the IPAM Tab -> VLAN section of ProVision. IP blocks may also be edited individually through the IPAM gadget, IPAM Manage, and VLAN Manage areas to add domain and VLAN information to the block.

VLAN MANAGER WORKFLOW

Additional Information:

For details on performing specific tasks with the VLAN Manager, proceed to [Working with the VLAN Manager](#).

Working with the VLAN Manager

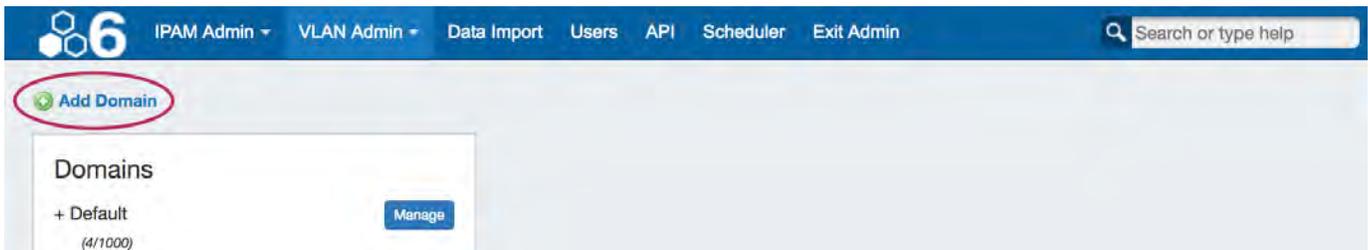

Working with the VLAN Manager (Standard Flow)

- Working with the VLAN Manager (Standard Flow)
 - Step 1) Add Domain
 - Viewing the Domain List
 - Edit a Domain
 - Remove a Domain
 - Step 2) Add VLANs to a Domain (Enable)
 - The IPAM VLAN Page
 - Add VLANs to a Domain (Enable)
 - Remove VLANs from a Domain (Disable) - API
 - Edit a VLAN
 - Step 3) Add Blocks to VLANs
 - Add / Update Blocks to VLAN from VLAN - Manage IPs:
 - Direct Add Block to VLAN:
 - Browse IP Blocks to add to VLAN:
 - Search IP Blocks to add to VLAN:
 - Add / Update VLAN to Blocks from IP Manage or VLAN Manage:
 - Add / Update VLAN to Blocks from IPAM Gadget:
 - Working with VLAN Tags - (Optional)
 - Creating VLAN Tags
 - Add VLAN Tags to VLANs
 - Add Tag to an Enabled VLAN
 - Add Tag to a Range of the VLAN Pool
 - Working with VLAN Metadata - (Optional)
 - Enable / Disable VLAN Metadata Fields
 - View / Edit Metadata Field Information

Step 1) Add Domain

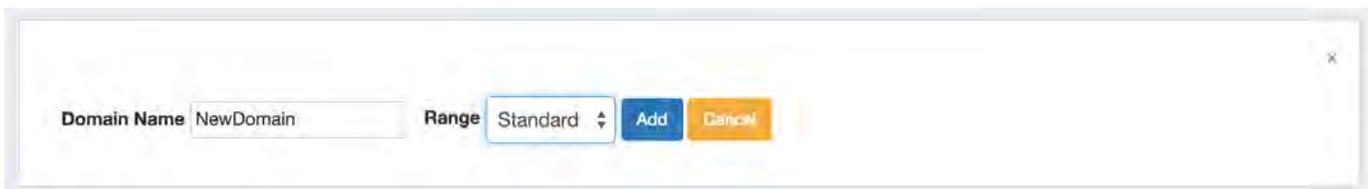

Users will already have a non-editable Default Domain created, which may house VLANs entered under the previous VLAN text field, however, you may choose to create new domains.

To create a new VLAN domain, navigate to the [VLAN Admin](#) Tab, in the Admin area of ProVision, and click on "Add Domain".

Enter the domain name, and select whether it is standard or extended - Standard has a range of VLAN IDs from 1-1005; Extended includes up to 4094.

NOTE: The ProVision UI and API has restricted usage of VLANs 1 and 1002-1005 in tagging and selecting or searching VLANs.

Click "Add", and your new domain will be added to the Domain list below.

Viewing the Domain List

If a domain already has VLANs enabled for it, clicking on the "+" sign in front of the domain name will expand the domain list to show enabled VLANs.

The numbers in parentheses under the domain name (shown as 21/1000 in the above image for a standard domain; an extended domain would show as 21/4089) indicate the quantity of enabled VLANs over the available pool of VLANs to select from. There are 5 VLANs (1, 1002-1005) which are reserved, and not included in the count.

Edit a Domain

The Default Domain is not editable, however users may edit the name of user-created domains.

Once a domain has been created, users may not edit the range (standard / extended) of a domain - if a domain is created with a mistaken range, it must be deleted and re-created.

To edit a domain name, click on the "Manage" button next to the domain name.

Under the "Edit Domain Name" section of the page, edit the name as desired, then hit "Save".

Remove a Domain

To edit a domain, click on the "Manage" button next to the domain name.

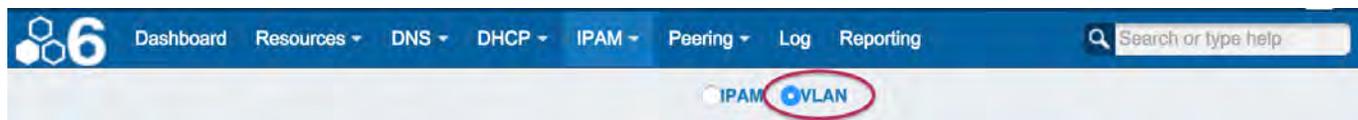

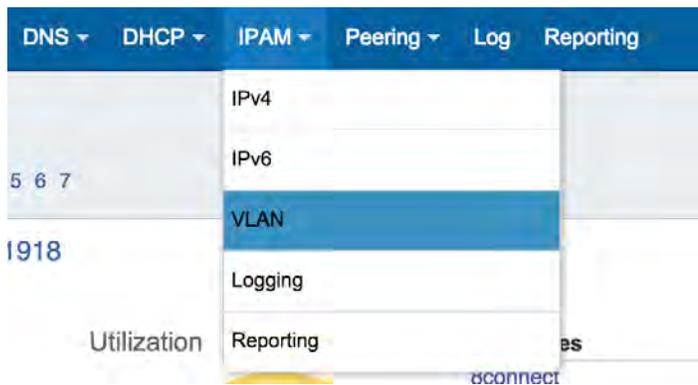

Then, edit the name as desired and hit "Save".

Step 2) Add VLANs to a Domain (Enable)

After creating domains, VLANs need to be added (enabled) for that domain out of the pool of available VLANs.

The IPAM VLAN Page

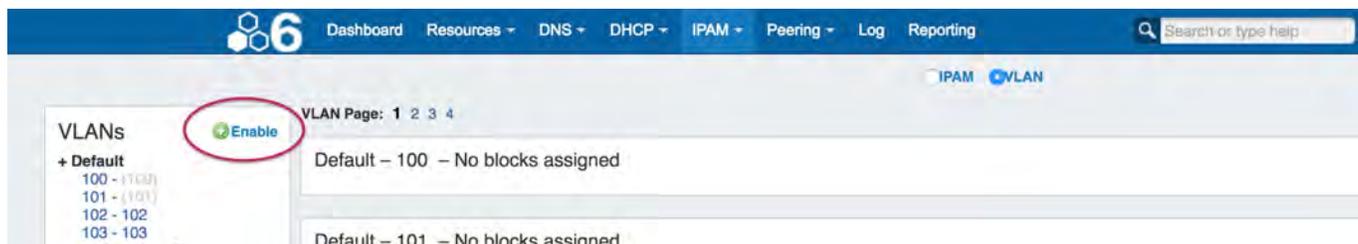

Go to the IPAM Tab, and then either select VLAN from the IPAM dropdown menu, or click "VLAN" from the radio buttons that appear on the IPAM page.

This takes you to the IPAM - VLAN page, which shows an overview of Domains and VLANs on the left sidebar (click the + next to the domain names to see the enabled VLANs under each domain), and similar to the IPAM page, shows IPAM Utilization data for each Domain / VLAN pair. Clicking on the wrench will open "VLAN Manage", which has the same type of functionality for IP blocks as IPAM Manage, but organized under the scope of that VLAN.

Add VLANs to a Domain (Enable)

In the IPAM - VLAN page VLAN sidebar, click "Enable".

This changes the sidebar into a VLAN search module. Select the desired domain, range of VLANs to view, and click "Search".

Enable VLANs Cancel

Domain:

Range of ID:
 –

Tags:

21 VLANs found.

Default

<input type="checkbox"/>	Select All
<input type="checkbox"/>	50
<input type="checkbox"/>	51
<input type="checkbox"/>	52
<input type="checkbox"/>	...

Note: If VLAN Tags have already been applied to a range of VLANs, you may also include VLAN tag criteria in your search. If tags have not been created or applied to a range of VLANs, searching by tags will not return results.

Below the search criteria, the results list will show VLANs meeting your criteria.

Select the desired VLANs to enable for the domain - you may either select all VLANs in your results list, or check VLANs individually.

NewDomain2

<input checked="" type="checkbox"/>	Select All
<input checked="" type="checkbox"/>	50
<input checked="" type="checkbox"/>	51
<input checked="" type="checkbox"/>	52
<input checked="" type="checkbox"/>	53
<input checked="" type="checkbox"/>	54
<input checked="" type="checkbox"/>	55
<input checked="" type="checkbox"/>	56
<input checked="" type="checkbox"/>	57
<input checked="" type="checkbox"/>	58
<input checked="" type="checkbox"/>	59
<input checked="" type="checkbox"/>	60
<input checked="" type="checkbox"/>	61
<input checked="" type="checkbox"/>	62
<input checked="" type="checkbox"/>	63
<input checked="" type="checkbox"/>	64
<input checked="" type="checkbox"/>	65
<input checked="" type="checkbox"/>	66

When done selecting the VLANs, click "Enable Selected". The selected VLANs will now be enabled for the domain, show in Domain / VLAN lists, and be available to edit or add blocks to. To add more VLANs to another domain, click "Reset" and repeat the process. If done, hit the "Cancel"

button at the top of the Add VLAN module, and you will return to the main IPAM - VLAN page view.

Remove VLANs from a Domain (Disable) - API

Disabling a VLAN (removing the VLAN from a domain) may be done through the VLAN API "update" endpoint.

A VLAN may be enabled or disabled by setting its "enabled" parameter to true (enable) or false (disable), after providing the required id.

An example API call to disable a VLAN with id=41438 would look like:

```
{instance url}/api/v1/api.php?target=vlan&action=update&id=41438&enabled=false
```

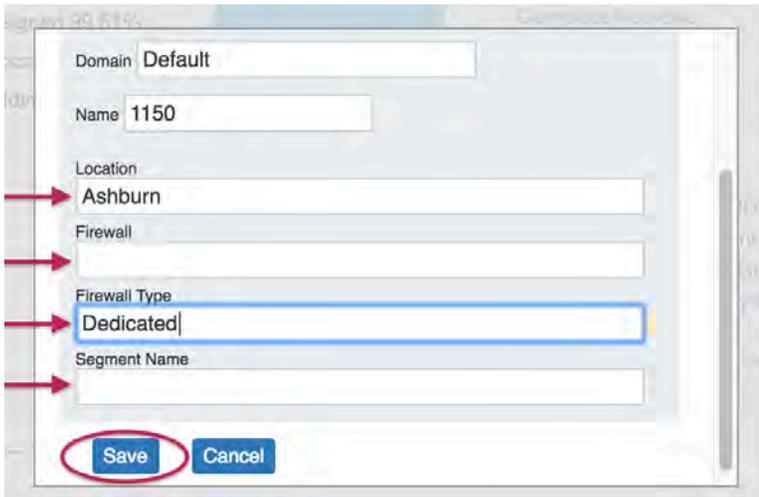

For details on the VLAN update endpoint, see [API Module - VLAN - \(update\)](#).

Edit a VLAN

You can edit a VLAN by clicking on the VLAN in the VLAN List sidebar, then selecting "Edit".

You cannot change the Domain of the VLAN, but you can add a descriptive text name, apply a VLAN tag (if using the tag system), or edit VLAN Metadata (if enabled).

After making your changes, click the "Save" button. The named VLAN will now show both VLAN number and name when viewing Domain / VLAN lists or when working with blocks.

Step 3) Add Blocks to VLANs

After VLANs have been enabled for domains, you can associate those VLANs with IP blocks.

Add / Update Blocks to VLAN from VLAN - Manage IPs:

While in the IPAM Tab -> VLAN Page, expand the desired domain and click on a VLAN. Then select "Manage IPs".

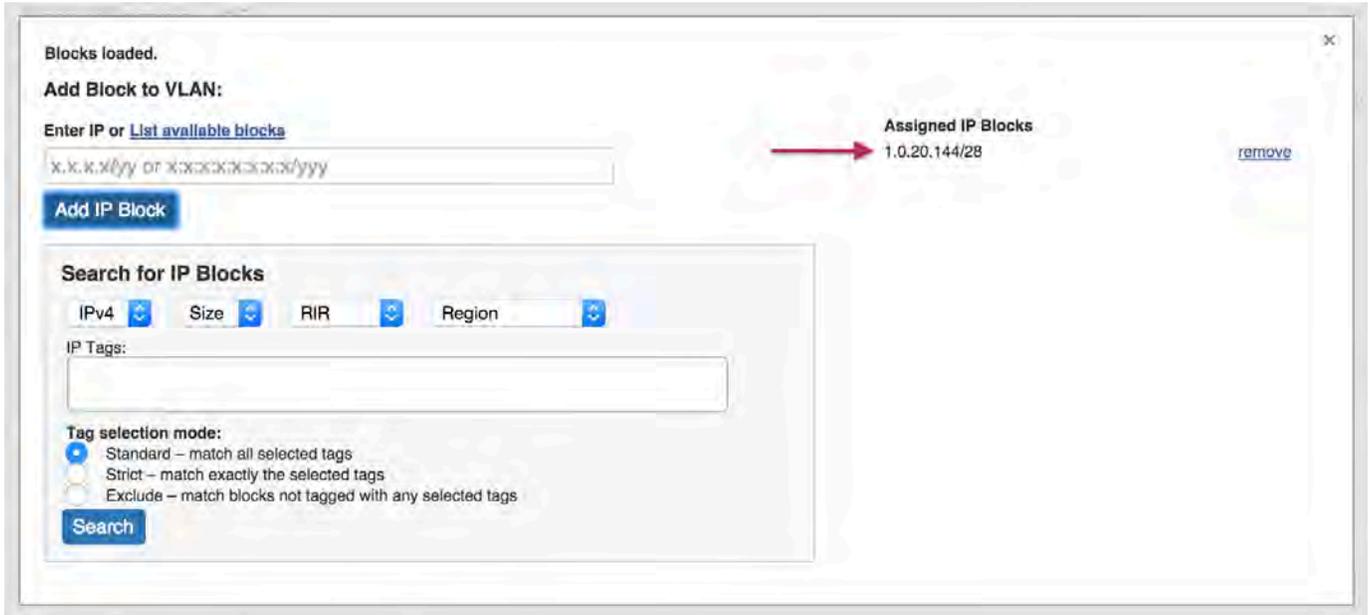

This opens up a window where IP Blocks may be associated to the VLAN. From here, you can "Direct Assign" a block to the VLAN, "Browse Assign" blocks, or Search for a block to add to the VLAN.

Direct Add Block to VLAN:

Directly add a known, available IP Block by typing in the CIDR, then hitting "Add IP Block".

When complete, the block will be added to the "Assigned IP Blocks" list on the right of the window, with the option to remove if desired.

Browse IP Blocks to add to VLAN:

Browse blocks available to add to the VLAN by clicking on the "List available blocks" link above the IP block input box.

This opens a window similar to the "Smart Browse" used in assigning IPs to a resource - just select IPv4, IPv6 blocks, or Resources to browse from the radio buttons at the top of the list.

When you have selected the block to add, click "add to VLAN".

Assign IP

Show: IPv4 IPv6 Resources

Address	RIR	Region	Tags	Code	
1.0.10.36/32	ARIN		AAA, Customer		add to VLAN
1.0.10.37/32	ARIN		AAA, Customer		add to VLAN
1.0.10.48/28	1918				add to VLAN
1.0.10.144/28	ARIN		BBB	CODE	add to VLAN
1.0.10.192/27	1918		Customer	CODE	add to VLAN

1.0.20.195/32	ARIN				add to VLAN
1.0.20.208/28	1918				add to VLAN
8.8.3.0/24	1918				add to VLAN
8.8.8.0/25	ARIN				add to VLAN
8.15.3.2/32	ARIN				add to VLAN
10.0.0.0/12	1918		DHCP		add to VLAN
10.0.0.0/26	1918		AAA		add to VLAN
10.0.0.2/32	1918		AAA, PTP	CODE	add to VLAN
10.0.0.3/32	1918		Customer, Dev	CODE	add to VLAN
10.0.0.6/32	1918		AAA, PTP	CODE	add to VLAN
10.0.0.8/29	1918		AAA, PTP		add to VLAN
10.0.0.16/28	1918		AAA, PTP		add to VLAN
10.0.0.32/27	1918		AAA, PTP		add to VLAN

Cancel

The selected block will automatically fill in the block input box - just hit "Add to IP Block" below the input to finalize the addition.

Blocks loaded.

Add Block to VLAN:

Enter IP or [List available blocks](#)

1.0.20.144/28

[Add IP Block](#)

Assigned IP Blocks

Search for IP Blocks

IPv4 Size RIR Region

IP Tags:

Tag selection mode:

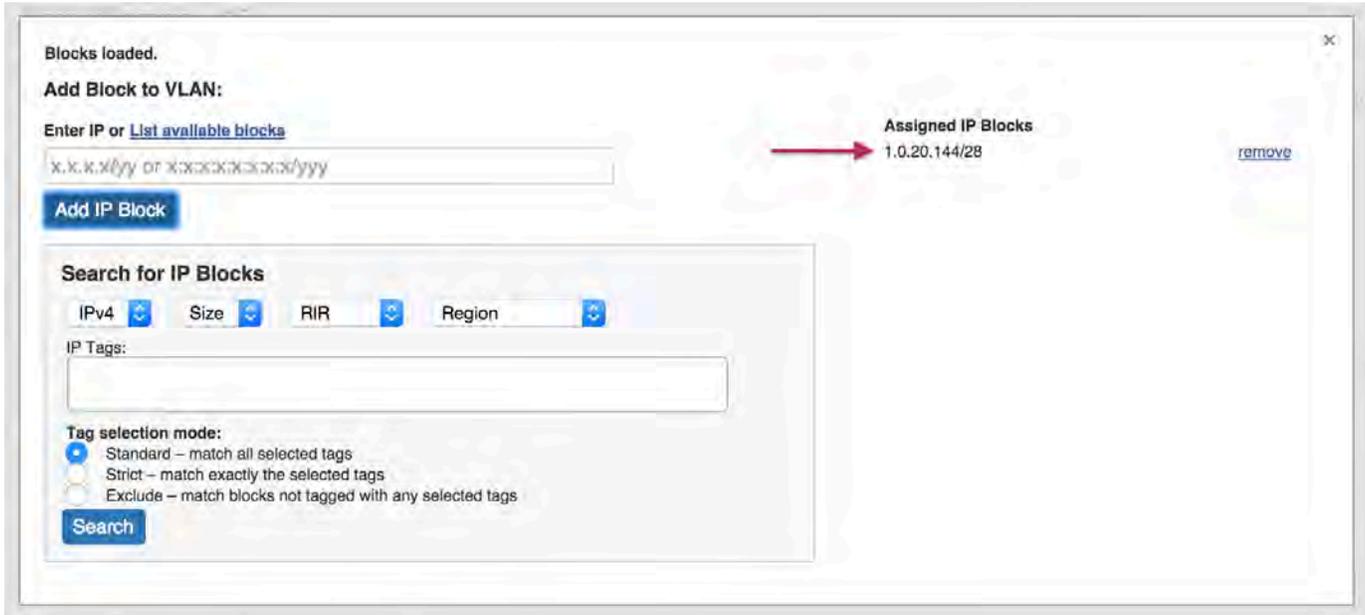

Standard - match all selected tags

Strict - match exactly the selected tags

Exclude - match blocks not tagged with any selected tags

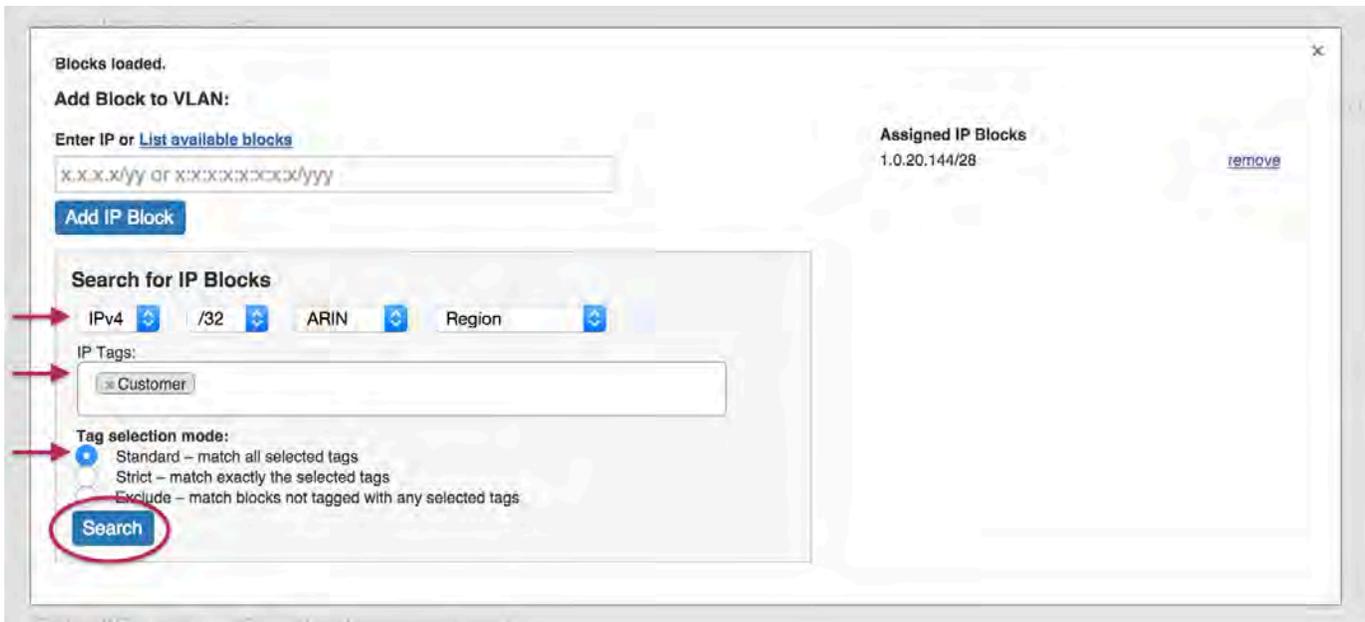

[Search](#)

When complete, the block will be added to the "Assigned IP Blocks" list on the right of the window, with the option to remove if desired.

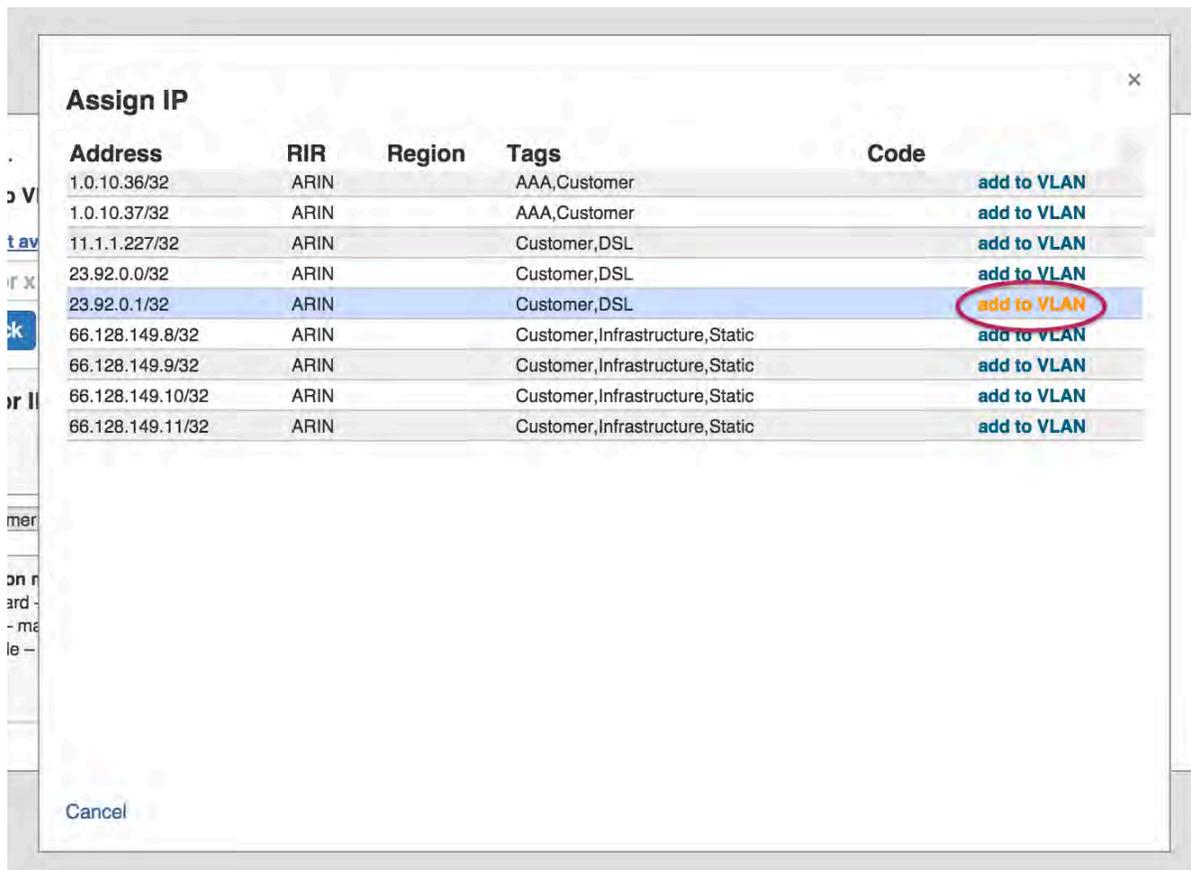

Search IP Blocks to add to VLAN:

Select search criteria of IPv4 / IPv6, size, RIR, Region, or Associated Tags / Tag selection mode to create a filtered list of IP blocks meeting that criteria. Then, click "Search".

This opens a window with filtered results matching your criteria.

When you have selected the block to add, click "add to VLAN".

The selected block will automatically fill in the block input box - just hit "Add to IP Block" below the input to finalize the addition.

When complete, the block will be added to the "Assigned IP Blocks" list on the right of the window, with the option to remove if desired.

Add / Update VLAN to Blocks from IP Manage or VLAN Manage:

When editing a block in either IP Manage (IPAM Tab -> Action Menu (wrench) -> Manage), or VLAN Manage (IPAM Tab - VLAN -> Action Menu (wrench)), you can select an existing domain and VLAN to associate to the block.

From either of the Manage screens, click on the Action Menu (wrench icon) for the desired block, then select "Edit".

VLANS and Child Blocks

NOTE: Child blocks whose Parent blocks already have an assigned Domain / VLAN, may not have domains and VLANs changed to be different than the Parent Block's values. If you attempt to save domain / VLAN changes to a child block under this situation, an error will occur.

i.e., Parent and Child IP Blocks must have matching Domain / VLAN values.

Add / Update VLAN to Blocks from IPAM Gadget:

You may also add / edit Domain /VLAN information when editing a block in the IPAM Gadget. From the IP block's Action Menu (wrench icon), select "Edit".

1.0.10.64/32	1	Ashburn, VA		2015-11-18	2015-11-18	
1.0.10.66/31 →	2	Ashburn, VA	BB,BBB		2015-11-23	
1.0.10.68/30 →	4	Ashburn, VA	Cable		2015-11-24

1.0.10.131/32	1	Denver, CO	NOTES		2015-11-23	

Then, in the Edit Attributes menu that pops up, select the desired Domain / VLAN information, and click "save".

Working with VLAN Tags - (Optional)

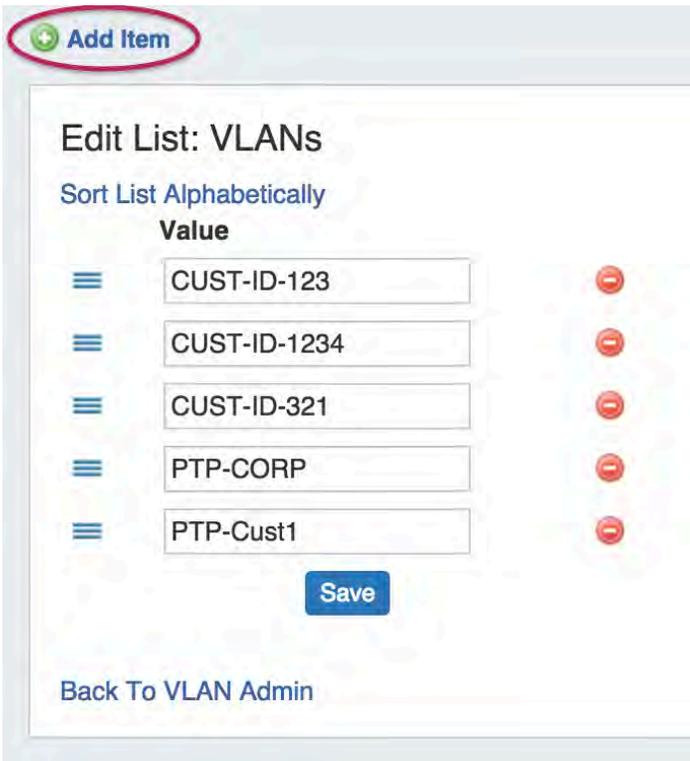

VLAN tags provide further organizational / search criteria when searching for VLANs to enable.

Creating VLAN Tags

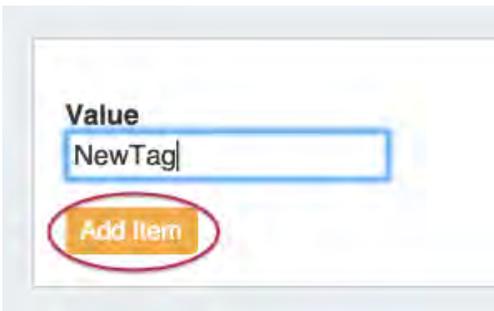

Create VLAN Tags from the VLAN Admin Tab, in the Admin area of ProVision, and select "Edit Tags" from the dropdown.

To add a new VLAN tag, click on "Add Item" at the top of the Edit List: VLAN Tags page.

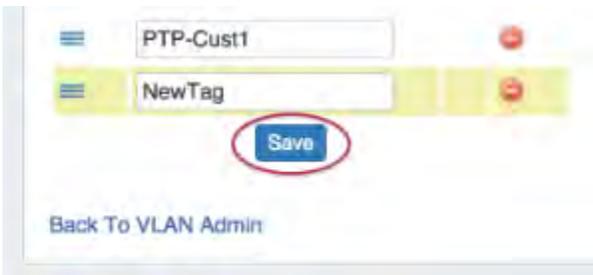

Then, type in the desired name value for the new tag, and hit "Add Item". The new tag will be added to the list below.

To **edit** a tag, simply type your changes in to the text box with the tag name. Tags with unsaved changes will be highlighted until saved.

To **delete** a tag, click on the red "delete" symbol to the right of the tag name.

When complete, be sure to click on the "Save" button to save your changes.

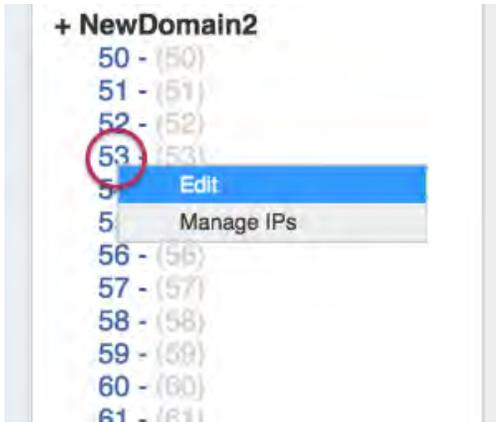

Once VLAN tags have been created, they will be available to add to VLAN ranges and use in the "Add VLAN" search function.

Add VLAN Tags to VLANs

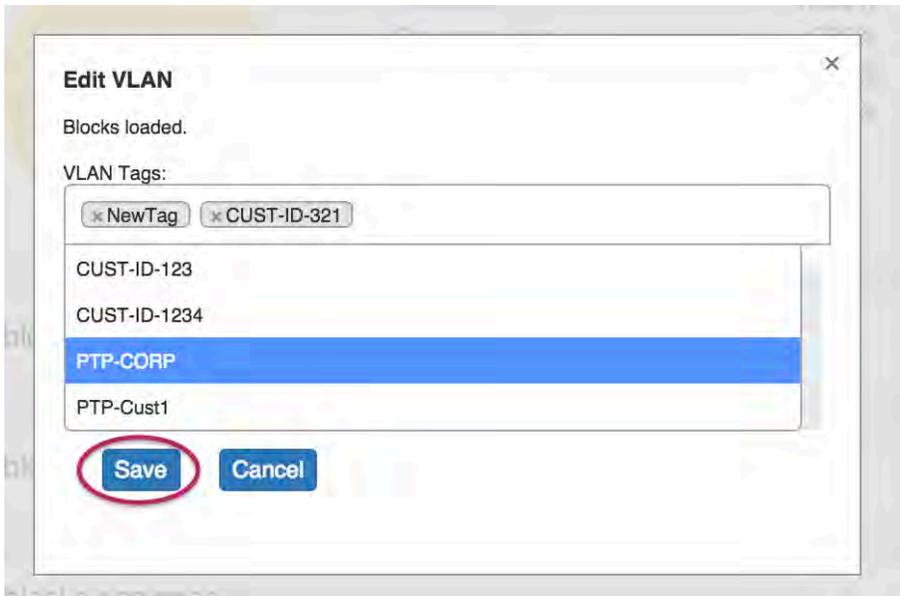

VLAN tags may be added to VLANs in two ways: Editing an already-enabled VLAN (VLAN Edit), or by assigning the tag to a range of VLANs from the Domain VLAN pool (un-enabled VLANs, which are then available to search by VLAN tag to enable).

Add Tag to an Enabled VLAN

Edit an existing, already enabled VLAN by clicking on the VLAN in the VLAN List sidebar, then selecting "Edit".

Apply a VLAN tag from clicking in the "VLAN Tags" box, and selecting one or more VLAN Tags.

After making your changes, click the "Save" button. Tagged VLANs will be viewable in the VLAN Chart a single tag points under VLAN Admin - Domain Manage.

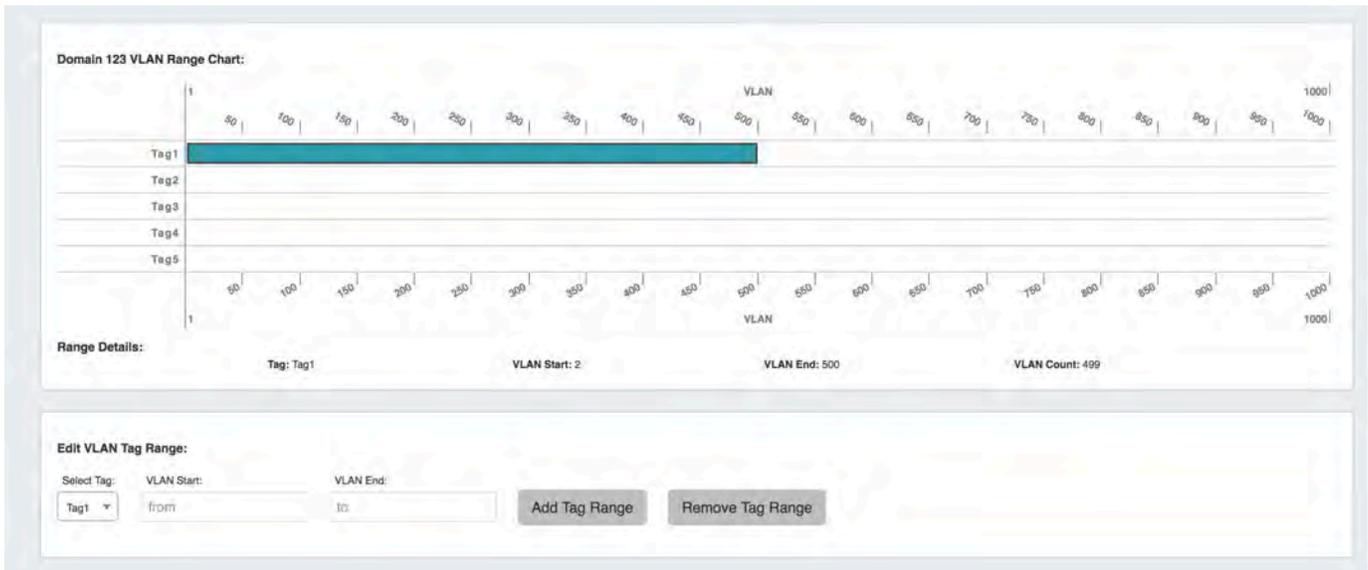

Add Tag to a Range of the VLAN Pool

You can also tag a range of the (un-enabled) VLANs in a domain's VLAN pool. Then, when moving on to enable a set of VLANs for a Domain, you can select those VLANs by tag.

Go to the VLAN Admin Tab in the Admin area of ProVision. Then, next to the desired domain, click "Manage".

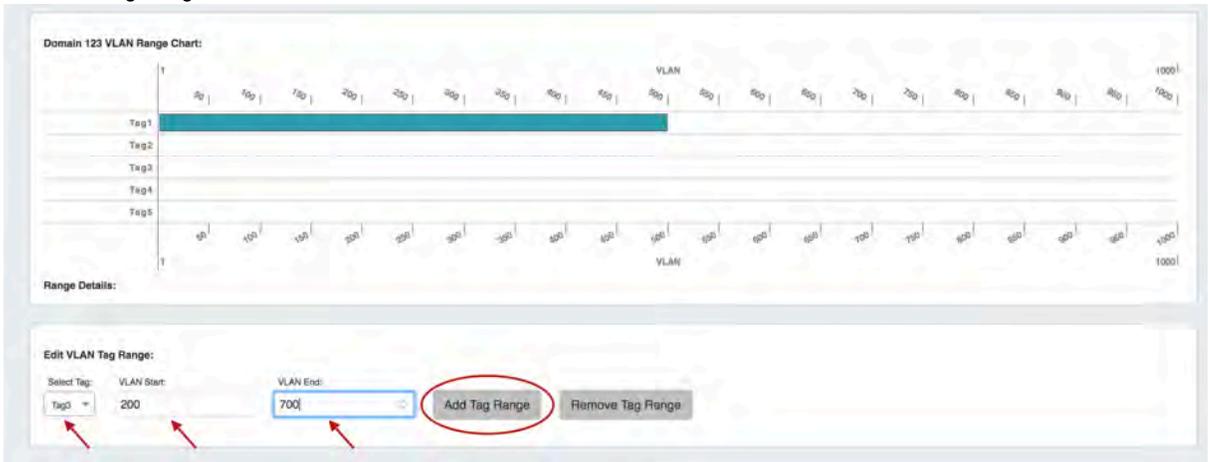

This brings up the page to edit the domain or view a chart of VLAN tags (y axis) to VLANs in the available pool (x axis).

Hovering the mouse over a tag range will show details such as the range start, end, and count of vlans in the range.

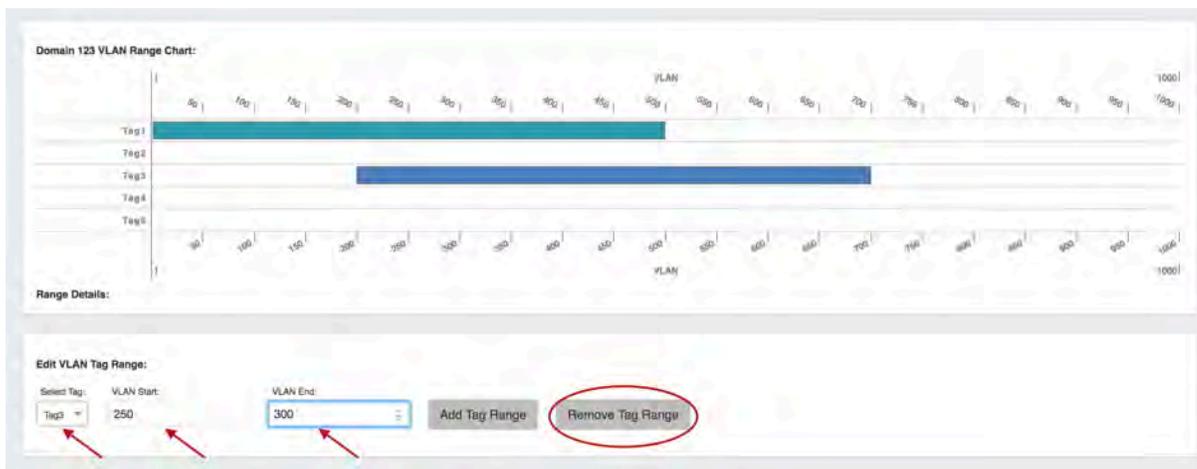

Under the "Edit VLAN Tag Range" section, you can bulk assign tags to ranges by:

1. Select the tag to edit in dropdown below chart
2. Type desired VLAN start and end value for the range
3. Click "Add Tag Range" to set and save.

To remove a range of tags, under "Edit VLAN Tag Range":

1. Select tag to edit in dropdown below chart
2. Type desired VLAN start and end value for the range to remove
3. Click "Remove Tag Range" to set and save.

- To untag a single VLAN, simply enter the same VLAN value in the VLAN Start and VLAN End boxes, then hit "Remove Tag Range".

- Changes to tag ranges are automatically saved when clicking "Add Tag Range" or "Remove Tag Range", so after all desired changes are made, you may immediately exit the page.

Once assigned, the tags show as a property of the VLAN block in the VLAN edit menu and may be used for VLAN Searches / Assignments.

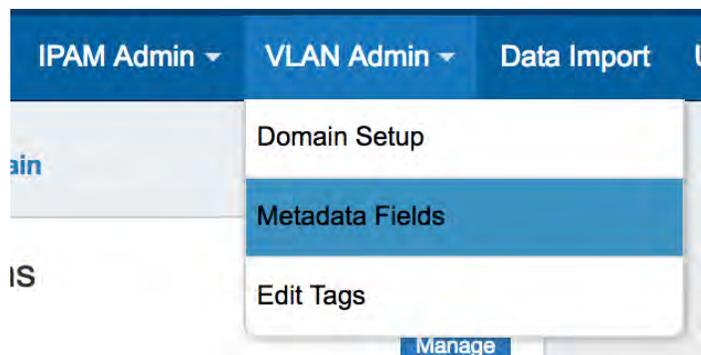

Working with VLAN Metadata - (Optional)

Customizable metadata fields are available to hold VLAN-specific information such as Location, Client, Firewall, Gateway, and more.

These fields can be enabled and disabled in the VLAN Admin section of ProVision, and viewed / edited under "Edit VLAN" in the VLAN Tab.

Enable / Disable VLAN Metadata Fields

VLAN Metadata fields can be enabled and disabled under the [VLAN Admin](#) area of ProVision.

To enable a new Metadata Field, navigate to the Admin section of ProVision, and select "Metadata Fields" from the dropdown.

VLAN Metadata Fields

VLAN metadata fields allow for custom data to be saved for each VLAN. Type the desired field name under "Field Display Name". Enable or disable fields for display by clicking the checkbox.

Once enabled, fields display for all enabled VLANs. Data associated with a field is retained if the field is disabled.

Field Display Name

<input checked="" type="checkbox"/>	Location
<input checked="" type="checkbox"/>	Firewall
<input checked="" type="checkbox"/>	Firewall Type
<input checked="" type="checkbox"/>	Segment Name
<input type="checkbox"/>	Field display name
<input type="checkbox"/>	Field display name
<input type="checkbox"/>	Field display name
<input type="checkbox"/>	Field display name
<input type="checkbox"/>	Field display name
<input type="checkbox"/>	Field display name

Save

To enable a new field, type the desired field name in an empty text input box under "Field Display Name", and select the check box next to the new name. Then, click "Save" to save your changes. Field display names may be edited at any time by simply typing the desired change into the "Field Display Name" box and saving your changes.

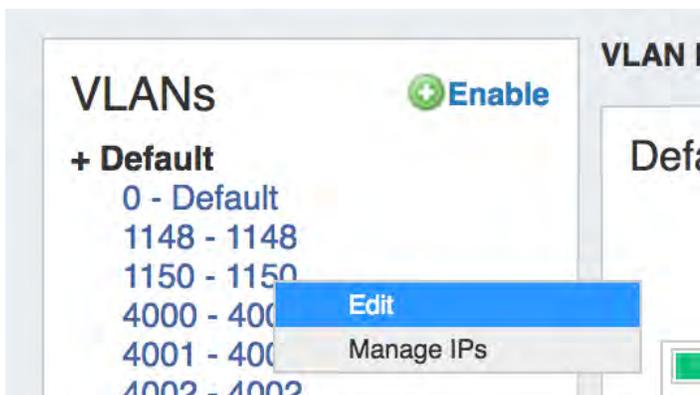

Once enabled, a metadata field displays for all enabled VLANs.

To disable a metadata field, deselect the check box next to the Field Display Name and click "Save". Any data that exists under a disabled field is retained, and will reappear once the field is re-enabled.

View / Edit Metadata Field Information

VLAN Metadata may be viewed and edited in from the IPAM - VLAN Tab.

While in the IPAM Tab -> VLAN Page, expand the desired domain from the left sidebar and click on a VLAN. Then select "Edit".

In the Edit VLAN screen, you may view the Metadata or enter your desired changes and click "Save" when done.

DNS Administration

DNS Administration

The screenshot shows the 'DNS Servers' sub-tab within the 'DNSv3' section of a management console. The interface includes a navigation bar with 'Dashboard', 'Resources', 'DNS', 'DHCP', 'IPAM', 'Peering', 'Log', and 'Reporting'. A search bar is located in the top right corner. Below the navigation, there are tabs for 'DNSv3', 'DNS Groups', and 'DNS Servers'. The main content area is titled 'DNS Server List' and features an 'Add Server' button. A table lists five DNS servers with columns for 'Server Name', 'Server Backend', 'Server Type', 'Server Status', and 'Actions'. Each server entry has 'Delete' and 'Push' buttons in the 'Actions' column.

Server Name	Server Backend	Server Type	Server Status	Actions
6c BIND QA Server	ISCBIND	master		Delete Push
6c Infoblox test VM1	INFOBLOX	master		Delete Push
6c PowerDNS QA	PDNSMYSQL	master		Delete Push
6c S64 Auth Server QA 2	SECURE64	master		Delete Push
6c S64 Server1	SECURE64	master		Delete Push

DNS Administration in DNSv3 is primarily handled under the **DNS** tab **DNS Servers** sub-tab.

The **DNS Servers** tab is only accessible to Admin users, and contains functions for adding, updating, and managing DNS servers as well as scheduling server tasks.

Additional DNS Admin tasks occur in other ProVision areas, and not all management tasks require Admin-level permissions - some only require appropriate resource permissions on the DNS Groups, Zones, and servers involved. See additional sections on this page for more detailed information:

- DNS Administration
 - DNSv3 Overview
 - DNSv3 Permissions
 - DNSv3 Administrative Tasks
 - Manage DNS Servers
 - ACLs / Views
 - DNS Zone Transfers (Pushes)
 - Manual DNS Pushes:
 - Scheduled DNS Pushes:
 - DNS Record Types
 - Global DNS Settings (Local Installation Only)
 - DNS Export Functions
 - Exporting Zones
 - Importing DNS Zones:
 - Additional Information:
 - System Information for Local Installations
 - Additional Sections:

DNSv3 Overview

DNSv3 reorganizes ProVision's DNS system into a more unified and accessible interface, combining both admin and non-admin DNS tasks together under the **DNS** tab.

In DNSv3, zones are gathered under DNS Groups, servers are attached to those Groups, and Nameservers, Default SOA values, and ACLs are managed at a per-Group level.

Users can then view and manage Groups, individual zones, default SOA values, ACLs, attach servers, and perform pushes all on the same page.

DNSv3 Permissions

DNSv3 (6.0.0 release), restructures DNS to incorporate DNS zones and Groups into ProVision's Resource System. Zones and Groups are Resources just like Customers, Servers, Routers, or Contacts (See [Resource Concepts](#) for a more detailed explanation of Resources in ProVision).

This allows for DNS zones and Group permissions to be managed similarly to other ProVision resources, where users with Resource permissions (Create / Read / Update / Delete) on the parent resource of the DNS Group can create groups and zones, manage those groups and zones, push (if a server is attached), and delete.

A user with full Resource permissions on a DNS Server, as well as the parent resource of a Group, may view and attach that server to a Group.

Users with Admin permissions can access the **DNS Servers** area under the **DNS** tab manage DNS server creation, edits, and deletion.

For more information on setting up permissions groups in ProVision, see [Users & Permissions](#).

DNSv3 Administrative Tasks

Admin-only tasks in DNSv3 include setting DNS Globals, importing zones, scheduling pushes, and managing DNS Servers.

These tasks may be accessed in the following areas:

- DNS Global Settings (Local Installs): [Admin Preferences](#) page.
- Importing DNS Zones: the [Data Import](#) tab, see [Import DNS Zones](#).
- Scheduling DNS Pushes:
 - May be set up from the [Scheduler](#) or,
 - Set by server from the [DNS Servers](#) page, or
 - Set by DNS Group from the [DNS Groups](#) page, or
 - Set by individual zone from the [View Zone](#) page
- Managing DNS Servers: The [DNS Servers](#) page

Tasks such as working with zones, DNS Groups, adding ACLs, attaching servers to Groups, and manually pushing zones do not require ProVision Admin permissions.

Instead, these tasks simply require that the user be included in a [User Group](#) that has appropriate permissions (either direct, or inherited) on the DNS zones, Groups, and servers involved.

Manage DNS Servers

Adding, configuring, and managing DNS Servers occurs in the Admin-only **DNS Servers** page under the **DNS** Tab.

Supported DNSv3 server types include:

- ISC BIND
- Secure 64 (Authority, x86 Authority, KNOT Authority, Cache, Signer)
- PowerDNS (BIND and MySQL)
- InfoBlox
- Knot DNS
- NS ONE
- DynDNS
- DNSMadeEasy
- Dummy (a fake server entry used for servers outside of ProVision access, in order to manage master / slave configurations)

For detailed information on adding, editing, and deleting DNS Servers, see [Working with DNS Servers](#).

ACLs / Views

In DNSv3, Views may be created by selecting the "Export Groups as Views" toggle and selecting a DNS Group under the server details sections "DNS Group Settings".

DNS Group Settings

Export Groups as Views: ON

Check this option if you want to enable the support of different DNS Groups to be exported as Views.

Default Group for Direct Zones:

Default Group

The zones that are directly connected to the server are going to be added to this group.

Attach to Groups:

- ✕ Default Grou
- ✕ Chrome Gro
- ✕ FirefoxGroup
- ✕ GoogleDNS

The server will be attached to the list of the groups and the zones from the groups are going to be exported automatically.

ACLs are managed on a per-DNS Group level, and may be added, edited, or removed by any user with appropriate resource permissions on the DNS Group.

Applied ACLs

[Add or Edit ACL](#)

ACL Name	ACL Networks	Actions
Example List	10.10.3.0/24	Detach
Example List234	10.10.3.0/24	Detach

For details on working with ACLs, see [Configuring Split Horizon/Views](#).

DNS Zone Transfers (Pushes)

In DNSv3, zones may be pushed manually or scheduled for a future time, and may be performed for a single zone, all zones in a DNS Group, or all zones on a server.

Scheduling DNS pushes requires administrative access, but manual pushes only require permissions on the DNS Group / DNS Zone, and the server(s) attached.

Manual DNS Pushes:

Manual pushes may be performed from the following locations in ProVision:

- Single Zone: From the DNS Groups Zone list "Push" button. See [Working with DNS Zones - Pushing Zones](#)
- Single Zone: From the DNS View Zone page "Push Zone Now" button. See [Working with DNS Zones - Pushing Zones](#)
- Group: From the DNS Groups Zone list "Push Group" button. See [Working with DNS Groups - Pushing a Group](#)
- Server: From the DNS Servers list "Push" button. See [Working with DNS Servers - Pushing a server](#)
- Server: From the DNS Server Settings page "Push Zones" button. See [Working with DNS Servers - Pushing a server](#)

Scheduled DNS Pushes:

Scheduled pushes may be performed from the following locations in ProVision:

- May be set up from the [Scheduler](#) for single zones, all zones in a Group, or all zones on a server.
- Set by server from the [DNS Servers](#) page, or
- Set by DNS Group from the [DNS Groups](#) page, or
- Set by individual zone from the [View Zone](#) page

DNS Record Types

DNSv3 Record Types are a static list comprised of:

- A, AAAA, CNAME, DNAME, DNSKEY, DS, MX, NAPTR, NS, PTR, SOA, SRV, SPF, HINFO, TXT.

Any user with appropriate resource permissions on the DNS Zone / DNS Group may add, edit, or delete DNS Records.

See [Working with DNS Zones - Common Tasks](#) for detailed information on managing DNS Records.

Global DNS Settings (Local Installation Only)

DNS Global Settings is accessible from the [Admin Preferences](#) page by users with Admin level permissions.

DNS Global Settings

DNS Tools

DNSSEC validation server: Address of DNSSEC validation server, required to be a non-authoritative name server.

DNS Export Functions

Exporting Zones

Individual Zones:

DNS zones may be exported individually from the zone's View Zone page "Export Zone" button, by any user with appropriate zone permissions (see: [Editing DNS Zones](#)).

Zones in a DNS Group:

All zones under a DNS Group may be exported from the DNS Group "Export Zones" button, by any user with the appropriate group permissions (see: [Working with DNS Groups](#)).

Zones directly connected to a server:

Zones directly connected to a server may be exported by Admin users from the DNS Server Details page, under the section "Zones connected directly to the server".

Expand the module by clicking the (>) arrow, and then click the "Export Zones" button.

Zone Name	Last Pushed	Last Modified	Records	Zone Status	Actions
ibmZoneUpdateTest2.com.	05/10/2017 12:53:39	06/05/2017 14:42:32	0	Contains Errors	Check

Importing DNS Zones:

ProVision offers six DNS zone import options, available under the **Data Import** tab in the Admin section. For more information on importing DNS zones, see [Importing your Data](#) and [Import DNS Zones](#).

BIND Zone Upload / Import: Imports DNS zones using the named.conf configuration file tied to the zones you are uploading, a .zip or .tar file of the zones themselves, and an optional .csv file mapping zones to customers and DNS Servers. This is the simplest and most commonly used import method. Refer to [Import DNS Zones](#) for more information.

PowerDNS Zone Import: This tool is available after [configuring a PowerDNS server](#) with a MySQL backend. The PowerDNS Import connects to the selected server and imports all zones.

InfoBlox Zone Import: Imports DNS zones using a provided Host, Username, and Password. The InfoBlox import pulls all zones on the InfoBlox LOCAL grid and adds them to a designated Group. It is advised to [create a DNS Group](#) prior to the import with default parameters and NS records to be inherited by the imported records.

NS ONE Zone Import: Imports DNS zones using a NS One API Key. It is advised to [create a DNS Group](#) prior to the import with default parameters and NS records to be inherited by the imported records.

Dyn DNS Zone Import: Imports DNS zones using a Dyn DNS Customer Name, Username, and Password. It is advised to [create a DNS Group](#) prior to the import with default parameters and NS records to be inherited by the imported records.

DNSMadeEasy Zone Import: Imports DNS zones using a DNSMadeEasy API Key and API Secret. It is advised to [create a DNS Group](#) prior to the import with default parameters and NS records to be inherited by the imported records.

Additional Information:

System Information for Local Installations

Zones are stored in the 6connect web root under /zones.

DS keys are stored in the 6connect web root under /keys.

Global DNS Settings may be set from the [Admin Preferences](#) page.

Additional Sections:

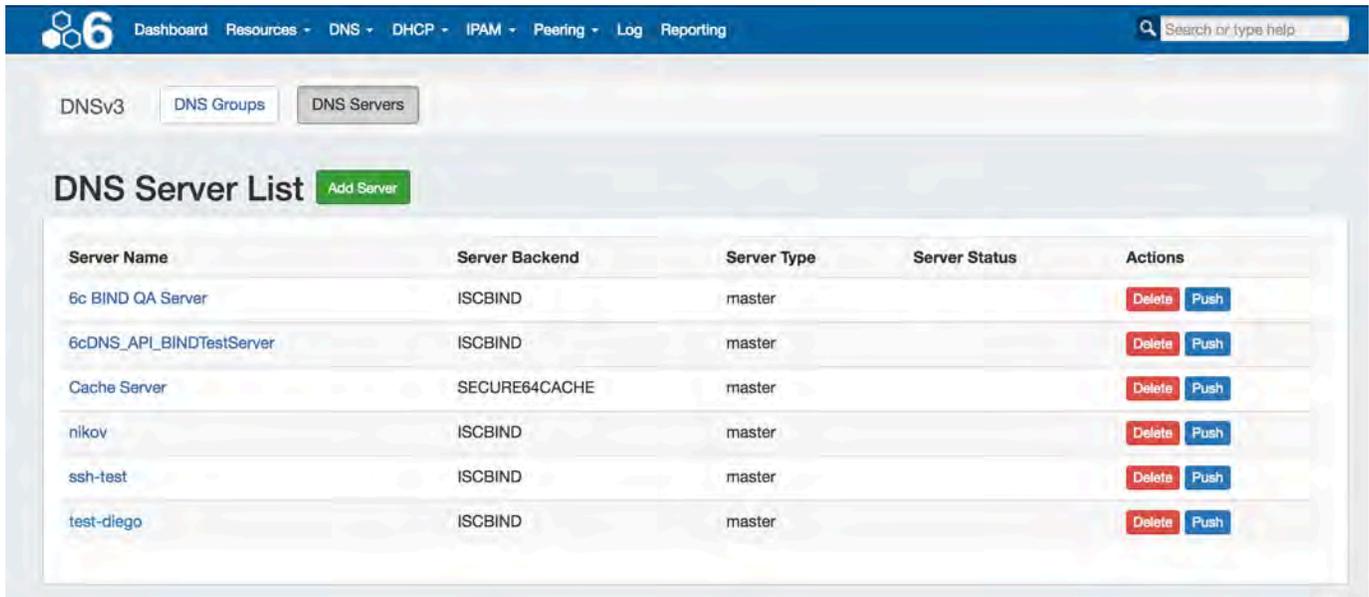

For more information on DNS and configurations, see the following sections:

Working with DNS Servers

DNS Servers

ProVision's DNSv3 combines server management, group organization, and zone management under the **DNS** tab.

The **DNS Servers** tab is only accessible to Admin users, and contains functions for adding, updating, and managing DNS servers as well as scheduling server tasks.

- DNS Servers
 - DNS Server List Interface
- Working with DNS Servers
 - Add a Server
 - Server Settings
 - 1) Set Server Common Settings
 - 2) Set Server Specific Settings
 - 3) Set DNS Group Settings for Server
 - 4) Save Changes
 - Edit Servers
 - Review Zones Connected to a Server
 - Zones Directly Connected to the Server
 - Zones Connected via a Group
 - Pushing a Server
 - Manual Push
 - Scheduled Push
 - Delete a Server

DNS Server List Interface

The screenshot shows the 'DNS Server List' page. At the top, there are tabs for 'DNSv3', 'DNS Groups', and 'DNS Servers'. Below the tabs is the title 'DNS Server List' followed by a green 'Add Server' button. The main content is a table with the following columns: Server Name, Server Backend, Server Type, Server Status, and Actions. The table contains six rows of server data.

Server Name	Server Backend	Server Type	Server Status	Actions
6c BIND QA Server	ISCBIND	master		Delete Push
6cDNS_API_BINDTestServer	ISCBIND	master		Delete Push
Cache Server	SECURE64CACHE	master		Delete Push
nikov	ISCBIND	master		Delete Push
ssh-test	ISCBIND	master		Delete Push
test-diego	ISCBIND	master		Delete Push

1) **Add Server Button:** Opens a dialog for creating a DNS server.

2) **Server List:**

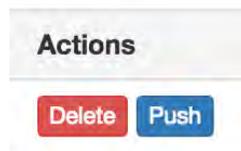

3) **Server Name:** Name of the DNS server. Click to open server details.

4) **Server Backend:** The DNS Service backend type for the server.

5) **Server Type:** Whether the server is a master or slave type.

6) **Server Status:** Currently a placeholder column for future display of server error and connection status messages.

7) **Actions:** The actions that may be performed on each server:

8) **Delete:** Deletes the server from ProVision.

9) **Push:** Pushes all zones associated with the selected server.

Working with DNS Servers

Add a Server

To create a new server, start from the [DNS](#) Tab, select the **DNS Servers** sub menu. Then, click the "Add Server" button next to "DNS Server List".

This will open the "Server Settings" page.

Server Settings

1) Set Server Common Settings

In the "Common Settings" section of Server Settings, enter the new server's Display Name (the name that will appear on the ProVision interface), the FQDN / IP, server type, service type, and desired parent Resource (may be left at the default Top Level Resource).

Common Settings

Display Name:
Enter Display Name
This is the server name that will appear in the DNS interface.

FQDN or IP:
ex: ns1.dns8connect.net or 216.239.32.10
DNS server real FQDN or IP Address.

Server Type:
Master

DNS Service:
ISC BIND

Parent Resource:
TLR
The new server resource will be a child of the Parent Resource.

Display Name: Name you want the server to display.

FQDN or IP: The FQDN or ip address of the DNS server.

Default: Specify if the server should be added to new zones by default or not.

Server Type: Specify if the server is a master or slave. Different configuration files are created master vs. slave on the Bind, PowerDNS/Bind, and Secure64 platforms.

DNS Service: Select the DNS service type (ISC Bind, Secure64, KnotDNS, etc).

Parent Resource: Select the ProVision resource to be the "parent" of the server - typically TLR (Top Level Resource), but may be a lower level resource such as a Customer or Location. The parent resource selection is the basis of access permissions for the server.

2) Set Server Specific Settings

The next section is entering server service-type specific settings. The options visible in this section will depend on the "DNS Service" type chosen under "Common Settings".

Here, we see the fields for ISC BIND server settings. Enter the server Username, Password, Port, Remote Director, Named Conf. Path, and Pre/Post Command (if desired). Your fields may vary for other server types.

For SSH Public Key Authentication, DNSSEC, and Dynamic Option updates, click on the ON / OFF toggle to select "ON" or "OFF" for each as needed.

ISC BIND Settings Test Server

SSH Public Key Authentication: OFF

Please choose your SSH authentication type.

Username:

 Username for the SSH connection. It must have write access to the Bind configurations and zone folders. Bind must also have write permissions to the files that are created with the user.

Password:

Port:

 Server SSH Port.

Remote Directory:

 Path to the remote server where to store the generated zone files.

Named Conf Path:

 Path to the named.conf config.

Pre Command:

Post Command:

Enable DNSSEC: ON

Enable Dynamic Updates: ON

SSH Public Key Authentication: If applicable, toggle "On" or "Off"

Username: Login/username for the target DNS server. The specified account needs to be valid, and have write permission to the remote directory and execute permission for any pre/post commands.

Password: Password for the target account. All passwords are stored encrypted in the database.

Port: Port to contact the target server on. This is port used for SSH on Bind and Secure64 server types.

Remote Directory: The target directory to transfer zone files to on the DNS system.

Named Conf Path: The path to other zones on the Bind systems.

Pre Command: Any valid system command on the target DNS system. This command will be run before any files are transferred.

Post Command: Any valid system command on the target DNS system. This command will be run after any files are transferred. For example, on a Bind system you would need to run "rndc reload" to reload the zones.

Enable DNSSEC: If available for the server type, toggle to "On" or "Off". See Configuring DNSSEC for additional information.

Enable Dynamic Updates: Toggle to "On" or "Off", if the server allows dynamic updates.

After entering the server-specific settings in this section, you can click the "Test Server" button at the top of the section to test the server connection and authentication.

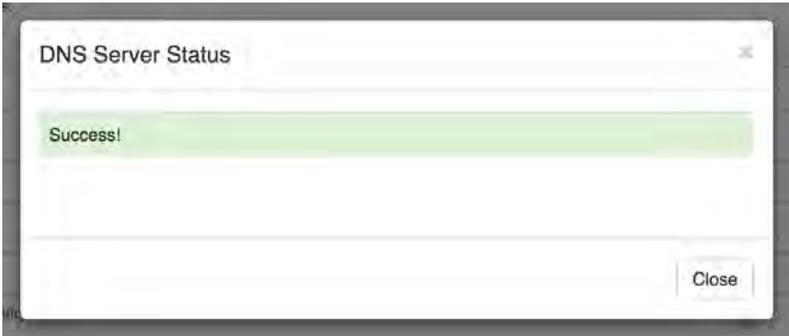

The "Test Server" button will attempt to login to the target system and write to the target directory.

ISC BIND Settings

Test Server

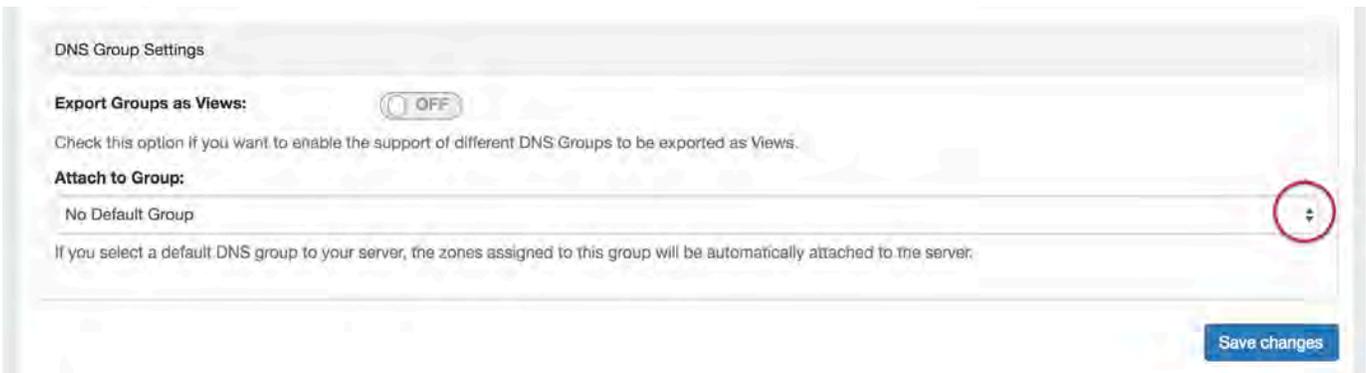

A window will pop up showing a success or failure response.

If any failures are encountered, an error will be written with some detail. If the test is successful, the word "Success!" will show verifying that files can be transferred. This does not test if the user can execute pre/post commands. This needs to be checked manually.

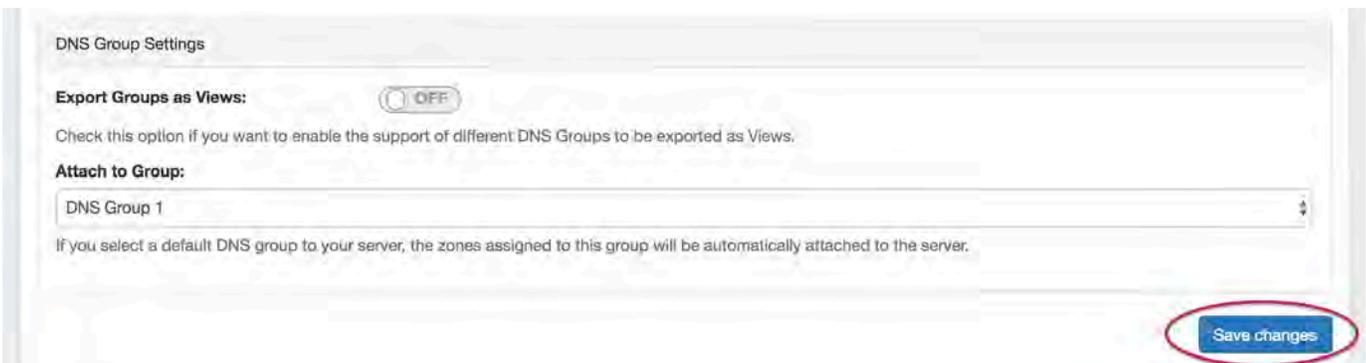

3) Set DNS Group Settings for Server

In the last section, select whether to enable support for exporting DNS Groups as Views (click to toggle ON / OFF), and select a default Group, if desired, to be associated with the server. Zones assigned to the selected Group will automatically be attached to the server.

4) Save Changes

Save your changes when done! Just click the "Save Changes" button at the bottom right of the page.

The new server will now be added to the DNS Servers list. These settings may be changed at any time by selecting the server from the server list and editing the information.

Edit Servers

Edit an existing server by clicking once on the server name in the DNS Servers list.

The "Server Settings" page will open.

Server Settings : Example server

Push Zones Schedule Push

Common Settings

Display Name:
Example server
This is the server name that will appear in the DNS interface.

FQDN or IP:
ns1.dns.example.com.
DNS server real FQDN or IP Address.

Server Type:
Master

DNS Service:
ISC BIND

Parent Resource:
The new server resource will be a child of the Parent Resource.

Click inside the field that you want to change, type your changes, and then click "Save Changes" at the bottom of the page.

DNS Group Settings

Export Groups as Views: OFF
Check this option if you want to enable the support of different DNS Groups to be exported as Views.

Attach to Group:
DNS Group 1
If you select a default DNS group to your server, the zones assigned to this group will be automatically attached to the server.

Save changes

Review Zones Connected to a Server

There are two ways that zones may be connected to a DNS server:

1) Directly connected, by attaching the zone to a server from the View Zone page.

or,

2) Connected by a Group that has been set as the default DNS Group for the server, selected under "DNS Group Settings".

Both are able to be viewed on the DNS Server Settings page.

To view either, open the Server Settings page for the server by clicking on the server name in the DNS Servers list.

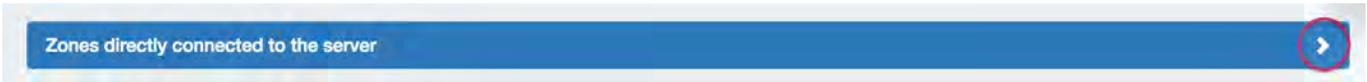

Edit an existing server by clicking once on the server name in the DNS Servers list.

The "Server Settings" page will open.

Zones Directly Connected to the Server

Scroll to the bottom of the page, and open the module titled "Zones directly connected to the server" by clicking on the expansion arrow.

A zone list will show the zone(s) that have been directly connected to this server.

Here, you may browse through forward and reverse zones by selecting the "Forward Zones" or "Reverse Zones" tabs, sort the list by Zone Name or Last Modified, open the zone's page by clicking on the name, or check the zone's status by clicking the "Check" button.

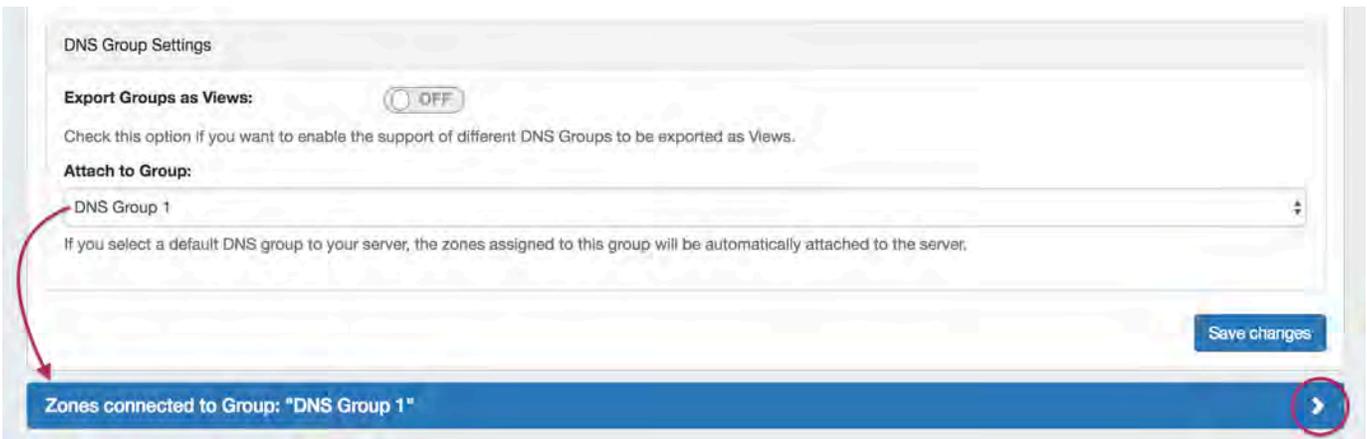

Zones may be exported by clicking the "Export Zones" button.

Zones Connected via a Group

If a default Group has been selected under "DNS Group Settings" for the server, Zones under that Group will be connected to the server and able to be viewed on the Server Settings page.

Scroll to the bottom of the page, and open the module titled "Zones connected to Group '(Group Name)' " by clicking on the expansion arrow.

A zone list will show the zone(s) that connected to this server via a selected Group.

Here, you may browse through forward and reverse zones in that Group by selecting the "Forward Zones" or "Reverse Zones" tabs, sort the list by Zone Name or Last Modified, open the zone's page by clicking on the name, or check the zone's status by clicking the "Check" button.

Zones connected to Group: "DNS Group 1"

Forward Zones		Reverse Zones			
Zone Name	Last Pushed	Last Modified	Records	Zone Status	Actions
msn.com.		02/24/2017 14:02:27	6		Check
msn2.com.		03/27/2017 14:21:58	4		Check

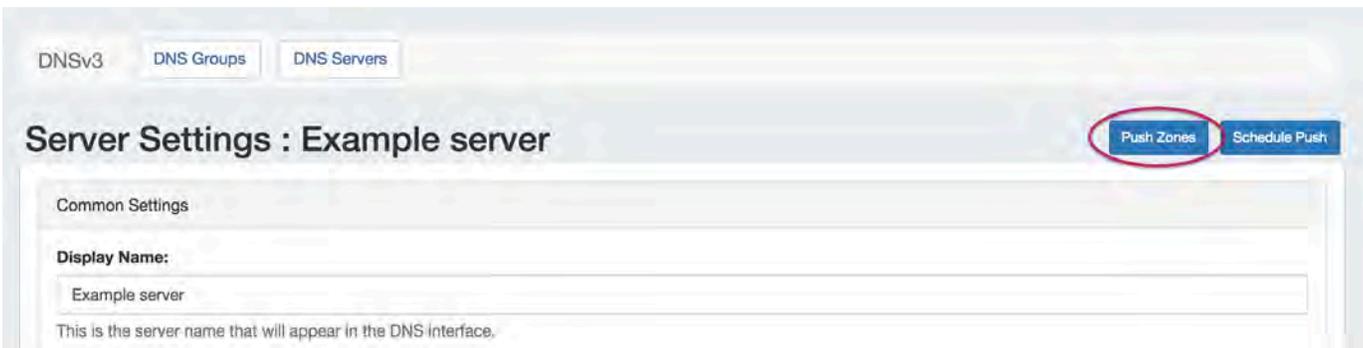

Pushing a Server

Manual Push

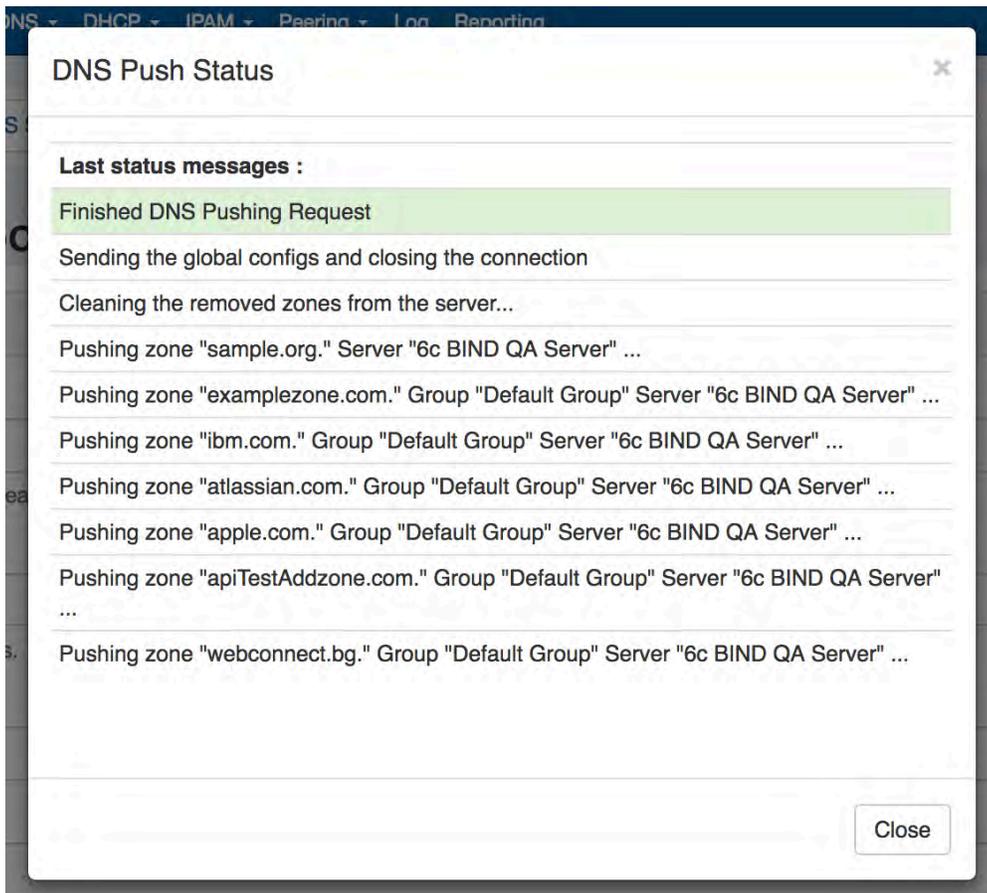

Manually pushing all zones on a server may be done directly from the DNS Server list. Under the "Actions" section of the Server List, click the "Push" button for the desired server.

Pushing may also be done while in the Server Settings page. While in the Server Settings page, click the "Push Zones" button at the top right of the page.

A "DNS Push Status" box will appear, showing the status of each zone as it is pushed. Once all zones have been pushed successfully, a green status message of "Finished DNS Pushing Request" will appear. At this point, the push is complete and the window may be closed.

Scheduled Push

DNS server pushes may be scheduled from either the Admin Area [Scheduler](#) Tab, or from within the DNSv3 Server Settings page. Scheduled pushes require Admin access.

For information on scheduling a push from the [Scheduler](#) Tab, see [Scheduler](#) documentation.

To schedule a push from a server's Settings page, open the Server Settings page for the desired server, and click on the "Schedule Push" button.

The Push Scheduler dialog will open. Click on the calendar on the left to select a date for the push, set the desired push time on the right, enter a notification email address, and then click "Save Changes".

Push Scheduler ✕

Pick date and time (America/Los_Angeles):

March 2017

Su	Mo	Tu	We	Th	Fr	Sa
26	27	28	1	2	3	4

Notification Email:

Close Save changes

Once a schedule push has been created, a "Scheduled Tasks" module will appear at the top of the Server Settings page.

Click on the expansion arrow for the module to open and view the tasks.

Scheduled pushes for the server will be listed in the "Scheduled Tasks" module, and may be viewed or deleted (by clicking the "Delete" button under "Actions").

Task Name	Last Run	Repeat Time	Actions
Scheduled Push: Example server		One time on 2017-03-27 at 19:30 PDT	Delete

If necessary, the Scheduled Push may be edited from the [Scheduler](#) Tab in the Admin area of ProVision. See the [Scheduler](#) for information on editing scheduled tasks.

Delete a Server

Delete a server by clicking the "Delete" button under the "Actions" section of the Server List for the desired server.

Configuring ISC BIND Support

Configuring ISC BIND Support

- Configuring ISC BIND Support
 - Getting Started
 - Adding a BIND Server to ProVision
 - Server Settings
 - 1) Set Server Common Settings
 - 2) Set Server Specific Settings
 - 3) Set DNS Group Settings for Server
 - 4) Save Changes

Getting Started

You will need a user who can log in to the DNS server and make changes to the directory in which the zones are being stored. Additionally, it is often useful for this user to have the ability to restart the DNS server. The login and password for this user will be required to configure this server on the DNS Admin page.

6connect Zone files are written out in the following format:

```
/path/to/zone/directory/viewName/zoneFirstLetter/zonefile.zone
```

If no views are configured, or if views are expressly disabled, then the default viewName "6connectGeneric" is used. The zoneFirstLetter is the first letter of the zone name, so the subdirectory 'microsoft.com.zone' is placed in would be /m/.

All 6connect-managed Zones are managed by a dedicated 6connect configuration file named 6connect_named.conf. This file is created to act a supplementary conf file to work in concert with any existing named.conf which might exist. To include the 6connect configuration file, edit named.conf and append the following line:

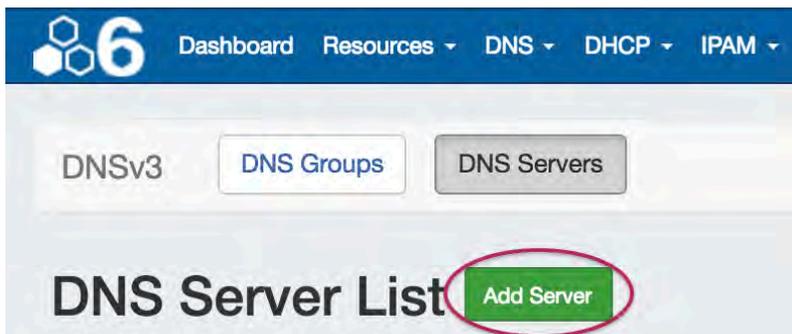

```
include "/path/to/conf/directory/6connect_named.conf";
```

You must remember to include the 6connect configuration file or none of the changes managed by 6connect ProVision will take effect!

It is also important to note that if your existing named.conf file contains zones within Split Horizon views, then the 6connect-managed zones must also be view-enabled. Likewise, if existing zones are not grouped into views, then views must be disabled on ProVision.

Adding a BIND Server to ProVision

To create a new server, start from the [DNS](#) Tab, select the **DNS Servers** sub menu. Then, click the "Add Server" button next to "DNS Server List".

This will open the "Server Settings" page.

Server Settings

1) Set Server Common Settings

In the "Common Settings" section of Server Settings, enter the new server's Display Name (the name that will appear on the ProVision interface), the FQDN / IP, server type, service type, and desired parent Resource (may be left at the default Top Level Resource).

Common Settings

Display Name:
Enter Display Name
This is the server name that will appear in the DNS interface.

FQDN or IP:
ex: ns1.dns.bconnect.net or 218.239.32.10
DNS server real FQDN or IP Address.

Server Type:
Master

DNS Service:
ISC BIND

Parent Resource:
TLR
The new server resource will be a child of the Parent Resource.

2) Set Server Specific Settings

The next section is entering server service-type specific settings. The options visible in this section will depend on the "DNS Service" type chosen under "Common Settings".

Here, we see the fields for ISC BIND server settings. Enter the server Username, Password, Port, Remote Director, Named Conf. Path, and Pre/Post Command (if desired). Your fields may vary for other server types.

For SSH Public Key Authentication, DNSSEC, and Dynamic Option updates, click on the ON / OFF toggle to select "ON" or "OFF" for each as needed.

ISC BIND Settings **Test Server**

SSH Public Key Authentication: OFF

Please choose your SSH authentication type.

Username:

 Username for the SSH connection. It must have write access to the Bind configurations and zone folders. Bind must also have write permissions to the files that are created with the user.

Password:

Port:

 Server SSH Port.

Remote Directory:

 Path to the remote server where to store the generated zone files.

Named Conf Path:

 Path to the named.conf config.

Pre Command:

Post Command:

Enable DNSSEC: ON

Enable Dynamic Updates: ON

After entering the server-specific settings in this section, you can click the "Test Server" button at the top of the section to test the server connection and authentication.

A window will pop up showing a success or failure response.

3) Set DNS Group Settings for Server

In the last section, select whether to enable support for exporting DNS Groups as Views (click to toggle ON / OFF), and select a default Group, if desired, to be associated with the server. Zones assigned to the selected Group will automatically be attached to the server.

DNS Group Settings

Export Groups as Views: OFF

Check this option if you want to enable the support of different DNS Groups to be exported as Views.

Attach to Group:

No Default Group

If you select a default DNS group to your server, the zones assigned to this group will be automatically attached to the server.

Save changes

4) Save Changes

Save your changes when done! Just click the "Save Changes" button at the bottom right of the page.

DNS Group Settings

Export Groups as Views: OFF

Check this option if you want to enable the support of different DNS Groups to be exported as Views.

Attach to Group:

DNS Group 1

If you select a default DNS group to your server, the zones assigned to this group will be automatically attached to the server.

Save changes

The new server will now be added to the DNS Servers list. These settings may be changed at any time by selecting the server from the server list and editing the information.

Configuring PowerDNS Support

Configuring PowerDNS Support

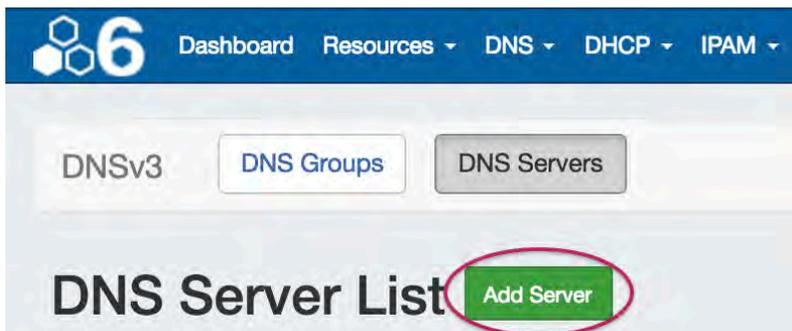

- Configuring PowerDNS Support
 - Environments supported
 - Step 1: Add a PowerDNS Server
 - Server Settings
 - 1) Set Server Common Settings
 - 2) Set Server Specific Settings
 - 3) Set DNS Group Settings for Server
 - 4) Save Changes
 - Step 2: Import PowerDNS Zones
 - Step 3: Push zones to PowerDNS
 - BIND Backend
 - MySQL Backend

Environments supported

- PowerDNS version 3.0 or above on the target server(s)
- BIND or MySQL backend

Step 1: Add a PowerDNS Server

To create a new server, start from the [DNS](#) Tab, select the **DNS Servers** sub menu. Then, click the "Add Server" button next to "DNS Server List".

This will open the "Server Settings" page.

Server Settings

1) Set Server Common Settings

In the "Common Settings" section of Server Settings, enter the new server's Display Name (the name that will appear on the ProVision interface), the FQDN / IP, server type, DNS service type, and desired parent Resource (may be left at the default Top Level Resource). For PowerDNS servers, ensure that either "PowerDNS BIND" or "PowerDNS MySQL" is selected under DSN server type.

Common Settings

Display Name:
Enter Display Name
This is the server name that will appear in the DNS interface.

FQDN or IP:
ex: ns1.dns.bconnect.net or 216.239.32.10
DNS server real FQDN or IP Address.

Server Type:
Master

DNS Service:
PowerDNS Bind

Parent Resource:
TLR
The new server resource will be a child of the Parent Resource.

2) Set Server Specific Settings

The next section is entering server service-type specific settings. The options visible in this section will depend on the "DNS Service" type chosen under "Common Settings".

Here, we see the fields for PowerDNS BIND server settings. Enter the server Username, Password, Port, Remote Director, Named Conf. Path, and Pre/Post Command (if desired). Your fields may vary for other server types.

For SSH Public Key Authentication, DNSSEC, and Dynamic Option updates, click on the ON / OFF toggle to select "ON" or "OFF" for each as needed.

PowerDNS BIND Settings Test Server

SSH Public Key Authentication: OFF

Please choose your SSH authentication type.

Username:

Enter Username

Username for the SSH connection. It must have write access to the PowerDNS configurations and zone folders. PowerDNS must also have write permissions to the files that are created with the user.

Password:

Enter Password

Port:

22

Server SSH Port.

Remote Directory:

/etc/powerdns/6c-zones

Path to the remote server where to store the generated zone files.

Named Conf Path:

/etc/powerdns/6connect_named.conf

Path to the named.conf config.

Pre Command:

Post Command:

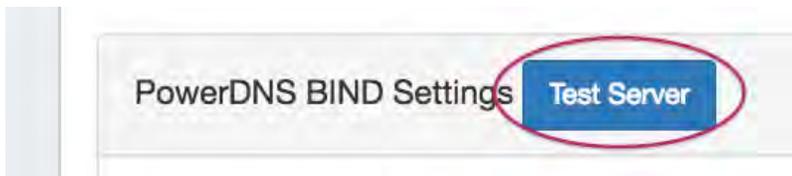

slc pdns_control rediscover

Enable DNSSEC: ON

Enable Dynamic Updates: ON

In order to support Dynamic DNS Update you must have PowerDNS version 3.4.0 or bigger. You must set "allow-dnsupdate-from=Provision_IP" and "dnsupdate=yes" or "experimental-dnsupdate=yes" depending on your version.

After entering the server-specific settings in this section, you can click the "Test Server" button at the top of the section to test the server connection and authentication.

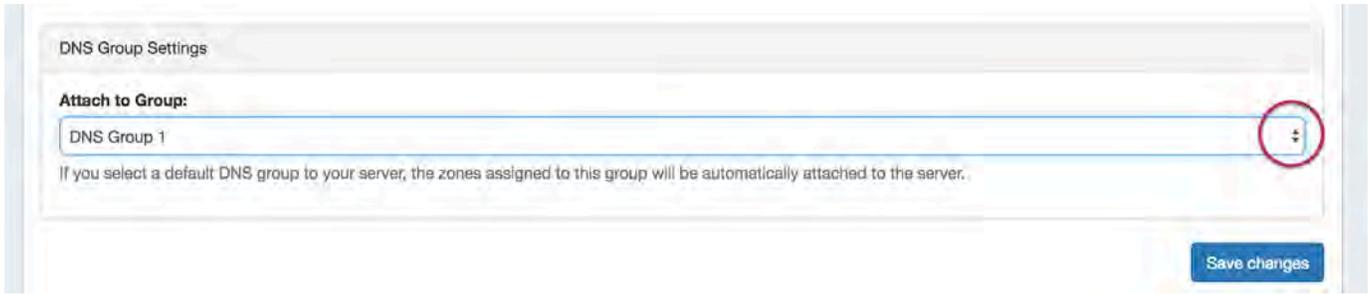

A window will pop up showing a success or failure response.

3) Set DNS Group Settings for Server

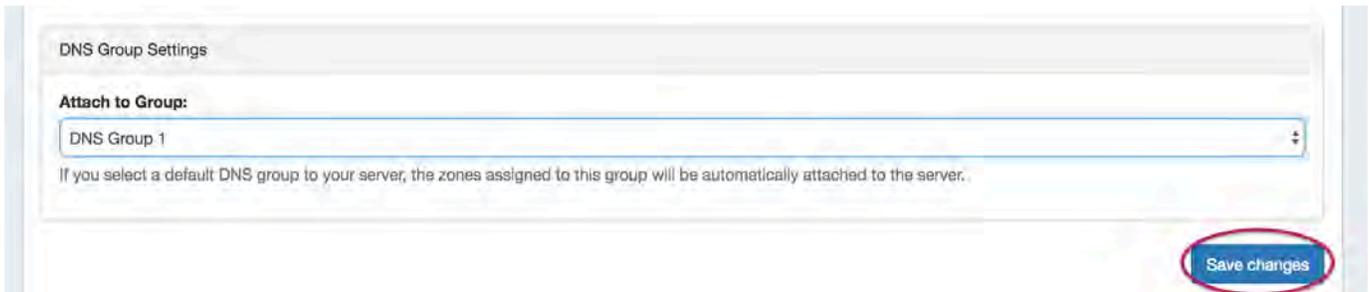

In the last section, select a default Group to be associated with the server. Zones assigned to the selected Group will automatically be attached to

the server.

4) Save Changes

Save your changes when done! Just click the "Save Changes" button at the bottom right of the page.

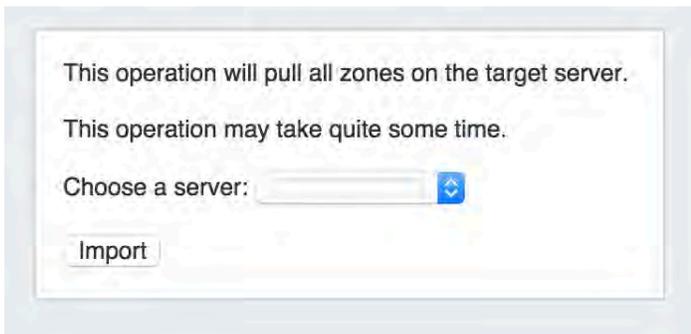

The new server will now be added to the DNS Servers list. These settings may be changed at any time by selecting the server from the server list and editing the information.

Step 2: Import PowerDNS Zones

While in the [Admin](#) section, navigate to the [Data Import](#) Tab. Select the "Power DNS Zone Import" link.

To import your data, simply choose your PowerDNS server and click "Import".

Step 3: Push zones to PowerDNS

Navigate back to the [DNS](#) tab, and select the "DNS Servers" tab.

Locate the PowerDNS server in the DNS Servers list, and then click the "Push" button under "Actions" at the end of the row.

6c PowerDNS	PDNSMYSQL	master	Delete	Push
-------------	-----------	--------	--------	------

BIND Backend

Note on SSH

The integration does not require a remote database connection, but it does require an SSH account and a writable directory. The SSH

account must have access to the server. This account will also be used for DNSSEC functionality within PowerDNS.

MySQL Backend

Note on SSH

The integration requires a remote database connection, so will need a mysql user with permissions for remote administration. We highly recommend using ACLs to ensure that configuration only occurs from intended sources.

For DNSSEC functionality, you will need a standard SSH user account withing your PowerDNS user group

Please note that Views are not supported with the MySQL backend

Only BIND and MySQL backends are supported.

Configuring Secure64 Support

Configuring Secure64 Support

- Configuring Secure64 Support
 - Step 1: Create an nsd.conf file under the root directory / of your S64 Auth server
 - Step 2: Make a directory for 6connect ProVision to push zone files to on the Secure64 DNS Server
 - Step 3: Setup and Configure 6connect ProVision for your Secure64 DNS Server
 - Server Settings
 - 1) Set Server Common Settings
 - 2) Set Server Specific Settings
 - 3) Set DNS Group Settings for Server
 - 4) Save Changes
 - Step 4: Associate zones to your Secure64 DNS Server(s)
 - Step 5: Push Zones to Secure64 Server(s)
 - Step 6: Verify DNS Zone push on Secure64 Server(s)
 - Step 7: Validate Zone data in Your Infrastructure

A note on Ports

6connect uses port 22 to communicate with Secure64 infrastructure - please ensure that this is addressed in any ACLs/firewalls

The initial setup of the Secure64 Authoritative server is as follows:

Step 1: Create an nsd.conf file under the root directory / of your S64 Auth server

DO THIS

Make sure to add the line include: 6connect_nsd.conf to the nsd.conf file

Output/Input

```
[authdnsadmin@Secure64DNS]# cat nsd.conf
server:
ip-address: 50.198.192.141

axfr-logfile: /axfr_log/axfr.log
axfr-logfile-flush-count: 1
axfr-logfile-max-size: 100000
axfr-logfile-max-size: 10

request-logfile: /request_log/request.log
request-logfile-flush-count: 10
request-logfile-max-size: 1000000
request-logfile-max-files: 10

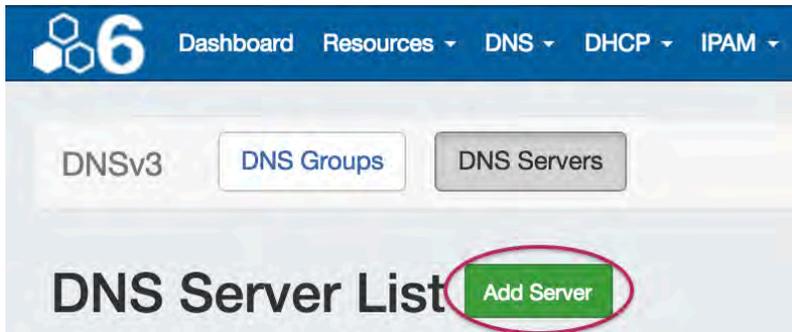

include: 6connect_nsd.conf
```

Step 2: Make a directory for 6connect ProVision to push zone files to on the Secure64 DNS Server

```
[authdnsadmin@Secure64DNS]# mkdir test12
[authdnsadmin@Secure64DNS]# ls
/:
322 2013-08-19 06:07:42 nsd.conf
<DIR> 1024 2013-08-16 17:30:12 test12
```

Step 3: Setup and Configure 6connect ProVision for your Secure64 DNS Server

To create a new server, start from the [DNS](#) Tab, select the **DNS Servers** sub menu. Then, click the "Add Server" button next to "DNS Server List".

This will open the "Server Settings" page.

Server Settings

1) Set Server Common Settings

In the "Common Settings" section of Server Settings, enter the new server's Display Name (the name that will appear on the ProVision interface), the FQDN / IP, server type, DNS service type, and desired parent Resource (may be left at the default Top Level Resource). For Secure64 servers, ensure that DNS Service is set to "Secure64 Authority", "Secure64 x86 Authority", "Secure64 KNOT Authority", or "Secure64 Cache".

The image shows the 'Common Settings' form for configuring a DNS server. It contains several fields with red arrows pointing to them: 'Display Name' (with a placeholder 'Enter Display Name'), 'FQDN or IP' (with a placeholder 'ex: ns1.dns.6connect.net or 216.299.32.10'), 'Server Type' (set to 'Master'), 'DNS Service' (set to 'Secure64 Authority'), and 'Parent Resource' (set to 'TLR'). Each field has a small help icon to its right.

2) Set Server Specific Settings

The next section is entering server service-type specific settings. The options visible in this section will depend on the "DNS Service" type chosen under "Common Settings".

Here, we see the fields for Secure64 server settings.

Enter the server Username, Password, Port, Remote Directory, Named Conf. Path, and whether to enable SNMP.

For SSH Public Key Authentication and Dynamic Option updates, click on the ON / OFF toggle to select "ON" or "OFF" for each as needed.

After entering the server-specific settings in this section, you can click the "Test Server" button at the top of the section to test the server connection and authentication.

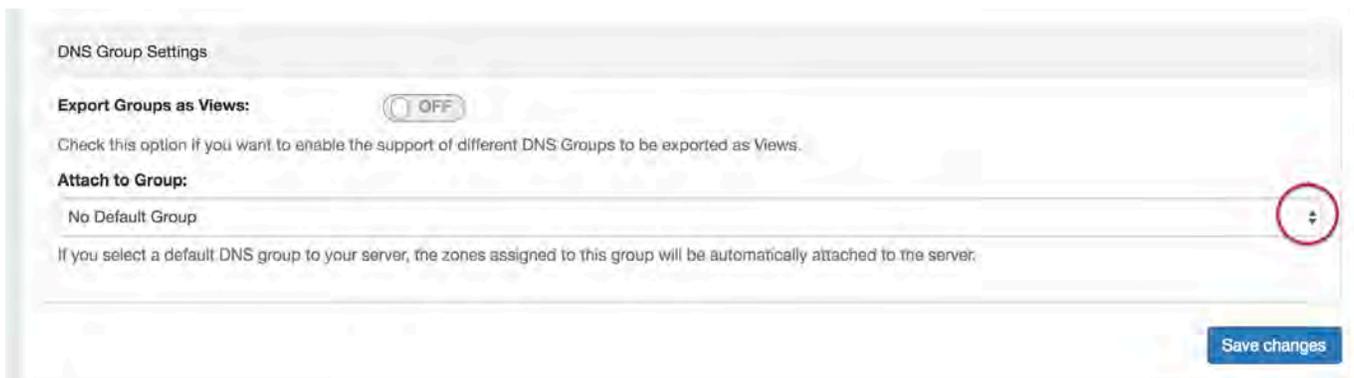

A window will pop up showing a success or failure response.

3) Set DNS Group Settings for Server

In the last section, select whether to enable support for exporting DNS Groups as Views (click to toggle ON / OFF), and select a default Group, if desired, to be associated with the server. Zones assigned to the selected Group will automatically be attached to the server.

DNS Group Settings

Export Groups as Views: OFF

Check this option if you want to enable the support of different DNS Groups to be exported as Views.

Attach to Group:

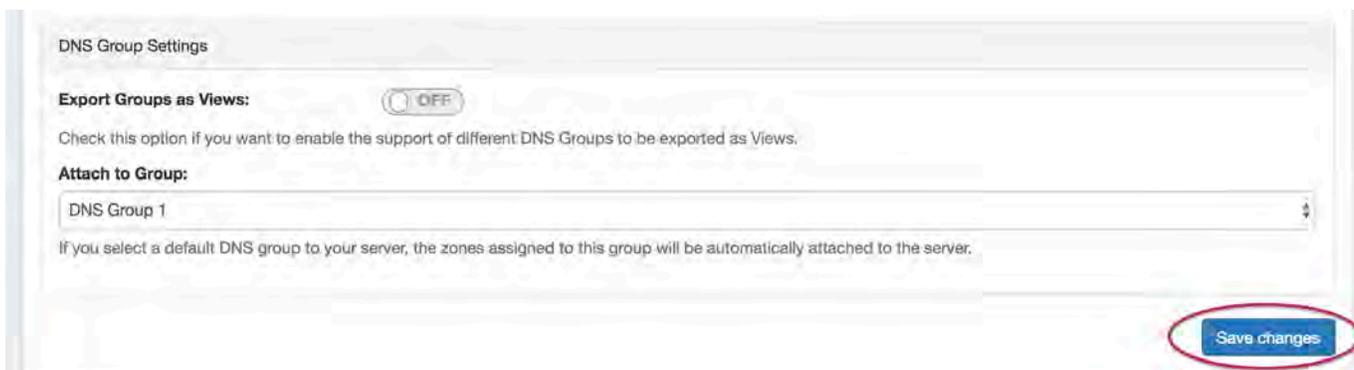

No Default Group

If you select a default DNS group to your server, the zones assigned to this group will be automatically attached to the server.

Save changes

4) Save Changes

Save your changes when done! Just click the "Save Changes" button at the bottom right of the page.

DNS Group Settings

Export Groups as Views: OFF

Check this option if you want to enable the support of different DNS Groups to be exported as Views.

Attach to Group:

DNS Group 1

If you select a default DNS group to your server, the zones assigned to this group will be automatically attached to the server.

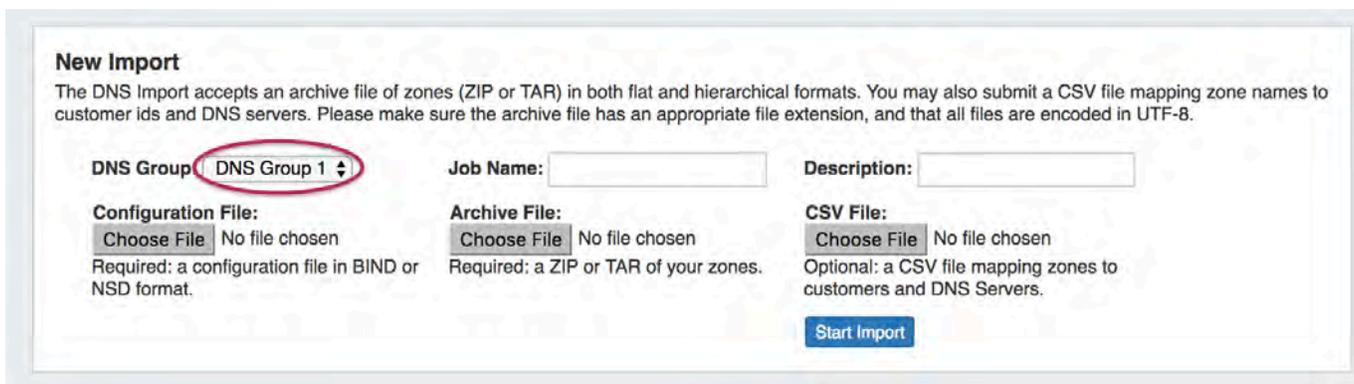

Save changes

Step 4: Associate zones to your Secure64 DNS Server(s)

If a default Group was selected while setting up the S64 server, then any zones in that Group will automatically be associated with the server.

Zones may be manually added, moved, or imported into the Group - see [Working with DNS Zones - Common Tasks](#) and [Working with DNS Groups](#) for details on associating zones with Groups.

If zones are to be imported, a DNS Group may be selected during the import process to associate with the zones.

New Import

The DNS Import accepts an archive file of zones (ZIP or TAR) in both flat and hierarchical formats. You may also submit a CSV file mapping zone names to customer ids and DNS servers. Please make sure the archive file has an appropriate file extension, and that all files are encoded in UTF-8.

DNS Group: DNS Group 1

Job Name:

Description:

Configuration File: No file chosen

Archive File: No file chosen

CSV File: No file chosen

Required: a configuration file in BIND or NSD format. Required: a ZIP or TAR of your zones. Optional: a CSV file mapping zones to customers and DNS Servers.

Start Import

Select the group specified as the default S64 server Group, then import the zones as described in the [Import DNS Zones](#) documentation.

Step 5: Push Zones to Secure64 Server(s)

Navigate back to the [DNS](#) tab, and select the "DNS Servers" tab.

Locate the Secure64 server in the DNS Servers list, and then click the "Push" button under "Actions" at the end of the row.

Step 6: Verify DNS Zone push on Secure64 Server(s)

The result of the Push can be checked/verified by checking the Secure64 server as follows:

Verifying Zone pushes

```
ssh to 50.198.192.141
Login using the designated login account and password
Enable cachednsadmin
ls
```

Now, verify that the "788 2013-08-21 12:35:04" 6connect_nsd.conf file now exists.

```
[authdnsadmin@eval138.secure64.com]# ls
/:
6728 2013-08-13 00:15:30 nsd.conf
8416071 2013-08-21 12:35:07 nsd.db
788 2013-08-21 12:35:04 6connect_nsd.conf
<DIR> 1024 2013-08-21 12:34:50 test12
```

You can verify the Push contents by doing a cat of the 6connect_nsd.conf

```
[authdnsadmin@Secure64DNS]# cat 6connect_nsd.conf
AutoGenerated by 6connect ProVision. Do not manually edit.

zone:

name: atestzone.com

zonefile: /test12/6connectGeneric/m/atestzone.com.zone

zone:

name: Testzone2.com

zonefile: /test12/6connectGeneric/m/Testzone2.com.zone
```

In the example above, two Zones have transferred.

To look at the contents of each zone you can cd to the proper directory /test12/6connectGeneric and find the zone files in an alphabetical directory structure as follows:

```
[authdnsadmin@Secure64DNS]# cd 6connectGeneric
[authdnsadmin@Secure64DNS]# cd test12
changed to test12
[authdnsadmin@Secure64DNS]# ls
/test12:
<DIR> 1024 2013-08-16 19:43:21 6connectGeneric
[authdnsadmin@Secure64DNS]# cd 6connectGeneric
changed to 6connectGeneric
[authdnsadmin@Secure64DNS]# ls
/test12/6connectGeneric/:
<DIR> 1024 2013-08-16 17:30:13 e
<DIR> 1024 2013-08-16 17:30:16 m
<DIR> 1024 2013-08-16 18:49:21 d
```

```
<DIR> 1024 2013-08-16 19:43:23 s
[authdnsadmin@Secure64DNS]# cd m
changed to m
[authdnsadmin@Secure64DNS]# ls
/test12/6connectGeneric/m/:
[authdnsadmin@eval138.secure64.com]# ls
5192 2013-08-21 15:35:01 atestzone.com.zone
6758 2013-08-21 15:35:02 Testzone2.com.zone
[authdnsadmin@Secure64DNS]#
```

Step 7: Validate Zone data in Your Infrastructure

Finally, do a **dig** of the zones to verify the DNS configuration has been successfully deployed.

Using dig to validate your Secure64 Server installation

```
[authdnsadmin@eval138.secure64.com]# dig @50.198.192.141 atestzone.com
; <<>> DiG SourceT 3.x <<>> @50.198.192.141 atestzone.com
;; Got answer:
;; >>HEADER<<< opcode: QUERY, status: NOERROR, id: 59591

For any questions regarding the integration of Secure64 products into 6connect ProVision, please email 6connect at support@6connect.com, or Secure64 at support@secure64.com

Configuring Split Horizon/Views

Configuring ACL Views

ProVision's ACL module applies the specified network lists to the in the named.conf for zones inside the group and the servers that belongs to the group, when exporting the group or zone.

- Configuring ACL Views
 - Create an ACL View
 - Edit an ACL
 - Delete an ACL
 - Add an existing ACL to another Group
 - Additional Information

WARNING

If you see a view named "_6connectDefault" - DO NOT DELETE IT.

Create an ACL View

ACL views may be created under each DNS Group, accessed from the [DNS](#) tab **DNS Groups** sub-tab.

Expand the Group that you want the view applied to, and then expand the section "Applied ACLs" by clicking on the expansion arrow to the right of the section name.

The screenshot shows the 'DNS Groups List' interface. At the top, there are tabs for 'DNSv3', 'DNS Groups', and 'DNS Servers'. Below the tabs is the title 'DNS Groups List' with an 'Add Group' button. A descriptive text states: 'DNS Groups help you to organize all of your Zones and Servers together into a single place. With Groups, you are able to push whole group configurations.'

There are two main sections: 'Default Group' and 'DNS Group 1'. The 'DNS Group 1' section is expanded, showing a 'DNS Zones' table with buttons for 'Add Zone', 'Push Group', and 'Schedule Push'. The table has columns for 'Zone Name', 'Last Pushed', 'Last Modified', 'Records', 'Zone Status', and 'Actions'. Two zones are listed: 'msn.com.' and 'msn2.com.'. The 'msn.com.' zone has a status of 'Contains Errors' and 6 records. The 'msn2.com.' zone has 4 records. Each zone has 'Delete', 'Push', 'Move', and 'Check' buttons.

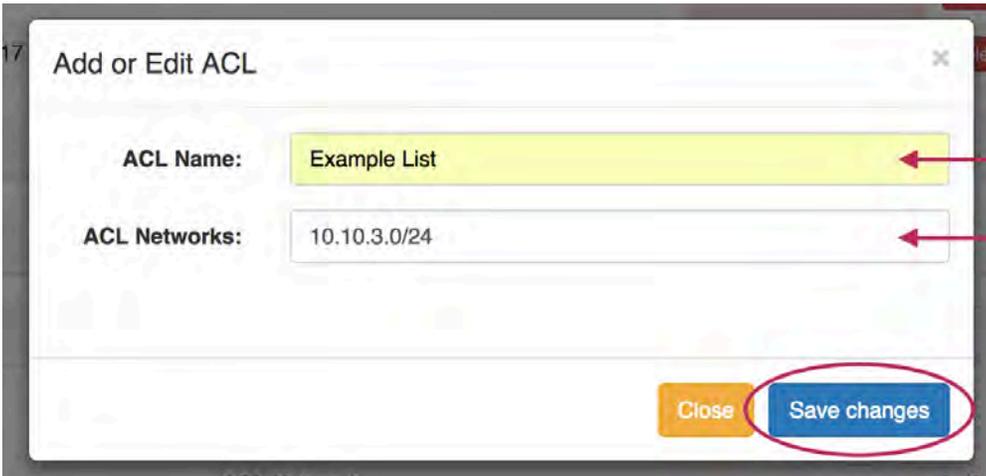

Below the table are sections for 'Attached Servers', 'Group Default Parameters', and 'Applied ACLs'. The 'Applied ACLs' section has an expansion arrow on the right, which is circled in red. There is also a red circle around the expansion arrow of the 'DNS Group 1' header.

If ACLs already exist, they will be shown under this section.

To add a new list, click the "Add or Edit ACL" button.

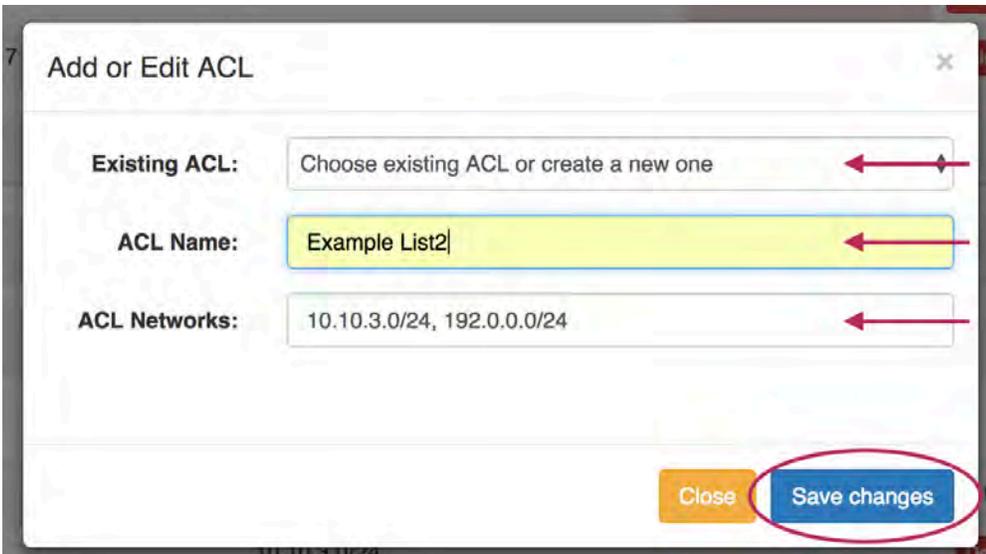

If no ACLs currently exist, the dialog will only show inputs for ACL Name and ACL Networks - enter a Name and Network and click "Save Changes".

If previous ACLs exist, a selector will be available for "Existing ACL:".

Since we are creating a new ACL, just keep this at the default value ("Choose Existing ACL or create a new one"), and enter in the Name and Network(s) for the new ACL. Separating multiple CIDRs with a comma (,).

When done, save the ACL by clicking "Save changes". The new ACL will be added to the Group's Applied ACL list.

Applied ACLs		
Add or Edit ACL		
ACL Name	ACL Networks	Actions
Example List	10.10.3.0/24	Detach
Example List2	10.10.3.0/24,192.0.0.0/24	Detach

Edit an ACL

ACLs may be edited similarly to how they are created. Click the "Add or Edit ACL" button under the "Applied ACLs" module for the DNS Group. Select the ACL you wish to edit from the "Existing ACL" Selector. Then, edit the Name or Network fields as desired.

When done, click "Save Changes".

Detach an ACL from a Group

Detaching an ACL removes it from the Group, but the ACL will still exist in ProVision for re-use in other Groups.

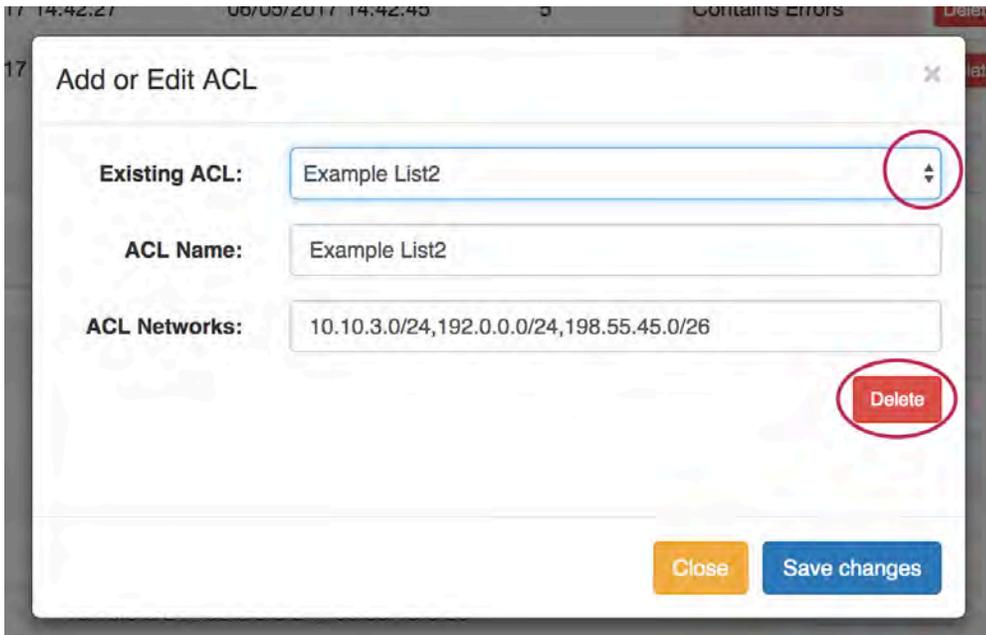

To detach an ACL, expand the "Applied ACLs" section under the desired Group, and click on the "Detach" button under the "Actions" column.

Applied ACLs		
Add or Edit ACL		
ACL Name	ACL Networks	Actions
Example List	10.10.3.0/24	Detach
Example List2	10.10.3.0/24,192.0.0.0/24,198.55.45.0/26	Detach

The ACL will be removed from under the Group, but will remain in other Groups it exists under, as well as be selectable from the "Add ACL" window.

Delete an ACL

ACLs may be deleted through the "Edit ACL" interface. Click the "Add or Edit ACL" button under the "Applied ACLs" module for the DNS Group. Select the ACL you wish to delete from the "Existing ACL" Selector. Then, click the red "Delete" button under the Networks field.

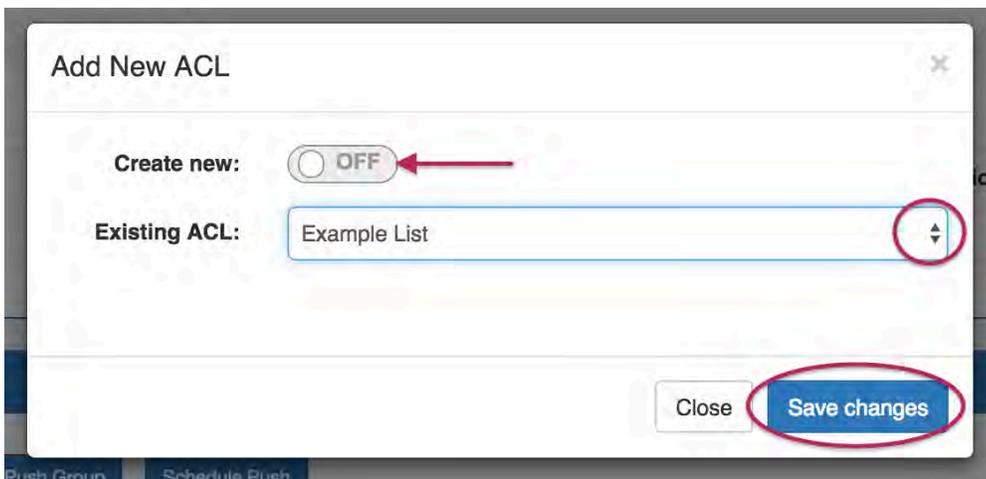

The ACL will be permanently deleted, and will no longer show under any Groups to which it has been attached, nor show in the "Existing ACLs" list.

Add an existing ACL to another Group

Existing ACLs may be added to as many Groups as desired. If ACLs already exist in ProVision, clicking the "Add ACL" button will give an additional option to "Create New".

To select a previously created ACL, turn the "Create New" toggle to the "OFF" position.

An "Existing ACL" list appears. Select the desired existing ACL from the list, and then click "Save changes" when done.

Additional Information

For more information on DNS Groups, Servers, and Zones, see:

DNS Tab

Working with DNS Groups

Working with DNS Zones - Common Tasks

DNS Administration

Working with DNS Servers

Configuring DNSSEC

Configuring DNSSEC

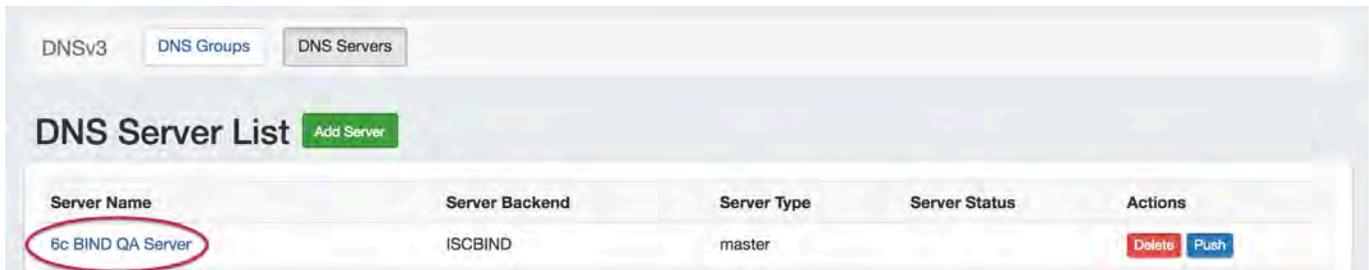

- Configuring DNSSEC
 - Enable DNSSEC for a Server (ProVision GUI)
 - Enable DNSSEC for a Zone (ProVision GUI)
 - Enabling DNSSEC (for a single zone)
 - Update Registrar and Confirm
 - For BIND server(s)
 - For Secure64 and PowerDNS

Enable DNSSEC for a Server (ProVision GUI)

DNSSEC may be enabled on a per-server basis in the ProVision DNS Server Settings.

Navigate to the [DNS](#) Tab, and select the **DNS Servers** section.

Find the desired server in the DNS Server List, and then click on the server name to open the settings for that server.

In the server settings page, scroll to the bottom of the second section, containing server-specific settings.

Near the bottom of the section is a toggle to "Enable DNSSEC" for the server; click the toggle to the "ON" position.

Enable DNSSEC for a Zone (ProVision GUI)

DNSSEC may be enabled on a per-zone basis in the ProVision Zone Advanced Settings.

Before you enable DNSSEC for a zone, make sure that do the following:

- Make sure DNSSEC is enabled on the DNS server(s) you will be pushing zones to (see "Enable DNSSEC for a Server", above)
- run **configTest.php** to make sure that your directories/permissions are correct
- Set external server for Authenticated Data verification
- Create/Edit a zone - see [Working with DNS Zones - Common Tasks](#) for additional information.
- Ensure that the zone is associated with a DNS server(s)

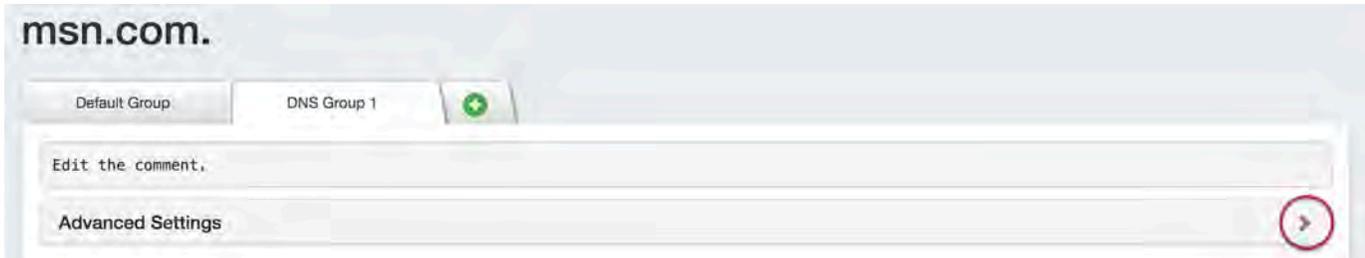

Enabling DNSSEC (for a single zone)

Navigate to the [DNS](#) Tab, and select the **DNS Groups** section.

Find the desired Group and Zone in the Groups List, and then click on the zone name to open the details for that zone.

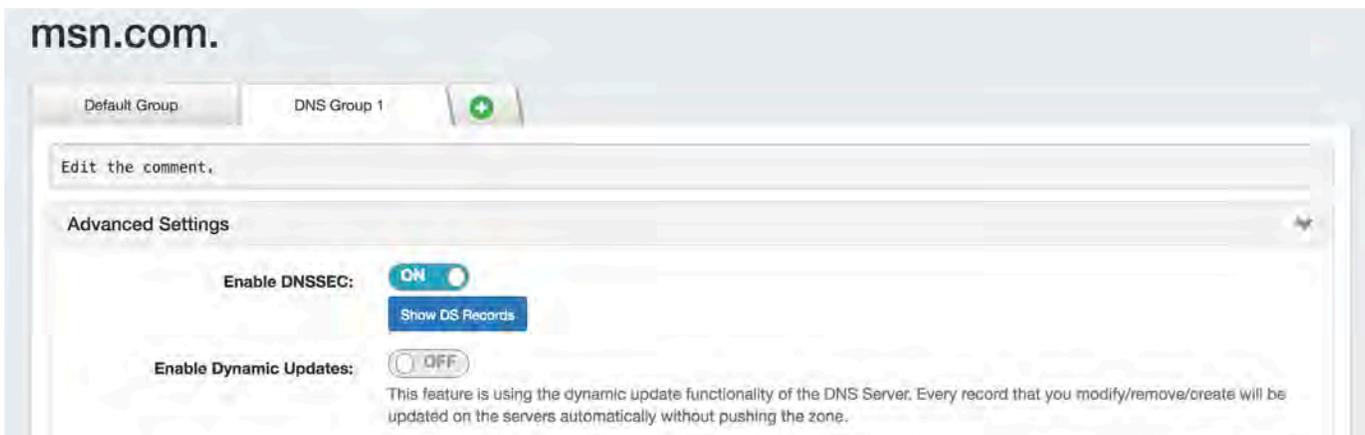

The view zone details page will open. Expand the zone details section "Advanced Settings" by clicking on the expansion arrow.

At the top of the "Advanced Settings" section will be a toggle to "Enable DNSSEC". Click the toggle to enable to the ON position.

Once enabled, the toggle will show as "ON", and a "Show DS Records" button will appear. At this point, no records exist, so clicking "Show DS Records" will result in a message telling you so.

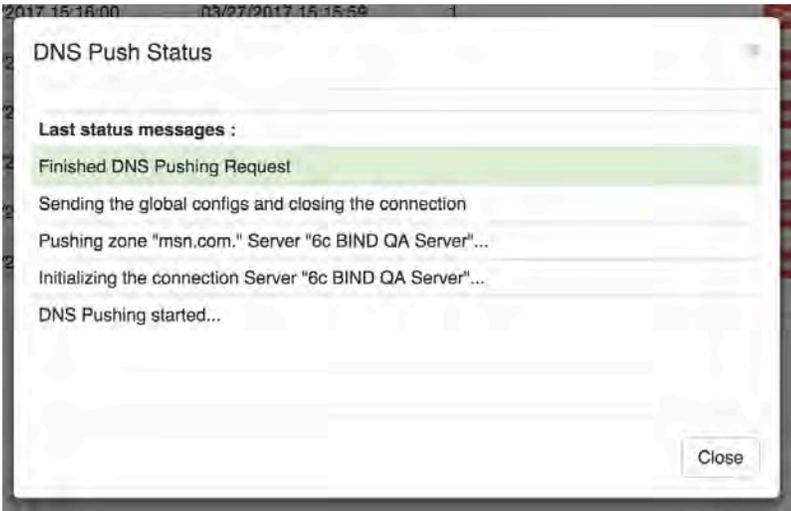

In order for DS Records to be created, the zone must be successfully pushed. Push the zone, Group, or Server containing the zone successfully and DS records will be created (see Working with DNS Zones - Common Tasks and Working with DNS Groups for details on how to schedule and push zones).

To quickly push just a single zone, go back to the DNS Groups section, and click on the "Push" button for the zone.

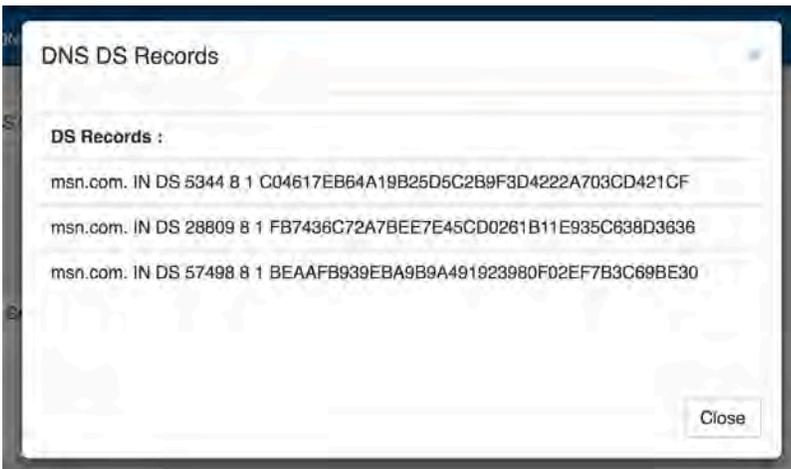

If successfully pushed, a green "Finished DNS Pushing Request" message will appear.

At this point, you will now have DS records available in the view zone details - Advanced Settings section. Open Advanced Settings for the zone and click on the "Show DS Records" button.

The DS records will be shown in a pop-up. Note these values for Registrar confirmation.

Update Registrar and Confirm

Once DS records have been created in ProVision, you will need to update and confirm the Zone Registrar:

- Upload these values to your Zone Registrar, obtained from the "Show DS Records" button
 - DS Record #, Key Tag, Algorithm, Digest Type, Digest
- Confirm values are saved at the Zone Registrar
- External sites
 - <http://dnssec-debugger.verisignlabs.com/>
 - <http://dnsviz.net/>

For BIND server(s)

To enable DNSSEC on BIND9 you need to modify **named.conf.options** with following parameters in the **options { }** section:

```
dnssec-enable yes;  
dnssec-validation yes;  
dnssec-lookaside auto;
```

These parameters may already be enabled in some Linux distributions by default, so please confirm before making changes.

Your DNSSEC implementation may need other options for your environment - please contact support@6connect.com if you have any

Please note that you will need to restart the BIND service after these changes.

For Secure64 and PowerDNS

DNSSEC Signatures

In this scenario, 6connect ProVision uses the DNSSEC signing functions of the respective environment we write the zones to. We are evaluating how to properly integrate DNSSEC functions to ProVision for these platforms. Please contact support@6connect.com if you have feedback or specific questions.

Importing Your Data

Preparing for Data Import

Before importing your data into ProVision, there are a few steps we recommend in order to make the import process as smooth as possible:

- Preparing for Data Import
 - Step 1: Normalize your Data
 - Step 2: Prep your Data
 - Step 3: Import your Data
- Data Import Overview: Which Import Tool Should I Use?
 - Resource Import
 - Import Templates
 - Peering Import
 - IP Import
 - DNS Import
 - Additional Information

Step 1: Normalize your Data

Prior to importing your data, there is a key step of Data Normalization to ensure that information is accurate. If you need assistance with parsing your data prior to importing, 6connect can help with our Data Analyst service. Email us at support@6connect.com for more information. You can also use off the shelf tools like Microsoft Excel, MySQL, or [Google Refine](#) if you intend to take on the task of data cleanup in house.

Data Encoding Format

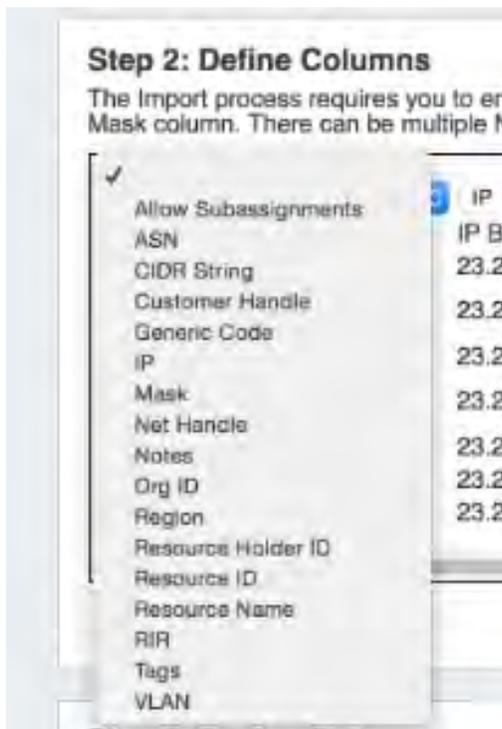

To ensure correct importing of any special characters, make sure to use UTF-8 encoding for your CSV file!

Step 2: Prep your Data

You can download data import templates from the [Dashboard Tab](#) or [Data Import Tab](#). We recommend that you open the [CSV import templates](#) and get familiar with the data fields that you can import into the platform.

- **For Company information** you can import relevant data including mailing/billing address information as well as ARIN specific SWIP fields, and specific DNS servers.
- **For Contact information** you can import contact records assigned to a given **Company**. We support typical fields for this data including Name, multiple email fields, phone numbers as well as Timezone and Role (Roles can be customized from the [IPAM Admin Tab](#)).
- **For IPv4 Block information** you can import the following fields:

✓ [Click here to expand...](#)

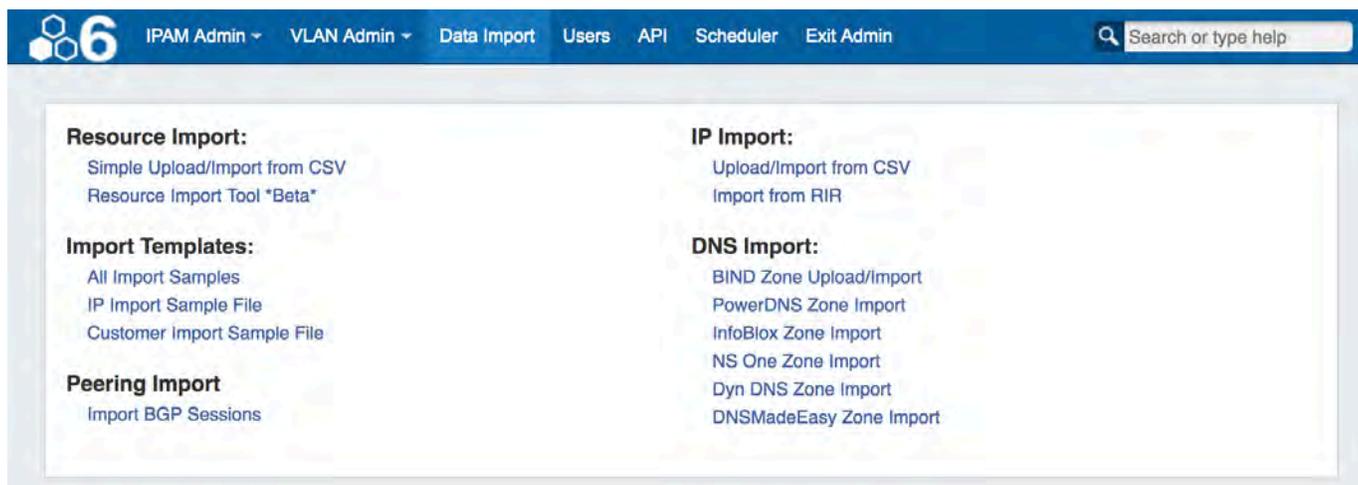

Allow Subassignments option

When importing the field "Allow Subassignments" - the parameters accepted are "TRUE", "1", "Y", "yes"

Step 3: Import your Data

Get to the [Data Import Tab](#) from the [Admin button](#) to import your data. For larger data import runs, feel free to [contact 6connect](#) at any time for assistance at support@6connect.com.

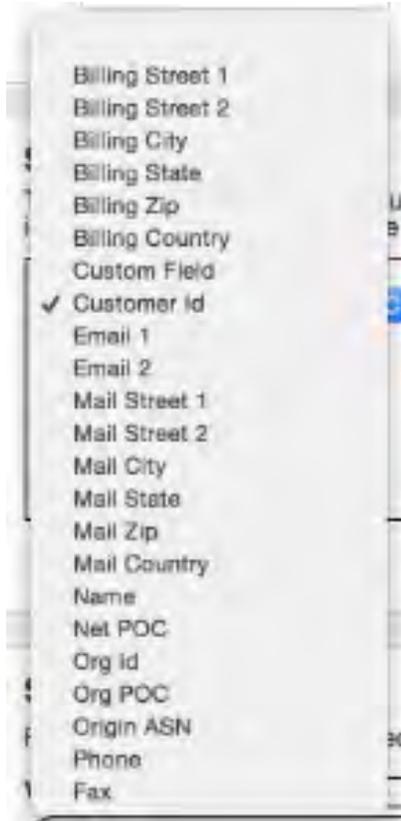

Data Import Overview: Which Import Tool Should I Use?

Resource Import

Simple Upload / Import from CSV: Use this tool if you have a simple .csv file of customer / contact information, such as Name, Address, Billing Address, Phone numbers, POC, etc. See [Resource Import from CSV](#) for more details.

This tool supports the following fields:

✓ [Click here to expand...](#)

Resource Import Tool: The Resource Import tool is designed for importing .csv files for any Resource type (company, physical devices, contacts, customers, etc), and allows for customized headers through integrating ProVision's [Section fields](#). It also allows for data editing within the tool. Use the Resource Import Tool if you have resource data that does not fit under the [Simple Upload / Import from CSV](#) field options, and can equate that data to an existing or newly created [Section](#).

Additional Information

A tutorial / walkthrough for this tool is available at the [Resource Import Tool](#) page.

Import Templates

This section links sample files for selected ProVision import tools. These may be viewed as an example of .csv setup for their respective importers, or used for tutorials.

They are:

All Import Samples - Links to the [CSV import templates](#) page of the documentation, showing all available import template .csv files.

IP Import Sample File - Download the [IP-import-sample_v1.csv](#) file, used in the [IP Import: Upload / Import from CSV](#) Tool.

Customer Sample Import - Download the [customer-import-sample.csv](#) file, used in the [Resource Import: Simple Upload / Import from CSV](#) Tool.

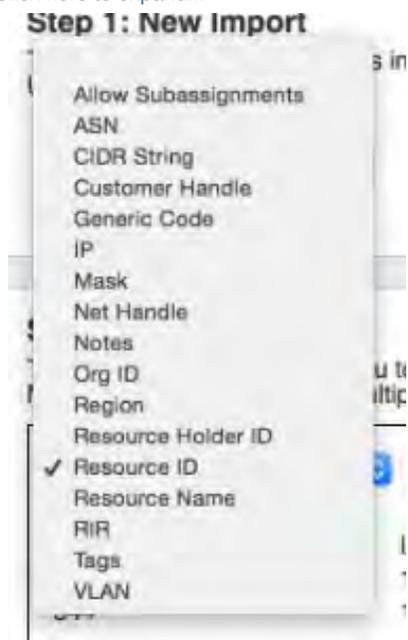

Peering Import

Import BGP Sessions: This section imports peering sessions from a selected exchange and router. Routers must be created prior to using this importer. See [Adding Routers](#) and [Importing Sessions](#) for additional information.

IP Import

Upload / Import from CSV: Use this tool if you have a .csv file of IP block information, such as CIDR, Mask, ASN, RIR, etc. This tool supports the following fields:

✓ [Click here to expand...](#)

Import from RIR: This tool automatically lookups your ARIN or RIPE information based on the IP address you are connected to. Once it identifies the blocks assigned to your company, you can import both 1918 aggregates as well as public IP space from ARIN and RIPE. See [Import Aggregate Blocks](#) for more detail on this tool.

DNS Import

BIND Zone Upload / Import: Imports DNS zones using the named.conf configuration file tied to the zones you are uploading, a .zip or .tar file of the zones themselves, and an optional .csv file mapping zones to customers and DNS Servers. This is the simplest and most commonly used import method. Refer to [Import DNS Zones](#) for more information.

PowerDNS Zone Import: This tool is available after [configuring a PowerDNS server](#) with a MySQL backend. The PowerDNS Import connects to the selected server and imports all zones.

InfoBlox Zone Import: Imports DNS zones using a provided Host, Username, and Password. The InfoBlox import pulls all zones on the InfoBlox LOCAL grid and adds them to a designated Group. It is advised to [create a DNS Group](#) prior to the import with default parameters and NS records to be inherited by the imported records.

NS ONE Zone Import: Imports DNS zones using a NS One API Key. It is advised to [create a DNS Group](#) prior to the import with default parameters and NS records to be inherited by the imported records.

Dyn DNS Zone Import: Imports DNS zones using a Dyn DNS Customer Name, Username, and Password. It is advised to [create a DNS Group](#) prior to the import with default parameters and NS records to be inherited by the imported records.

DNSMadeEasy Zone Import: Imports DNS zones using a DNSMadeEasy API Key and API Secret. It is advised to [create a DNS Group](#) prior to the import with default parameters and NS records to be inherited by the imported records.

Additional Information

For more details, see:

- [Resource Import from CSV](#)
- [Resource Import Tool](#)
- [Import Sessions](#)
- [IP Import from CSV](#)
- [Import Aggregate Blocks](#)
- [Import DNS Zones](#)

Resource Import from CSV

Simple Upload / Import from CSV

The [Simple Upload / Import from CSV](#) tool is used if you have a simple .csv file with customer / contact information, such as Name, Address, Billing Address, Phone numbers, POC, etc. It is accessed from the [Data Import Tab](#) from the [Admin](#) section of ProVision.

To import your customer / contact information, follow the following steps:

- Before you Begin: Prepare your Data for Import
- Step 1: Create a new Resource / Customer Import Job
- Step 2: Define Columns
- Step 3: Reviewing Data
- Step 4: Execute Import

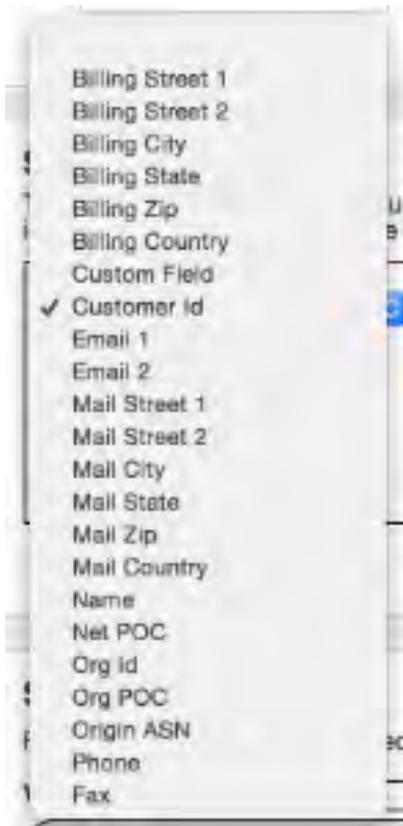

Before you Begin: Prepare your Data for Import

The [Simple Upload / Import from CSV](#) tool requires only a .csv file for importing.

Be sure to review "Preparing Data for Import" on the [Importing your Data](#) page before you begin. Verify that your .csv is correctly parsed and cleanly formatted with your customer/contact information (using your choice of the available field list shown below), and is UTF-8 encoded for best results.

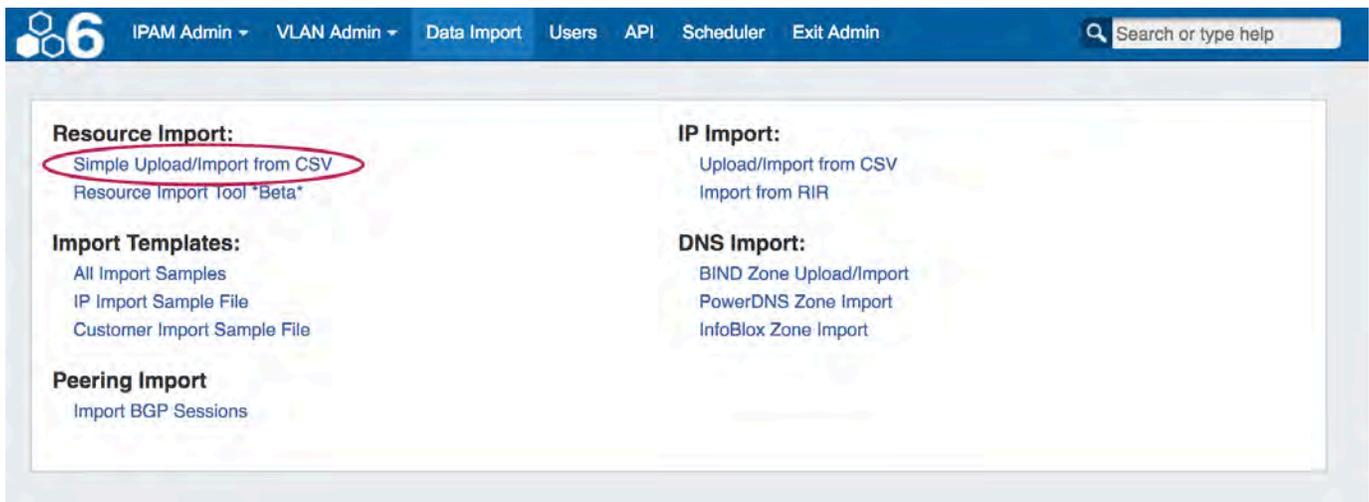

This tool supports the following fields:

✓ [Click here to expand...](#)

Step 1: Create a new Resource / Customer Import Job

Navigate to the [Data Import](#) Tab from the [Admin](#) button. Select "Simple Upload / Import from CSV" under "Resource Import".

Create a Job Name and Description for the import. This is especially useful to keep track of progress in cases the data arrives from multiple sources, or will require multiple stages of manual review.

Select the .csv file that you prepared above by selecting the "Choose File" button, and browsing to the correct file location. Then hit "Start Import".

Customer Import

Existing Jobs

Step 1: New Import
 The Customer Import accepts CSV files in a variety of configurations and formats. For an example file, [click here](#). Please make sure all data files are encoded with UTF-8 for best results.

Job Name: Description:

Choose File

File must be in CSV Format.

Working with Large or Multiple Data Sets

Although you cannot add new files to an existing job, for jobs with multiple sources for data (which may have different formatting), you can simply create separate jobs and descriptions for each source - no need to manually combine the data into one file before importing. The Import tool's mapping and editing functions will allow for the data to be reconciled in ProVision.

For large data sets where multiple stages of manual review might be needed, you can create a new job using the same set of data files in order to work in parallel on a different portion of the data.

After importing, the new job will appear under the "Existing Jobs" section. To continue working with this job, select it from the list (by clicking on the link) and the next step will appear on the page.

Customer Import

Existing Jobs
[Sample Customer Import last modified 15-04-2015 2:59 PM](#) 

Step 1: New Import
 The Customer Import accepts CSV files in a variety of configurations and formats. For an example file, [click here](#). Please make sure all data files are encoded with UTF-8 for best results.

Job Name: Description:

Choose File

File must be in CSV Format.

Step 2: Define Columns

Using the dropdown menu above each data field, select the appropriate definition for each of the imported columns. **Phone** and **Fax** may have multiple columns associated with the data. Other columns which do not apply under the available definitions should be left as blank, and will be skipped during the upload process.

Make sure that you have defined all desired fields by using the scroll bar below your data to view additional columns.

When completed, hit "Next".

Step 2: Define Columns

The import process requires you to enumerate the function of the columns in the provided CSV. The 'Customer Id' field is your internal customer identification system and can be referenced elsewhere.

Customer Id	Name	Phone	Mail Street 1
Unique ID	Name	Phone	Mail_street_1
6c-004	BitBandits, Inc.	408-555-2341	123 Flagle St.
6c-005	PJS Motorsports	408-555-2341	367 Maple Ave
6c-006	Samsung International	756-344-3241	672 Avenue of the Americ
6c-007	Sony Online		23429 Franklin Ave
6c-008	Acer Worldwide		765 Stevens Creek Blvd
6c-009	Publishers Clearinghouse Network		123 Brandywine ave
6c-010	Cisco Systems	987-234-2341	36 Tasman Drive

Next

Step 3: Reviewing Data

After supplying the file and defining columns, a review step is provided. Records with errors will show as color coded, and can be filtered to be viewed by All, Valid, Warnings, Invalid, or Ignored.

From here, the records can be edited or ignored. Select "Ignore" for records that you do not wish to import at this time. Records that are Ignored or Invalid will automatically be skipped.

Header Rows

If your .csv has a header row as the first line, that row will be shown as the first record in review data as well. Simply click "Ignore" on the first record to disregard the row.

Step 3: Review Data

Please review the data for correctness. Invalid and ignored rows will be skipped.

View: All Valid Warnings Invalid Ignored

Name		
	A customer already exists with this name!	<input type="button" value="Enable"/>
BitBandits,Inc.	A customer already exists with this name!	<input type="button" value="Edit"/> <input type="button" value="Ignore"/>
PJS Motorsports		<input type="button" value="Edit"/> <input type="button" value="Ignore"/>
Samsung International		<input type="button" value="Edit"/> <input type="button" value="Ignore"/>
Sony Online		<input type="button" value="Edit"/> <input type="button" value="Ignore"/>
Acer Worldwide	A customer already exists with this name!	<input type="button" value="Edit"/> <input type="button" value="Ignore"/>
Publishers Clearinghouse Network		<input type="button" value="Edit"/> <input type="button" value="Ignore"/>
Cisco Systems	A customer already exists with this name!	<input type="button" value="Edit"/> <input type="button" value="Ignore"/>
Juno Networks		<input type="button" value="Edit"/> <input type="button" value="Ignore"/>
APC/Schneider	A customer already exists with this name!	<input type="button" value="Edit"/> <input type="button" value="Ignore"/>
Sungard Inc.		<input type="button" value="Edit"/> <input type="button" value="Ignore"/>
Terremark Worldwide		<input type="button" value="Edit"/> <input type="button" value="Ignore"/>

Hitting the "Edit" button for the record provides options to change or add information for available fields.

After editing, hit "Save", and continue reviewing / editing data as desired.

Name:	Safeway	Custom Field:	Adding Custom Entry	<input type="button" value="View"/>	<input type="button" value="Save"/>
Customer Id:	6c-016	Fax:			
Phone:		Email 2:			
Email 1:		Mail Street 2:			
Mail Street 1:	674 Flaring Way	Mail State:	CA		
Mail City:	Los Angeles	Mail Country:	US		
Mail Zip:	759283	Billing Street 2:			
Billing Street 1:		Billing State:			
Billing City:		Billing Country:			
Billing Zip:		Org Id:			
Net POC:		Origin ASN:			
Org POC:					

Step 4: Execute Import

When the review step is completed, hit the "Execute Import" button. A progress bar will appear to show progress and note errors if they occur.

When the bar reaches 100%, the import is complete.

Step 4: Import Data

When you have reviewed the data import job for accuracy, hit the Execute Import button. All rows which are disabled, invalid, have warnings, or were previously successful will be passed over. Successful import rows will be marked as such.

[Execute Import](#)

Current Step: Finished!

Resource Import Tool

Importing Resources

- Importing Resources
 - The Resource Import Tool
 - Before You Begin
 - Opening the Resource Import Tool
 - The Resource Import Tool UI
 - Resource Importer Walkthrough

The Resource Import Tool

The Resource Import Tool (in beta) allows you to import resource data from a .csv file into ProVision. In the Resource Import Tool, you can open one or more user-created .csv spreadsheets, perform basic editing functions if needed, associate the data to a specific Section, and correlate the data columns to specific Section Fields.

In ProVision, since Resources can be any desired entity, and Sections can be anything from "customers" to "firewalls" to "racks", you have total flexibility in what type of data to import with the Resource Importer to meet your specific company needs. Check out [Working With Resources](#), [Customizing Sections](#), and [Customizing Fields](#) for more details on how to fit these elements to your business.

Before You Begin

There are a few items that you will need have set up prior to using the Resource Importer Tool. Ensure that you have:

- The .csv document you wish to import saved with UTF-8 encoding. Windows, Mac, and Linux type .csv files are supported.
- A header row for the data in the .csv.
- The .csv file should be "clean", that is, only contain the data to be imported and a header row for that data.
- A Section created in ProVision with fields that correlate to the import data. For example, if you wish to import a list of contact information, there will need to be a Section in ProVision created for "Contacts", with fields such as "First Name", "Last Name", "email address", "Phone number", and so on. To create a new Section, or edit an existing Section, refer to [Working With Resources](#), [Customizing Sections](#), and [Customizing Fields](#).

If the above preconditions are not met, the Resource Importer Tool may not be able to correctly read the .csv file or complete the import. Verify UTF-8 .csv encoding, a clean dataset with a header row, and that an appropriate Section exists in ProVision prior to import.

Best Practice

To ensure a fast and straightforward resource import, best practice is to verify ahead of time that your .csv data is correct and contains all the necessary column information for the Section. This includes a top-level Name and Unique ID, as well as a column per Section field. Data edits and column adjustments can be performed inside the Resource Importer Tool if necessary, but will require additional time and steps.

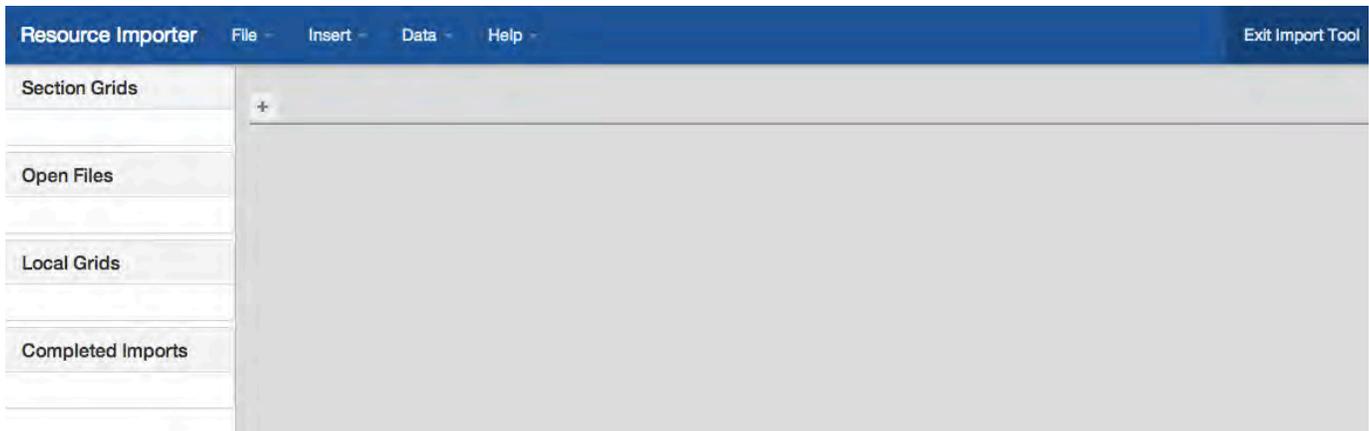

Opening the Resource Import Tool

To open the Resource Import Tool, navigate to the [Data Import Tab](#) from the [Admin button](#) to import your aggregate blocks. Select "Resource Import Tool" under "Resource Import".

The Resource Import Tool UI

When you first open the Resource Importer, you will be given the option to view a short on-screen guide to using the tool. After stepping through the guide and/or exiting out of it, the tool will look like this:

On the top are standard menu options of "File", "Insert", and "Data" and "Help". Under those menus, you may see greyed-out functions listed. Those functions are items under development, or not available to use at the current Importer step.

On the left side of the screen is a listing of currently opened files:

Sections Grids lists grids currently open that were created from a ProVision Section

Open Files lists the current user created .csv spreadsheets that are open

Local Grids lists any grids that were created in the tool itself, instead of opened from an external file

Completed Imports show imports which have been completed and imported into ProVision

If, at any time, you need to leave the Resource Importer Tool, select the "Exit Import Tool" in the top right corner of the screen, and you will be taken back to the ProVision Dashboard.

Exiting the Resource Importer Tool prior to completing the import process will result in the current open grids being discarded.

Resource Importer Walkthrough

For a step by step walkthrough of the Resource importer, continue on to the Resource Importer Walkthrough , which shows how to import a sample contact list and perform minor editing tasks.

[Resource Importer Walkthrough - Step 1 Upload your .csv data file](#)

[Resource Importer Walkthrough - Step 2 Open a Template Grid from an existing Section](#)

Resource Importer Walkthrough - Step 3 Reorder .csv columns to match the Section Grid column order

Resource Importer Walkthrough - Step 4 Edit Data as Needed

Resource Importer Walkthrough - Step 5 Drag rows from the .csv Grid to the Section Grid

Resource Importer Walkthrough - Step 6 Import into ProVision

Resource Importer Walkthrough - Step 1

Importing Resources

Before You Begin

Ensure that you are familiar with the overview and "Before you Begin" requirements listed on the [Resource Import Tool](#) page.

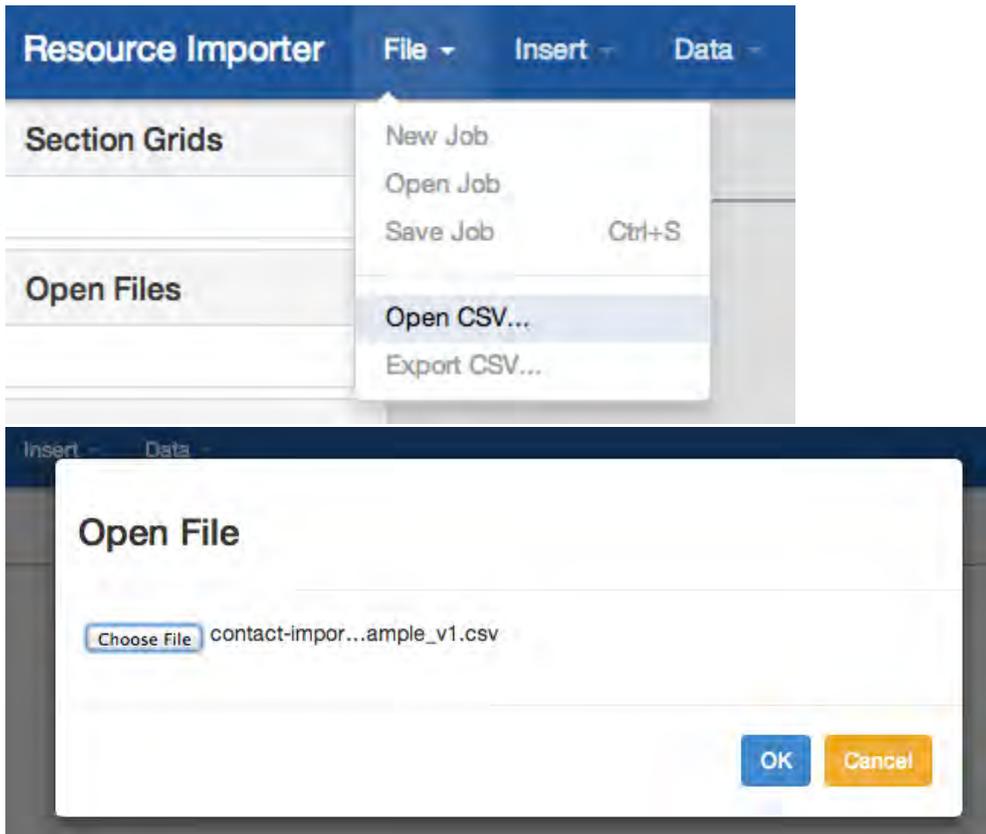

For this tutorial, we will be using the Contact Import Sample .csv available on the [Import Templates](#) page as an example, and associating it to an existing Section called "Contact" having the fields: First Name, Last Name, Email, 2nd Email, Phone, 2nd Phone, Mobile Phone, Role, and Time Zone. To create this Section, or edit an existing Section, refer to [Working With Resources](#), [Customizing Sections](#), and [Customizing Fields](#).

In order to illustrate the abilities of the Resource Importer to edit data and adjust for formatting issues, the Contact Import Sample .csv is used intentionally leaving a few less-than-ideal conditions (much like you may encounter in real life) such as leaving typos, having an extra data column, and missing a needed column. If you follow the "Before you Begin" requirements and "Best Practice" notes, however, you may be able to skip any editing or column adjustment steps.

When you are ready to begin, open the Resource Importer and proceed to Step 1.

Step 1: Upload your .csv data file

Under the "File" Menu, select "Open .csv". Browse to and select your UTF-8 encoded data file.

After hitting "OK", your file should be visible in the workspace, as well as listed under "Open Files" like this:

Resource Importer File Insert Data Help Exit Import Tool

Section Grids

Open Files

10	<input type="checkbox"/>	6c-014	Sarah	Campbell	Account Executive	sa.camp@intel.net		234-234 1234	888-cal
11	<input type="checkbox"/>	6c-015	Amanda	Kingston	Sales	akingston@sellin...		44 123 555 12	866-55

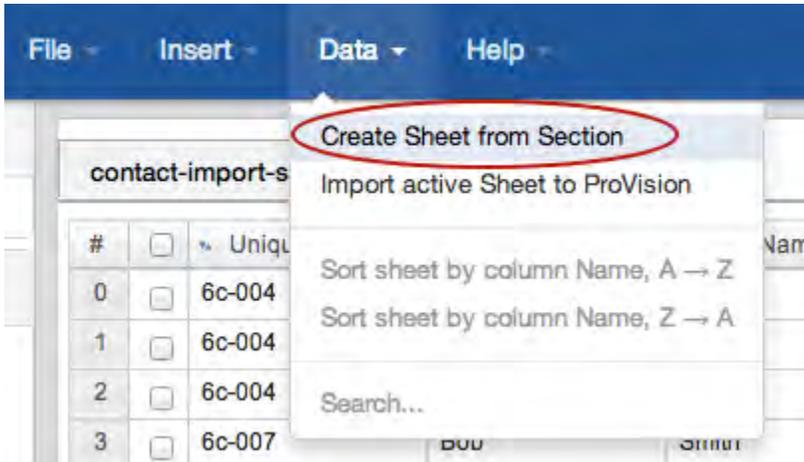

After opening your .csv grid, proceed to Step 2 - Open a template grid from an existing Section

Resource Importer Walkthrough - Step 2

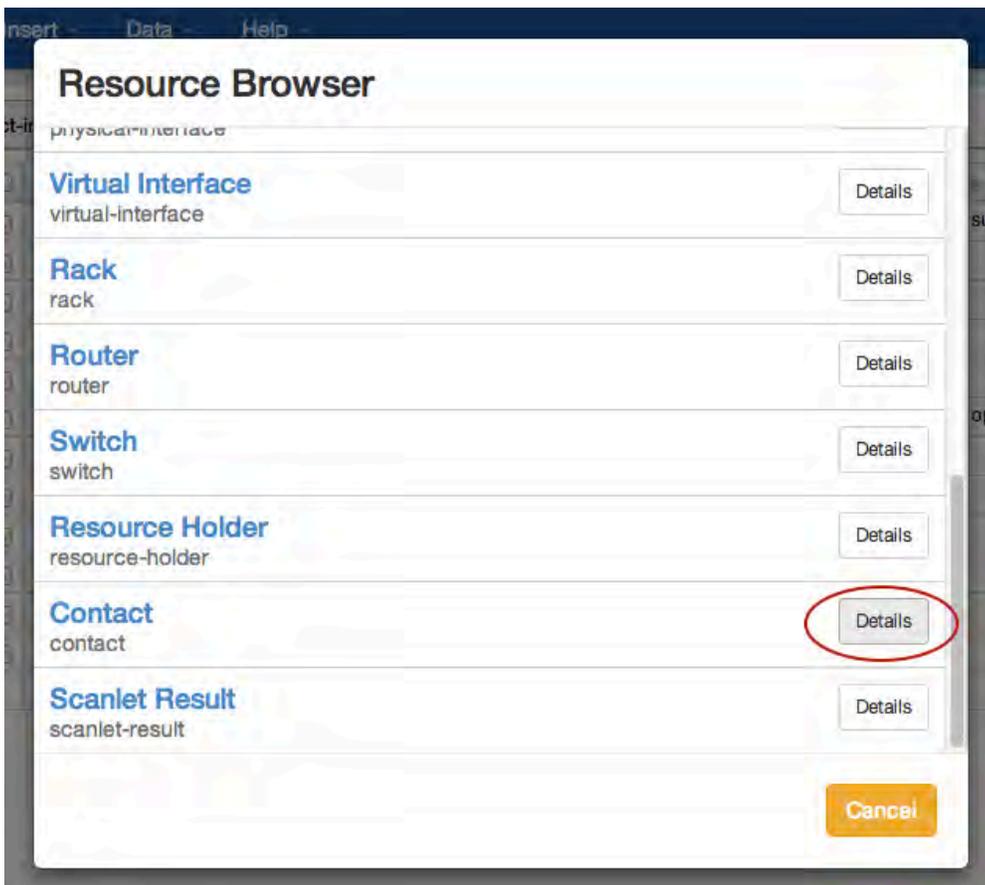

Importing Resources

Step 2: Open a Template Grid from an existing Section

Under the "Data" menu, select "Create Sheet from Section".

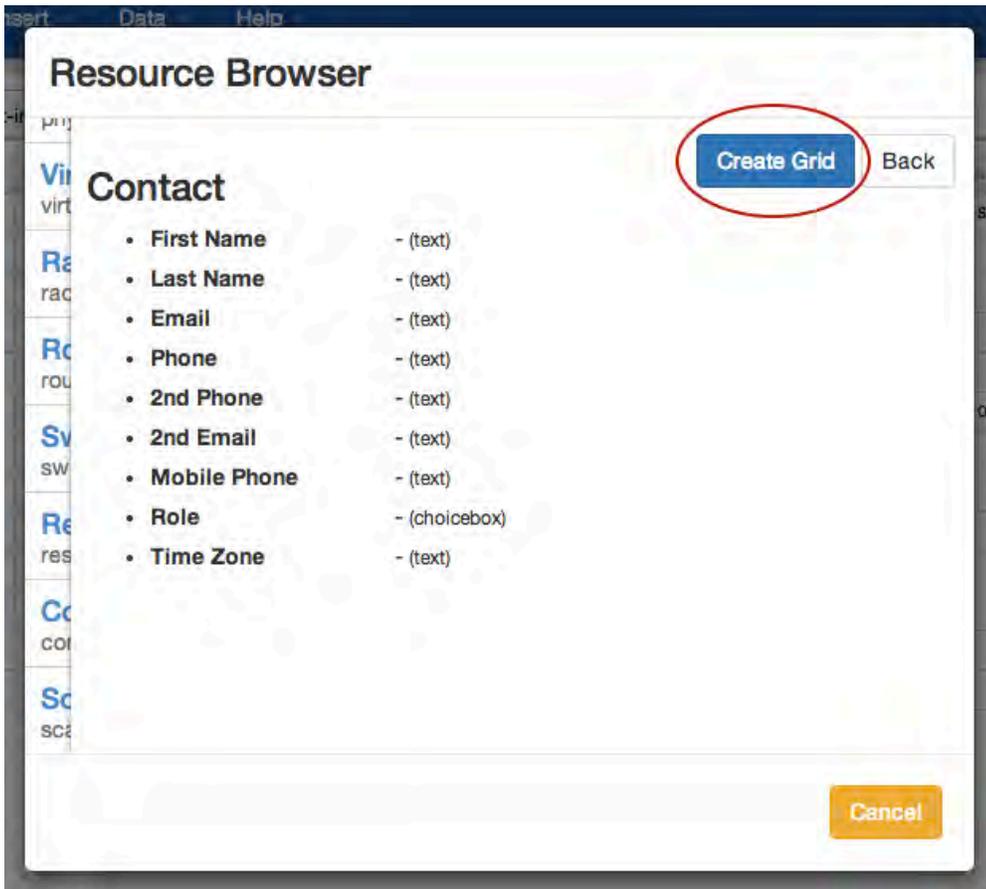

The Resource Browser will pop up, showing the list of Sections currently available in Provision. Clicking on the "Details" button will show the fields for that Section.

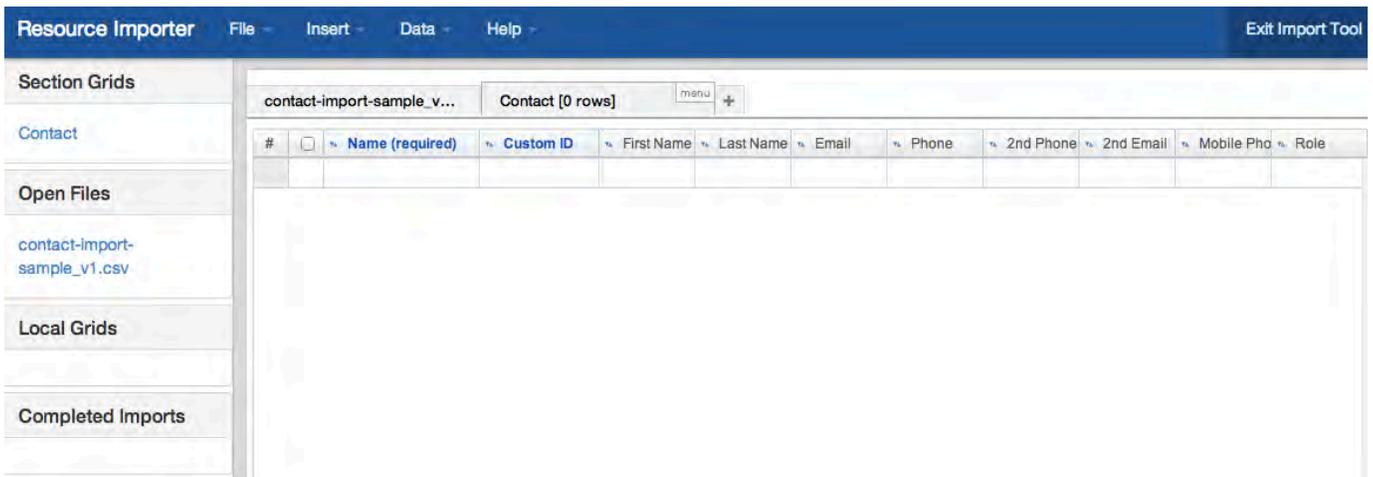

Verify that the Section and available fields match the type of data you are trying to import. In this case, the Section "Contact" has the fields that correlate to our spreadsheet data.

Select "Create Grid" to create a grid based off this Section.

When the Section Grid has been created, required fields will show in blue font with (required) after the header, in this case, "Name" is a required field. The "Custom ID" field is metadata allowing for a unique ID to be associated with each entry, but is not necessary for a successful import. The remainder of the headers directly match the Section's fields.

After you have opened your Section Grid, proceed to Step 3: Reorder .csv columns to match the Section Grid

Resource Importer Walkthrough - Step 3

Importing Resources

Step 3: Reorder .csv columns to match the Section Grid column order

One of the most important steps is to reorder the columns from the .csv data to match the order of the Section Grid headers - think of the importer as copying and pasting the csv data into the "Contact" Section grid- we want to ensure that the data is under the correct headers!

Click on the column header to Drag and Drop to the desired location:

#	<input type="checkbox"/>	Unique ID	Last Name	First Name
0	<input type="checkbox"/>	6c-004	Hughes	Aaron
1	<input type="checkbox"/>	6c-004	Parker	John
2	<input type="checkbox"/>	6c-004	Taylor	Tom
3	<input type="checkbox"/>	6c-007	Smith	Bob

Click back and forth between the tabs to verify the column order, then click on a header and drag and drop into the desired order. This moves not only the header, but also the data below it.

Common Column Editing Questions

What if just my column headers are in the wrong place?

What if I have too many / too few columns in my .csv to match the Section Grid?

If you see any of these issues, proceed to [Step 4 - Edit data as needed](#).

Otherwise, if your columns match up perfectly and none of the data needs editing, skip to [Step 5 - Drag rows to the Section Grid](#)

Resource Importer Walkthrough - Step 4

Importing Resources

Step 4: Edit data as needed

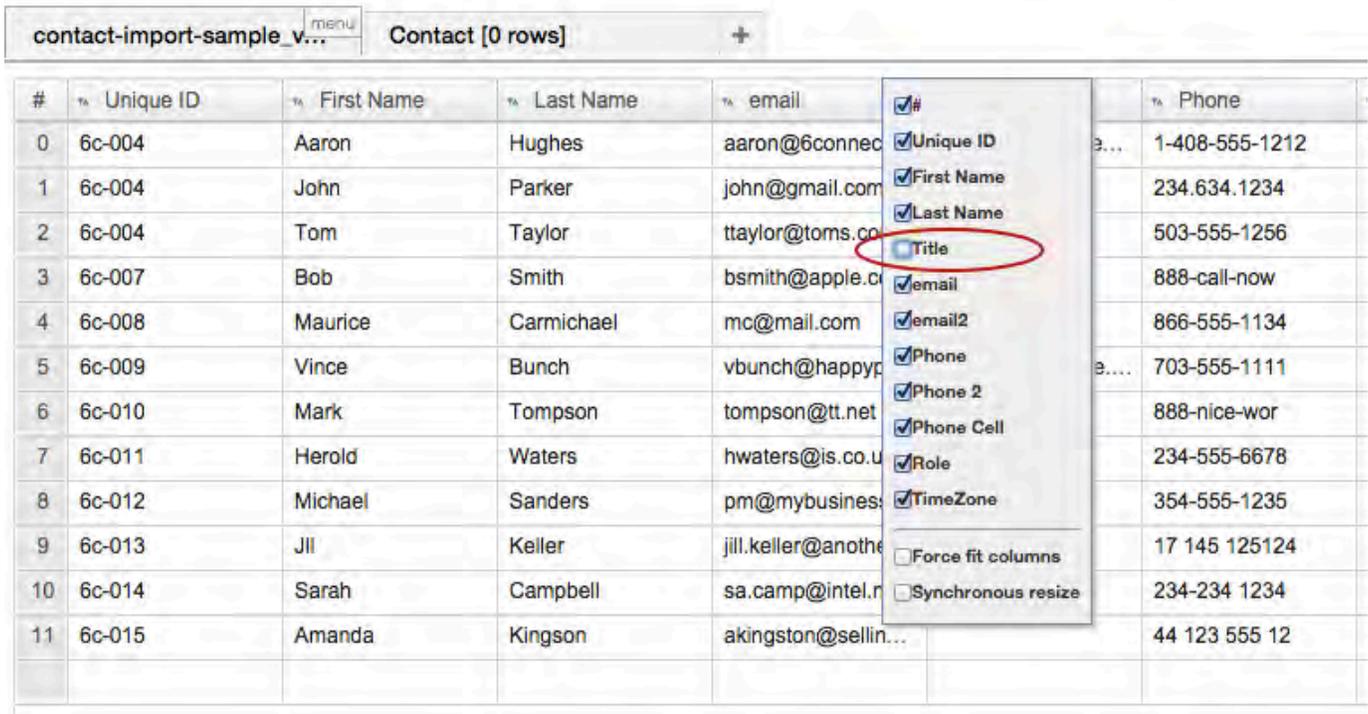

As you may have noticed in Step 3, with this example we have a couple of columns that don't quite match up to the Section Grid. The "Title" column in the .csv data is an additional column we are not tracking in our Section. Also, although we have a "First Name" and "Last Name", we are missing a data column for the top-level "Name" required in the Section Grid.

Common Editing Questions:

- What if I have too many / too few columns in my .csv to match the Section Grid?
- What if I see a typo in the .csv data?
- What if just my column headers are in the wrong place?

To hide extraneous column information:

Right click on a header and deselect the check box for the column you wish to hide. In this case, we want to hide "Title".

#	Unique ID	First Name	Last Name	email	Title	Phone
0	6c-004	Aaron	Hughes	aaron@6connec		1-408-555-1212
1	6c-004	John	Parker	john@gmail.com		234.634.1234
2	6c-004	Tom	Taylor	ttaylor@toms.co		503-555-1256
3	6c-007	Bob	Smith	bsmith@apple.c		888-call-now
4	6c-008	Maurice	Carmichael	mc@mail.com		866-555-1134
5	6c-009	Vince	Bunch	vbunch@happyp		703-555-1111
6	6c-010	Mark	Tompson	tompson@tt.net		888-nice-wor
7	6c-011	Herold	Waters	hwaters@is.co.u		234-555-6678
8	6c-012	Michael	Sanders	pm@mybusines		354-555-1235
9	6c-013	Jill	Keller	jill.keller@anoth		17 145 125124
10	6c-014	Sarah	Campbell	sa.camp@intel.n		234-234 1234
11	6c-015	Amanda	Kingston	akingston@sellin...		44 123 555 12

To Edit Data in the Resource Importer

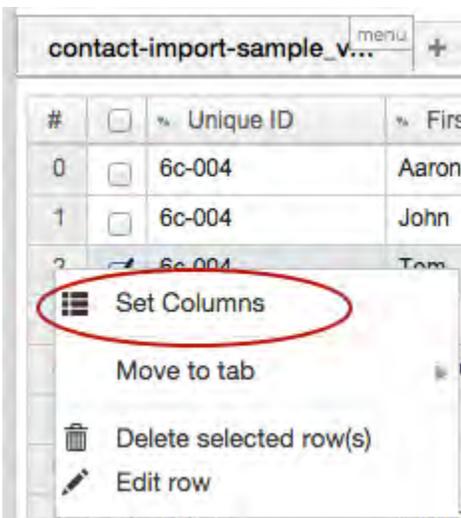

Data in the grids can be edited directly by clicking on the cell(s). In our example, we can see that "Amanda Kingston" should really be "Amanda Kingston". Let's fix that! Click in the cell, type in the edit you wish to make, and then click outside of the cell to exit edit mode. To edit a full row of data, you can right click on the row, select "Edit" row, and make multiple changes in the form box.

#	<input type="checkbox"/>	% Unique ID	% First Name	% Last Name	% email	% email2	% Phone
0	<input type="checkbox"/>	6c-004	Aaron	Hughes	aaron@6connect...	support@6conne...	1-408-555-1212
1	<input type="checkbox"/>	6c-004	John	Parker	john@gmail.com		234.634.1234
2	<input type="checkbox"/>	6c-004	Tom	Taylor	ttaylor@toms.com		503-555-1256

7	<input type="checkbox"/>	6c-011	Herold	Waters	hwaters@is.co.uk		234-555-6678
8	<input type="checkbox"/>	6c-012	Michael	Sanders	pm@mybusiness...		354-555-1235
9	<input type="checkbox"/>	6c-013	Jill	Keller	jill.keller@another...		17 145 125124
10	<input type="checkbox"/>	6c-014	Sarah	Campbell	sa.camp@intel.net		234-234 1234
11	<input checked="" type="checkbox"/>	6c-015	Amanda	Kingston	akingston@sellin...		44 123 555 12

If a column header is over the wrong data:

If just the header is in the wrong spot (doesn't match the data below it), you can move just the column header in the Resource Importer, without moving the data below it.

1) Right click on a row of the grid to edit and select "Set Columns":

2) In the "Change Column Header" dialog box, drag and drop the column header(s) into the desired order. Remember, this only moves the headers, not the data below them! Then, hit "OK".

Change Column Header

The dialog box contains a list of column headers. The first header is "#". The second header is "<input type='checkbox'>". The remaining headers are: Unique ID, First Name, Last Name, Title, email, email2, Phone, Phone Cell, Phone 2, TimeZone, and Role. At the bottom of the dialog are two buttons: "OK" (blue) and "Cancel" (orange).

If your .csv data is missing a data column needed for the Section grid:

In our case, the .csv data is missing the required "Name" column for the Section grid. Think of the "Name" as the information you would want to search for in Provision. We wouldn't want to search just for "Bob" or "Smith" when looking down a list of names, so under the "Name" column, we need to see the full first and last names, like "Bob Smith".

Currently, our options to fix this are:

1) Edit the .csv directly in your spreadsheet program: (Recommended) Simply revise the .csv to include another column for "Name", and re-open the .csv in the importer. The benefit to this method is your .csv file will be set up as a template for future imports.

Or:

2) In the Resource Importer, temporarily hide the extra column in the Section Grid: Make the columns between the .csv and the Section Grid match exactly by temporarily [hiding the column](#) (in this case, "Name") in the Section Grid, proceed to move the data into the Section grid (see Step 5), then unhide the "Name" column and manually add the data as needed prior to completing the import.

contact-import-sample_v...		Contact [12 rows]		menu		+

When edits and adjustments are complete, move to Step 5 - Drag rows to the Section Grid

Resource Importer Walkthrough - Step 5

Importing Resources

Step 5: Drag rows from the .csv Grid to the Section Grid

Once you have set the columns to match exactly between the .csv Grid and the Section grid, it's time to pull in the data from one to the other.

Simply click the checkboxes for the rows you wish to import (or use the "Select all" checkbox at the top), click anywhere on the row, and drag & drop onto the Section Grid tab ("Contact"). The tool will tell you how many rows you are moving as you drag them.

The screenshot shows the Resource Importer interface. On the left, the 'Section Grids' panel has the 'Contact' tab selected. The main area displays a table with 12 rows of data, each with a checked checkbox in the first column. A red circle highlights the 'Contact [0 rows]' tab, and a red arrow points to it from the 'Contact' tab in the left panel. A red box around the table header indicates 'Dragging 12 row(s)'. The table columns are: #, Unique ID, First Name, Last Name, email, email2, Phone, Phone 2, and Phone Cell.

#	Unique ID	First Name	Last Name	email	email2	Phone	Phone 2	Phone Cell
0	6c-004	Aaron	Hughes	aaron@6connect...	support@6conne...	1-408-555-1212	1-408-555-1212	1-408-555-1212
1	6c-004	John	Parker	john@gmail.com		234.634.1234		888-call-now
2	6c-004	Tom	Taylor	ttaylor@toms.com		503-555-1256		866-555-1134
3	6c-007	Bob	Smith	bsmith@apple.com		888-call-now		703-555-1111
4	6c-008	Maurice	Carmichael	mc@mail.com		866-555-1134		888-nice-wor
5	6c-009	Vince	Bunch	vbunch@happypla...	ops@happyplace...	703-555-1111		234-555-6678
6	6c-010	Mark	Tompson	tompson@tt.net		888-nice-wor		354-555-1235
7	6c-011	Herold	Waters	hwaters@is.co.uk		234-555-6678		17 145 125124
8	6c-012	Michael	Sanders	pm@mybusiness...		354-555-1235		234-234 1234
9	6c-013	Jill	Keller	jill.keller@another...		17 145 125124		44 123 555 12
10	6c-014	Sarah	Campbell	sa.camp@intel.net		234-234 1234		888-call-now
11	6c-015	Amanda	Kingston	akingston@sellin...		44 123 555 12		866-555-1134

Click on the "Contact" tab when you are done, and you will now see your data in there, instead of the original .csv.

If you had to hide columns in the Section Grid prior to moving the .csv data, verify that all columns are visible and the required data filled in. In this case, we filled in the "Name" Column that was missing in the original .csv.

The screenshot shows the Resource Importer interface with the 'Contact' section grid. The 'Contact' tab is selected in the left panel. The main area displays a table with 12 rows of data, each with an unchecked checkbox in the first column. The table columns are: #, Name (required), Custom ID, First Name, Last Name, Email, 2nd Email, Phone, 2nd Phone, Mobile Phone, Role, and Time Zone. The row for Amanda Kingston is highlighted with a blue border.

#	Name (required)	Custom ID	First Name	Last Name	Email	2nd Email	Phone	2nd Phone	Mobile Phone	Role	Time Zone
0	Aaron Hughes	6c-004	Aaron	Hughes	aaron@6c...	support@...	1-408-555...	1-408-555...	1-408-555...	Technical	PT

11	Amanda Kingston	6c-015	Amanda	Kingston	akingston...		44 123 55...		866-555-1...	Technical	PT

After moving your data into the Section grid, proceed to Step 6 - Importing into ProVision.

Resource Importer Walkthrough - Step 6

Importing Resources

Step 6: Import into ProVision

When all of the data is under the Section Grid tab, and any required field data filled in, you can import the data into Provision! From the Data menu, select "Import active Sheet into ProVision". You will see an import progress bar. Once complete, you data will be in provision, filled into the Section fields for your chosen Resource.

The screenshot shows the 'Resource Importer' application interface. The 'Data' menu is open, and the option 'Import active Sheet to ProVision' is circled in red. The main window displays a grid of contact data with columns for Last Name, Email, 2nd Email, Phone, 2nd Phone, Mobile Phone, Role, and Time Zone. The data is as follows:

#	<input type="checkbox"/>	Name	6c-007	Bob	Last Name	Email	2nd Email	Phone	2nd Phone	Mobile Phc	Role	Time Zone
0	<input type="checkbox"/>	Aaron H			Hughes	aaron@6c...	support@...	1-408-555...	1-408-555...	1-408-555...	Technical	PT
1	<input type="checkbox"/>	John Pe			Parker	john@gm...		234.634.1...		888-call-now	Technical	ET
2	<input type="checkbox"/>	Tom Ta			Taylor	ttaylor@to...		503-555-1...		866-555-1...	Technical	ET
3	<input type="checkbox"/>	Bob Smi...	6c-007	Bob	Smith	bsmith@a...		888-call-now		703-555-1...	Technical	ET
4	<input type="checkbox"/>	Maurice Carmichael	6c-008	Maurice	Carmichael	mc@mail...		866-555-1...		888-nice-...	Abuse	GMT
5	<input type="checkbox"/>	Vince Bunch	6c-009	Vince	Bunch	vbunch@...	ops@hap...	703-555-1...		234-555-6...	Sales	CT
6	<input type="checkbox"/>	Mark Tompson	6c-010	Mark	Tompson	tompson...		888-nice-...		354-555-1...	Billing	PT
7	<input type="checkbox"/>	Herold Waters	6c-011	Herold	Waters	hwaters@l...		234-555-6...		17 145 12...	Billing	PT
8	<input type="checkbox"/>	Michael Sanders	6c-012	Michael	Sanders	pm@myb...		354-555-1...		234-234 1...	Sales	PT
9	<input type="checkbox"/>	Jll Keller	6c-013	Jll	Keller	jill.keller@...		17 145 12...		44 123 55...	Technical	PT
10	<input type="checkbox"/>	Sarah Campbell	6c-014	Sarah	Campbell	sa.camp...		234-234 1...		888-call-now	Technical	PT
11	<input type="checkbox"/>	Amanda Kingston	6c-015	Amanda	Kingston	akingston...		44 123 55...		866-555-1...	Technical	PT

The screenshot shows a dialog box titled 'Importing' with a progress bar. The progress bar is blue and shows 11 out of 12 items imported, indicated by the text '11 / 12' in the center of the bar.

Import Sessions

Importing Sessions

- Importing Sessions
 - Peering Import
 - Select Groups and Sessions

Peering Import

Importing peering sessions requires Admin-level permissions, and is accessible only from the Admin section of ProVision.

From the Admin section of ProVision, navigate to the **Data Import Tab**. Under Peering Import, select **Import BGP Sessions**. This will take you to the Peering Import section of ProVision.

First, select the desired exchange and router. Routers with Logical Systems information will show up as the router name with the Logical System info in parenthesis (e.g. "Juniper (test)"). Then click "Load Sessions".

Peer Group and Sessions will then display below your selections.

Select Groups and Sessions

The available peer Groups and Sessions will display below your selected exchange and router. If edits need to be made to the session prior to import, simply click on the wrench icon to edit fields, then click "Done".

Lastly, select the check box next to each Session to import (or the check box at the top to select all sessions) and click "Import Selected Sessions". Successful imports will then display with a green check mark at the beginning of the row.

Peering Import

Exchange Equinix Internet Exchange Palo **Router** Juniper Lab1 Test (test2) **Load Sessions**

Importing sessions from Juniper Lab1 Test (test2) (50.240.195.137) at Equinix Palo Alto. Clear

2 sessions found. 0 already imported or added.

Peer Groups

Name	Type
<input checked="" type="checkbox"/> equinix-test2	ipv4

Import Selected Groups

Sessions

<input checked="" type="checkbox"/>	Type	Source ASN	Peer	Peer ASN	Peer IP	Group	Logical System	State
<input checked="" type="checkbox"/>	Peer	221133	Limelight Networks	22822	198.32.176.9	equinix-test2	test2	Idle
<input checked="" type="checkbox"/>	Peer	221133	Internap (formerly Voxel)	29791	198.32.176.59	equinix-test2	test2	Idle

Import Selected Sessions Clear

The next step is to configure and manage your sessions.

IP Import from CSV

Simple Upload / Import from CSV

The [Upload / Import from CSV](#) tool is used if you have a simple .csv file with IP block information, such as CIDR, Mask, ASN, RIR, etc. It is accessed from the [Data Import Tab](#) from the [Admin](#) section of ProVision.

To import your IP block information, follow the following steps:

- Simple Upload / Import from CSV
 - Before you Begin: Prepare your Data for Import
 - Step 1: Create a new Resource / Customer Import Job
 - Step 2: Define Columns
 - Step 2.5: Missing References
 - Step 3: Reviewing Data
 - Step 4: Execute Import

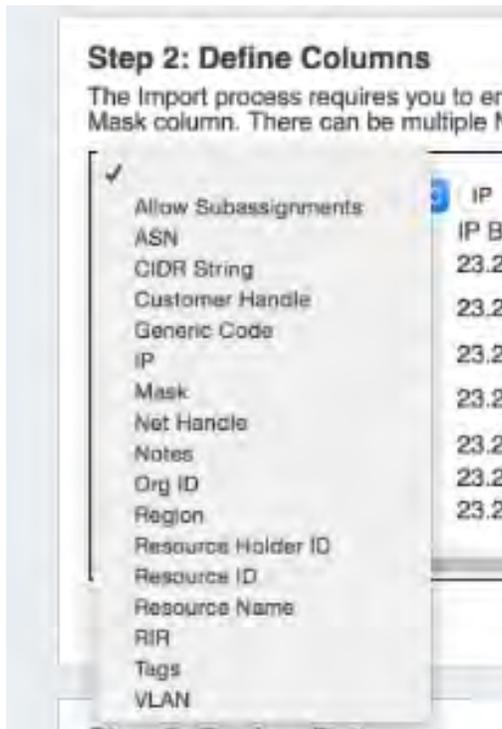

Before you Begin: Prepare your Data for Import

The [Upload / Import from CSV](#) tool requires only a .csv file for importing.

Be sure to review "Preparing Data for Import" on the [Importing your Data](#) page before you begin. Verify that your .csv is correctly parsed and cleanly formatted with your IP block information (using your choice of the available field list shown below), and is UTF-8 encoded for best results.

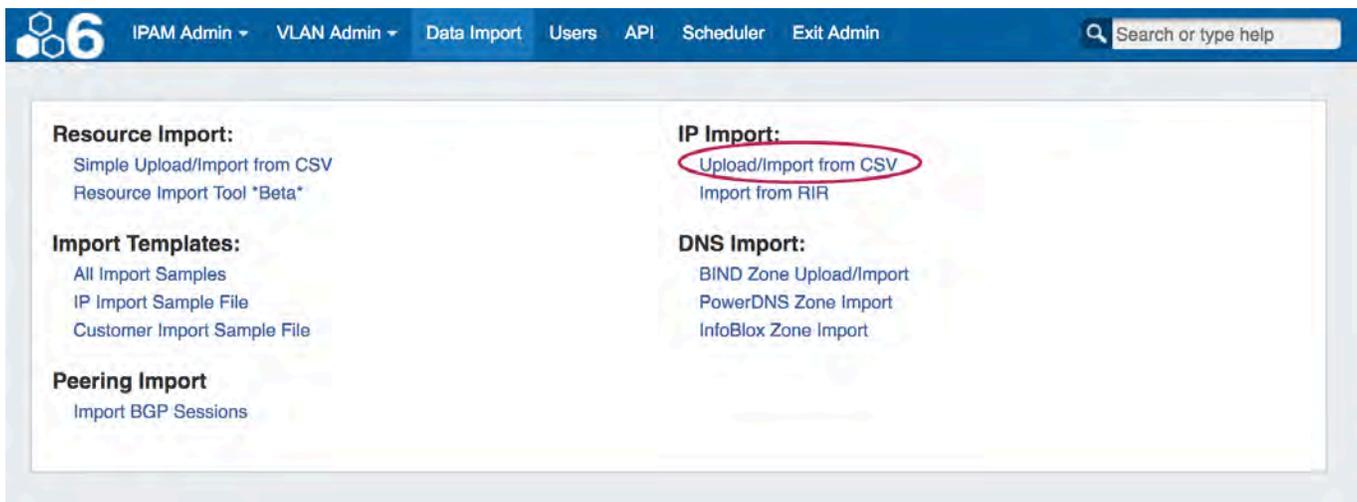

This tool supports the following fields:

✓ [Click here to expand...](#)

Step 1: Create a new Resource / Customer Import Job

Navigate to the [Data Import](#) Tab from the [Admin](#) button. Select "Upload / Import from CSV" under "IP Import".

Create a Job Name and Description for the import. This is especially useful to keep track of progress in cases the data arrives from multiple sources, or will require multiple stages of manual review.

Select the .csv file that you prepared above by selecting the "Choose File" button, and browsing to the correct file location. Then hit "Start Import".

IP Import

Step 1: New Import
 The IP Import accepts CSV files in a variety of configurations and formats. For an example file, [click here](#). Please make sure all data files are encoded with UTF-8 for best results.

Job Name: Description:

Choose File

File must be in CSV Format.

Working with Large or Multiple Data Sets
 Although you cannot add new files to an existing job, for jobs with multiple sources for data (which may have different formatting), you can simply create separate jobs and descriptions for each source - no need to manually combine the data into one file before importing. The Import tool's mapping and editing functions will allow for the data to be reconciled in ProVision.

For large data sets where multiple stages of manual review might be needed, you can create a new job using the same set of data files in order to work in parallel on a different portion of the data.

After importing, the new job will appear under the "Existing Jobs" section. To continue working with this job, select it from the list (by clicking on the link) and the next step will appear on the page.

IP Import

Existing Jobs
[Example IP Import last modified 15-04-2015 4:39 PM](#) 

Step 1: New Import
 The IP Import accepts CSV files in a variety of configurations and formats. For an example file, [click here](#). Please make sure all data files are encoded with UTF-8 for best results.

Job Name: Description:

Choose File

File must be in CSV Format.

Step 2: Define Columns

Using the dropdown menu above each data field, select the appropriate definition for each of the imported columns. **CIDR** or **IP/Mask** fields must be provided. **Notes**, **Tags**, and **Regions** may have multiple columns associated with the data. If you do not have a defined **RIR** column, you must select a default RIR to associated the blocks to. Other columns which do not apply under the available definitions should be left as blank, and will be skipped during the upload process.

Make sure that you have defined all desired fields by using the scroll bar below your data to view additional columns.

When completed, hit "Next".

Step 2: Define Columns

The import process requires you to enumerate the function of the columns in the provided CSV. There must be either a CIDR column or both an IP and a Mask column. There can be multiple Notes, Tags, and Regions fields. Either a defined RIR column or a Default RIR is required.

Resource Holder ID	IP	Mask	RIR
ID	IP Block	subnet	RIR
543	10.2.3.0	/24	1918
544	10.5.3.2	/32	ARIN

Allow Subassignments
 ASN
 CIDR String
 Customer Handle
 Generic Code
 IP
 Mask
 Net Handle
 Notes
 Org ID
 Region
 Resource Holder ID
 Resource ID
 Resource Name
 RIR
 Tags
 VLAN

Default RIR:

Step 2.5: Missing References

If references exist in your data that do not currently exist in ProVision (such as new tags or resources) the import tool will alert you to the missing references, and give you the option to create those references in ProVision. If you wish to add these elements, select the checkboxes next to the element and click the "Add (Element name)" button below.

Step 2.5: Missing References

The importer has detected references which do not currently exist in the system. Rows referencing non-existent data cannot be imported. Please select the valid entries from the sections below and they will be added to the system before the formal import begins.

Tags

Tags	<input type="checkbox"/>
------	--------------------------

In this example, we get a notification that we are missing a tag named "Tags". However, we know by looking at our data that is simply an item that was part of the header line in the .csv, so we want to bypass this step.

Header Rows

If your .csv has a header row as the first line, that row may give information that produces a missing reference notice. If this is the case, simply uncheck that item and add only the desired references.

Step 3: Reviewing Data

After supplying the file and defining columns, a review step is provided. Records with errors will show as color coded, and can be filtered to be viewed by All, Valid, Warnings, Invalid, or Ignored.

From here, the records can be edited or ignored. Select "Ignore" for records that you do not wish to import at this time. Records that are Ignored or Invalid will automatically be skipped.

Header Rows

If your .csv has a header row as the first line, that row will be shown as the first record in review data as well. Simply click "Ignore" on the first record to disregard the row.

Step 3: Review Data
Please review the data for correctness. Invalid and ignored rows will be skipped.

View:

IP Block/subnet :: RIR	Invalid CIDR String. RIR does not appear in internal RIR list. Tag 'Tags' does not appear in internal Tags list.	<input type="button" value="Enable"/>
10.2.3.0/24 :: 1918		<input type="button" value="Edit"/> <input type="button" value="Ignore"/>
10.5.3.2/32 :: ARIN		<input type="button" value="Edit"/> <input type="button" value="Ignore"/>

Hitting the "Edit" button for the record provides options to change or add information for available fields.

After editing, hit "Save", and continue reviewing / editing data as desired.

Resource:	<input type="text" value="Test1"/>	<input type="button" value="View"/> <input type="button" value="Save"/>
CIDR:	<input type="text" value="10.2.3.0/24"/>	RIR: <input type="text" value="1918"/>
Region:	<input type="text" value="Boston, MA"/>	Org ID: <input type="text"/>
Tags:	<input type="text" value="Customer,Cable"/>	Notes: <input type="text" value="Internal space"/>
VLAN:	<input type="text"/>	Subassignments: <input type="checkbox"/>
ASN:	<input type="text"/>	Customer Handle: <input type="text"/>
Generic Code:	<input type="text" value="Generic Code Data"/>	Net Handle: <input type="text"/>

Step 4: Execute Import

When the review step is completed, hit the "Execute Import" button. A progress bar will appear to show progress and note errors if they occur.

When the bar reaches 100%, the import is complete.

Step 4: Import Data
When you have reviewed the data import job for accuracy, hit the Execute Import button. All rows which are disabled, invalid, have warnings, or were previously successful will be passed over. Successful import rows will be marked as such.

Current Block: Finished!

Import Aggregate Blocks

Import Aggregates

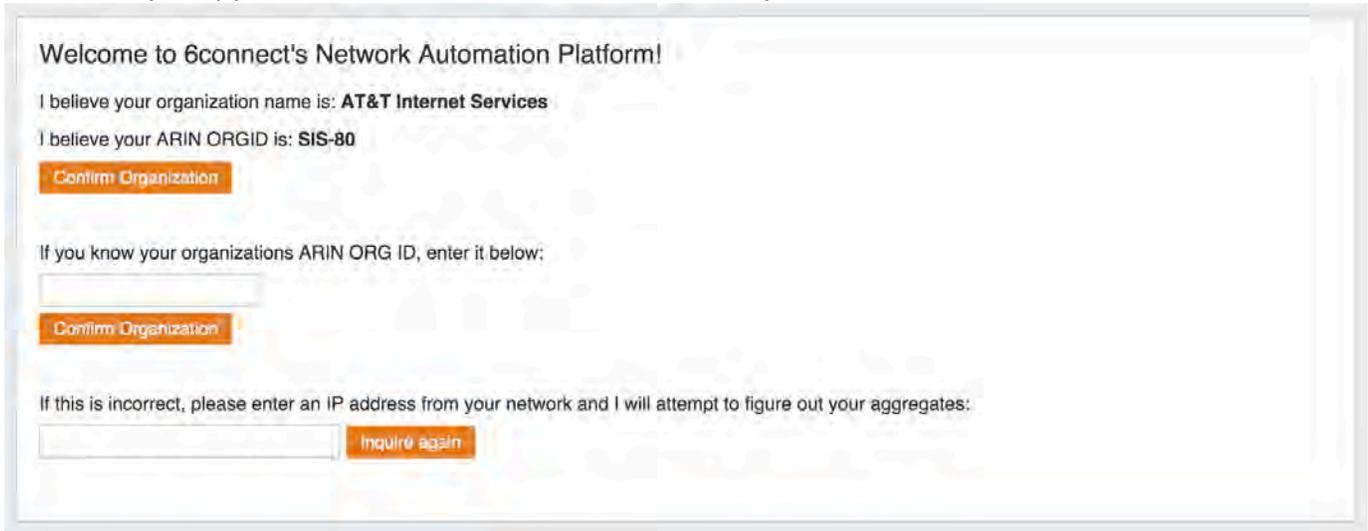

Navigate to the **Data Import Tab** from the **Admin button** to import your aggregate blocks. Select "Import from RIR" under "IP Import".

- Import Aggregates
 - Step 1: Lookup from Source IP
 - Step 2: Import your aggregate blocks
 - Step 3: Customizing

Step 1: Lookup from Source IP

We automatically lookup your ARIN or RIPE information based on the IP address you are connected to:

If you have another source IP that you would like to use for the lookup function, you can edit the IP and click on the "Inquire Again" button. If the organization name and ORGID are correct, then click on the "Confirm" button to go to the next screen.

Step 2: Import your aggregate blocks

Once we have identified the blocks assigned to your company, you can import the aggregates by pressing the "Add Aggregate" buttons. This page allows you to add both 1918 aggregates as well as public IP space from ARIN and RIPE.

Welcome to 6connect's Network Automation Platform!

This is IPv6 & IPv4 non-1918 space I have discovered

Found IPv4 block: 104.48.0.0/12	ARIN	104.48.0.0/12	✓
Found IPv4 block: 208.188.0.0/14	ARIN	208.188.0.0/14	✓
Found IPv4 block: 207.193.0.0/16	ARIN	Add Aggregate	
Found IPv4 block: 209.184.0.0/16	ARIN	Add Aggregate	
Found IPv4 block: 216.60.0.0/14	ARIN	Add Aggregate	
Found IPv4 block: 63.170.248.0/25	ARIN	Add Aggregate	
Found IPv4 block: 64.216.0.0/14	ARIN	Add Aggregate	

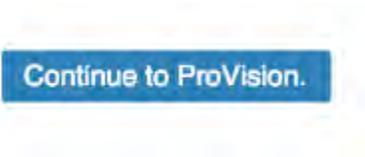

If you will be using RFC1918 space, you will likely want to add from this list:

RFC1918 block: 10.0.0.0/8	1918	10.0.0.0/8	✓
RFC1918 block: 192.168.0.0/16	1918	192.168.0.0/16	✓
RFC1918 block: 172.16.0.0/12	1918	172.16.0.0/12	✓

If you will be using Shared Transition Space, add:

RFC6598 block: 100.64.0.0/10	6598	Add Aggregate
------------------------------	------	-------------------------------

When done adding aggregates, hit the "Continue to ProVision" button at the bottom of the page. You will be redirected to the [IPAM](#) tab to manage the aggregates as desired.

Step 3: Customizing

With your aggregates added, you are now ready to customize the tool and import additional data! From here, you can manage your aggregates under the [IPAM](#) tab, edit administration functions under [IPAM Admin](#), or import resources using the [Resource Import Tool](#).

Import DNS Zones

Importing DNS Zones

ProVision offers three DNS zone import options, available under the [Data Import](#) tab in the the Admin section of ProVision:

BIND Zone Import

- Imports using the named.conf configuration file tied to the zones you are uploading, a .zip or .tar file of the zones themselves, and an optional .csv file mapping zones to customers.

PowerDNS Zone Import

- Option is available after configuring a PowerDNS server with a MySQL backend. Connects to the selected server and imports all zones.

InfoBlox Zone Import

- Imports DNS zones using a provided Host, Username, and Password. The InfoBlox import pulls all zones on the InfoBlox LOCAL grid and adds them to a designated Group. It is advised to [create a DNS Group](#) prior to the import with default parameters and NS records to be inherited by the imported records.

NS One Zone Import

- Imports DNS zones using a NS One API Key. It is advised to [create a DNS Group](#) prior to the import with default parameters and NS records to be inherited by the imported records.

Dyn DNS Zone Import

- Imports DNS zones using a Dyn DNS Customer Name, Username, and Password. It is advised to [create a DNS Group](#) prior to the import with default parameters and NS records to be inherited by the imported records.

DNSMadeEasy Zone Import

- Imports DNS zones using a DNSMadeEasy API Key and API Secret. It is advised to [create a DNS Group](#) prior to the import with default parameters and NS records to be inherited by the imported records.

Continue to the following sections for details on performing each import method:

- [BIND DNS Zone Upload / Import](#)
- [PowerDNS Zone Import](#)
- [InfoBlox Zone Import](#)
- [NS One Zone Import](#)
- [Dyn DNS Zone Import](#)
- [DNSMadeEasy Zone Import](#)

BIND DNS Zone Upload / Import

BIND DNS Zone Import

The [BIND DNS Zone Upload / Import](#) tool uses the named.conf configuration file tied to the zones you are uploading, a .zip or .tar file of the zones themselves, and an optional .csv file mapping zones to customers. The following steps are used when importing BIND DNS zones:

- BIND DNS Zone Import
 - [Preparing your DNS Zones for Import](#)
 - [Importing your DNS Zones \(BIND\)](#)
 - [Video Walkthrough](#)
 - [Step 1: Create a new DNS Import Job](#)
 - [Step 2: Map Data Columns \(Optional\)](#)
 - [Step 3: Reviewing Data](#)
 - [Step 4: Execute Import](#)

Preparing your DNS Zones for Import

If your zone data is currently in BIND format - this is very straightforward.

There are three components for the upload process:

1) The named.conf configuration file tied to the zones you are uploading (required)

This tells the importer the Zone Name and where the zone file is written. It could be as simple as a multi-line file:

Simple DNS Config File

```
zone "my-zone.com" { type master; file "my-zone.com.zone"; };
zone "my-other-zone.com" { type master; file "my-other-zone.com.zone"; };
zone "my-third-zone.com" { type master; file "my-third-zone.com.zone"; };
```

or could be more complex like this file structure directory:

Complex DNS Config File

```
zone "my-zone.com" { type master; file "/usr/local/zones/my-zone.com.zone"; };
zone "my-other-zone.com" { type master; file
"/usr/local/zones/more/my-other-zone.com.zone"; };
zone "my-third-zone.com" { type master; file "/usr/local/zones/more/even
more/my-third-zone.com.zone"; };
```

This configuration file can be taken directly from the DNS server, and can be in either ISC BIND or NSD format. The system auto-detects which one is being supplied.

For a sample Simple Config: [conf.conf](#)

2) A ZIP or TAR file of the DNS zones themselves (required)

This is as it sounds - a file archive where we can find the zones and it should match the configuration file uploaded in Step 1.

Zone Order

These zone files can be in any order, or in sub-directories, so long as the configuration file (Step 1) correctly points to them

For a sample simple ZIP: [zones.zip](#)

3) Match CSV for assigning DNS Zones to Resources (optional)

This file allows the administrator to "assign" zone files to a given Resource. If you have Imported a group of Resources, they have Resource IDs

associated with them. You can then import DNS zones and assign them to those Resource IDs. When complete, you will be able to pull up the Resource Record and see the DNS Zones associated to that Resource ID.

```
Sample CSV File  
my-zone.com,test-01,fun stuff, 174.23.14.4, 174.23.14.9  
my-otherzone.com,test-02,great stuff, dns1.dns.net, dns2.dns.net  
even-reverse-zones.arpa,test-03,amazing stuff
```

Note the columns are the "Zone Name", the "Resource ID", "Notes", "Master Server", "Slave Server"

Importing DNS Server Linkages
When importing zones, you can use the "Master Server" and "Slave Server" columns to assign zones to specified DNS Servers. Please note that the IP address or FQDN of the DNS Server is supported in this field.

To successfully map to a DNS server, that server must already exist within Provision.

For a sample CSV: [config.csv](#)

Importing your DNS Zones (BIND)

Video Walkthrough

Step 1: Create a new DNS Import Job

Navigate to the **Data Import** Tab from the **Admin** button to import your data. Select "BIND Zone Upload/Import" under "DNS Import".

Under the "New Import" section, select the **DNS Group** under which you want the zones to be imported, then create a Job Name and Description for the import. This is especially useful to keep track of progress in cases the data arrives from multiple sources, or will require multiple stages of manual review.

Select the appropriate **Configuration File** (required if the .zip is not a flat archive file), **Archive File** (required), and **CSV File** (optional) that you prepared above by selecting the "Choose File" button(s) under each section, and browsing to the correct file location. Then hit "Start Import".

New Import

The DNS Import accepts an archive file of zones (ZIP or TAR) in both flat and hierarchical formats. You may also submit a CSV file mapping zone names to customer ids and DNS servers. Please make sure the archive file has an appropriate file extension, and that all files are encoded in UTF-8.

DNS Group: BIND Import Group

Job Name: Sample Import

Description: July Import

Configuration File:

Choose File No file chosen

Archive File:

Choose File No file chosen

CSV File:

Choose File No file chosen

Optional: a configuration file in BIND or NSD format. If it is not provided the ZIP or TAR must be a flat archive from zone files.

Required: a ZIP or TAR of your zones.

Optional: a CSV file mapping zones to customers and DNS Servers.

Start Import

Working with Large or Multiple Data Sets

Although you cannot add new files to an existing job, for jobs with multiple sources for data (which may have different formatting), you can simply create separate jobs and descriptions for each source - no need to manually combine the data into one file before importing. The Import tool's mapping and editing functions will allow for the data to be reconciled in ProVision.

For large data sets where multiple stages of manual review might be needed, you can create a new job using the same set of data files in order to work in parallel on a different portion of the data.

After importing, the new job will appear under the "Existing Jobs" section. To continue working with this job, select it from the list and the next step will appear on the page.

DNS Zone Import

Existing Jobs

Sample Zone Import last modified 17-04-2017 2:01 PM

New Import

The DNS Import accepts an archive file of zones (ZIP or TAR) in both flat and hierarchical formats. You may also submit a CSV file mapping zone names to customer ids and DNS servers. Please make sure the archive file has an appropriate file extension, and that all files are encoded in UTF-8.

DNS Group: DNS Group 1

Job Name: Sample Zone Import

Description: Sample Zones

Configuration File:

Choose File No file chosen

Archive File:

Choose File No file chosen

CSV File:

Choose File No file chosen

Required: a configuration file in BIND or NSD format.

Required: a ZIP or TAR of your zones.

Optional: a CSV file mapping zones to customers and DNS Servers.

Start Import

Step 2: Map Data Columns (Optional)

If you chose to load an optional match CSV file to assign DNS Zones to Resource, a mapping step will be available. Otherwise, proceed to Step 3: Reviewing Data.

For DNS imports, two column definitions are available: **Zone** and **Resource Holder ID**. Using the dropdown menu, select the appropriate column for the zone name and Resource Holder (customer) associated with zone. The Resource Holder ID field will be used to set the Parent Resource of the individual zone once imported.

Server associations will not be imported. Instead, the associated server will be the server attached to the selected DNS Group.

Other columns which do not apply under the available definitions should be left as blank, and will be skipped during the upload process.

When completed, hit "Next".

Define Columns

The Import process requires you to enumerate the function of the columns in the provided CSV.

Zone	Resource Holder ID			
Zone Name	Resource Id	Notes	Master Server	Slave Server
citi.com	test-01	fun stuff	208.39.106.184	
citibank.com	test-02	great stuff	208.39.106.99	208.39.106.184
citigroup.com	test-03	amazing stuff	208.39.106.184	208.39.106.82

Next

Step 3: Reviewing Data

After supplying the file set and defining columns (if applicable), a review step is provided. The configuration file is broken into individual jobs, scanned for errors, and shown by row (in batches of 100) to be reviewed. Zones with errors will show as color coded, and can be filtered to be viewed by All, Valid, Warnings, Invalid, or Ignored. From here, the zone can be edited or ignored.

Review Data

Please review the data for correctness. Invalid and ignored rows will be skipped.

View:

Zone: citi.com Resource Holder: test-01

Zone: citibank.com Resource Holder: test-02

Zone: citigroup.com Resource Holder: test-03

Import Data

When you have reviewed the data import job for accuracy, hit the Execute Import button. All rows which are disabled, invalid, have warnings, or were previously successful will be passed over. Successful import rows will be marked as such.

To edit the zone name or select a different Resource Holder, hit "Edit" on the zone record.

After editing, hit "Save", and continue reviewing / editing data as desired.

Review Data
Please review the data for correctness. Invalid and ignored rows will be skipped.

View:

Zone: citi.com Resource Holder: test-01

Zone Name: Resource Holder:

Zone: citigroup.com Resource Holder: test-03

Import Data
When you have reviewed the data import job for accuracy, hit the Execute Import button. All rows which are disabled, invalid, have warnings, or were previously successful will be passed over. Successful import rows will be marked as such.

Step 4: Execute Import

When the review step is completed, hit the "Execute Import" button. A progress bar will appear to show progress and note errors if they occur.

Review Data
Please review the data for correctness. Invalid and ignored rows will be skipped.

View:

Zone: citi.com Resource Holder: test-01

Zone: citibank.com Resource Holder: test-02

Zone: citigroup.com Resource Holder: test-03

Import Data
When you have reviewed the data import job for accuracy, hit the Execute Import button. All rows which are disabled, invalid, have warnings, or were previously successful will be passed over. Successful import rows will be marked as such.

When the bar reaches 100%, the import is complete.

Import Data

When you have reviewed the data import job for accuracy, hit the Execute Import button. All rows which are disabled, invalid, have warnings, or were previously successful will be passed over. Successful import rows will be marked as such.

Current Block: citigroup.com.

PowerDNS Zone Import

PowerDNS Zone Import

The PowerDNS Zone Import Option is available after configuring a PowerDNS server with a MySQL backend. It connects to the selected server and imports all zones.

- PowerDNS Zone Import
 - Step 1: Verify PowerDNS server setup
 - Step 2: Import your PowerDNS zones

Step 1: Verify PowerDNS server setup

To import PowerDNS zones, first ensure the PowerDNS server has been set up under the [DNS](#) Tab, DNS Servers section (see: [Working with DNS Servers](#) and [configuring a PowerDNS server](#)).

The screenshot shows a web interface for configuring DNS servers. At the top, there are three tabs: 'DNSv3', 'DNS Groups', and 'DNS Servers', with 'DNS Servers' circled in red. Below the tabs is the 'Server Settings' section. A blue bar labeled 'Scheduled Tasks' is at the top of the settings area. The settings are organized into sections: 'Common Settings', 'Display Name' (with a text input field), 'FQDN or IP' (with a text input field), 'Server Type' (a dropdown menu set to 'Master'), 'DNS Service' (a dropdown menu set to 'PowerDNS Bind' with a red arrow pointing to it), and 'Parent Resource' (a dropdown menu set to 'TLR').

Step 2: Import your PowerDNS zones

Once server setup has been verified, navigate to the [Data Import](#) Tab in the Admin section. Select the "Power DNS Zone Import" link.

Resource Import:
Simple Upload/Import from CSV
Resource Import Tool "Beta"

Import Templates:
All Import Samples
IP Import Sample File
Customer Import Sample File

Peering Import
Import BGP Sessions

IP Import:
Upload/Import from CSV
Import from RIR

DNS Import:
BIND Zone Upload/Import
PowerDNS Zone Import
InfoBlox Zone Import
NS One Zone Import
Dyn DNS Zone Import
DNSMadeEasy Zone Import

Then, to import your data simply choose your PowerDNS server and click "Import".

This operation will pull all zones on the target server.

This operation may take quite some time.

Choose a server: 208.39.104.106 

InfoBlox Zone Import

InfoBlox Zone Import

The ProVision Data Import InfoBlox option imports InfoBlox DNS zones using a provided Host, Username, and Password. It pulls all zones on the InfoBlox LOCAL grid and adds them to a designated [DNS Group](#). It is advised to [create a DNS Group](#) prior to the import with default parameters and NS records to be inherited by the imported records.

- [InfoBlox Zone Import](#)
 - [Step 1: Verify DNS Group setup](#)
 - [Step 2: Verify InfoBlox server setup](#)
 - [Step 3: Import your InfoBlox zones](#)

Step 1: Verify DNS Group setup

It is recommended to have a DNS Group created in advance with the proper default parameters and records to be inherited by the imported InfoBlox zones and records.

Review the existing DNS Groups in the [DNS](#) tab, and create a new DNS Group if necessary. See [Working with DNS Groups](#) for details on editing or creating DNS Groups.

Step 2: Verify InfoBlox server setup

Although it is not strictly necessary to have the InfoBlox server created in ProVision prior to import, creating or verifying the server at this point gives you an opportunity to test the connection and attach the InfoBlox server to the DNS Group selected in step 1.

Go to the [DNS](#) Tab, DNS Servers section, and either verify that the desired server is shown in the server list, or click the "Add Server" button to create a new InfoBlox server.

If creating a new server, ensure that "InfoBlox" is selected for the DNS Service.

Server Settings :

Scheduled Tasks

Common Settings

Display Name:
Enter Display Name
This is the server name that will appear in the DNS interface.

FQDN or IP:
ex: ns1.dns5connect.net or 216.239.32.10
DNS server real FQDN or IP Address.

Server Type:
Master

DNS Service:
InfoBlox

Parent Resource:
TLR
The new server resource will be a child of the Parent Resource.

InfoBlox Settings [Test Server](#)

Under the "DNS Group Settings" section of the server detail page, ensure that the DNS Group from step 1 is selected as the server's Attach to Group setting, and click "Save".

DNS Group Settings

Export Groups as Views: OFF
Check this option if you want to enable the support of different DNS Groups to be exported as Views.

Attach to Group:
DNS Group 1

If you select a default DNS group to your server, the zones assigned to this group will be automatically attached to the server.

[Save changes](#)

Step 3: Import your InfoBlox zones

Once server setup has been verified, navigate to the [Data Import](#) Tab in the Admin section. Select the "InfoBlox Zone Import" link.

<p>Resource Import: Simple Upload/Import from CSV Resource Import Tool *Beta*</p> <p>Import Templates: All Import Samples IP Import Sample File Customer Import Sample File</p> <p>Peering Import Import BGP Sessions</p>	<p>IP Import: Upload/Import from CSV Import from RIR</p> <p>DNS Import: BIND Zone Upload/Import PowerDNS Zone Import InfoBlox Zone Import NS One Zone Import Dyn DNS Zone Import DNSMadeEasy Zone Import</p>
--	---

Then, enter the InfoBlox server Host, Username, and Password. Select Forward or Reverse zone type, the InfoBlox view, and the ProVision DNS Group to add the zones to.

Once all information has been entered, click the "Import" button.

This operation will pull all zones on the InfoBlox LOCAL grid.
This operation may take quite some time.

In order to import the zones it is highly advised to create a group with default parameters and NS records to be inherited by the imported records.

InfoBlox GRID Auth Options:

Server Host: ←

Server Username: ←

Server Password: ←

Import Options:

Authoritative zones type: Forward Reverse ←

InfoBlox view: ←

Add to Group: ←

Import

The import may take a couple of minutes. If errors occur, they will show under the Pull in Progress message.

When completed, a successful import will show a green **Complete! status message**.

Verify the zones by exiting the Admin area of ProVision, clicking on the **DNS** tab, and reviewing the zones under the Group previously selected for the import.

NS One Zone Import

NS One Zone Import

The ProVision "NS One Data Import" option imports NS One DNS zones using a provided NS One API key. It is advised to [create a DNS Group](#) prior to the import with default parameters and NS records to be inherited by the imported records.

- NS One Zone Import
 - Step 1: Verify DNS Group setup
 - Step 2: Verify NS One server setup
 - Step 3: Import your zones

Step 1: Verify DNS Group setup

It is recommended to have a DNS Group created in advance with the proper default parameters and records to be inherited by the imported NS One zones and records.

Review the existing DNS Groups in the [DNS](#) tab, and create a new DNS Group if necessary. See [Working with DNS Groups](#) for details on editing or creating DNS Groups.

Step 2: Verify NS One server setup

Although it is not strictly necessary to have the NS One server created in ProVision prior to import, creating or verifying the server at this point gives you an opportunity to test the connection and attach the NS One server to the DNS Group selected in step 1.

Go to the [DNS](#) Tab, DNS Servers section, and either verify that the desired server is shown in the server list, or click the "Add Server" button to create a new NS One server.

The screenshot shows a web interface for managing DNS servers. At the top, there are three tabs: "DNSv3", "DNS Groups", and "DNS Servers". Below the tabs, the title "DNS Server List" is displayed next to a green "Add Server" button. A table lists the existing servers with the following columns: Server Name, Server Backend, Server Type, Server Status, and Actions. Two servers are listed:

Server Name	Server Backend	Server Type	Server Status	Actions
6c BIND QA Server	ISCBIND	master		Delete Push
6c Infoblox test VM	INFOBLOX	master		Delete Push

If creating a new server, ensure that "NS One" is selected for the DNS Service.

Server Settings :

Scheduled Tasks

Common Settings

Display Name:

This is the server name that will appear in the DNS interface.

FQDN or IP:

DNS server real FQDN or IP Address.

Server Type:**DNS Service:****Parent Resource:**

The new server resource will be a child of the Parent Resource.

Under the "DNS Group Settings" section of the server detail page, ensure that the DNS Group from step 1 is selected as the server's Attach to Group setting, and click "Save".

DNS Group Settings

Export Groups as Views: OFF

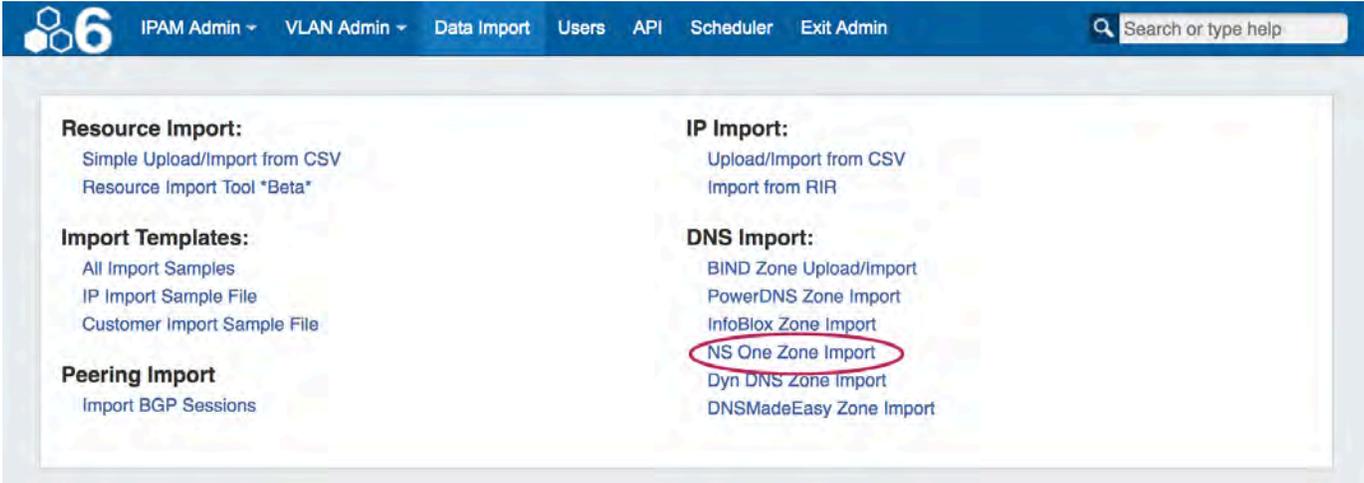

Check this option if you want to enable the support of different DNS Groups to be exported as Views..

Attach to Group:

If you select a default DNS group to your server, the zones assigned to this group will be automatically attached to the server.

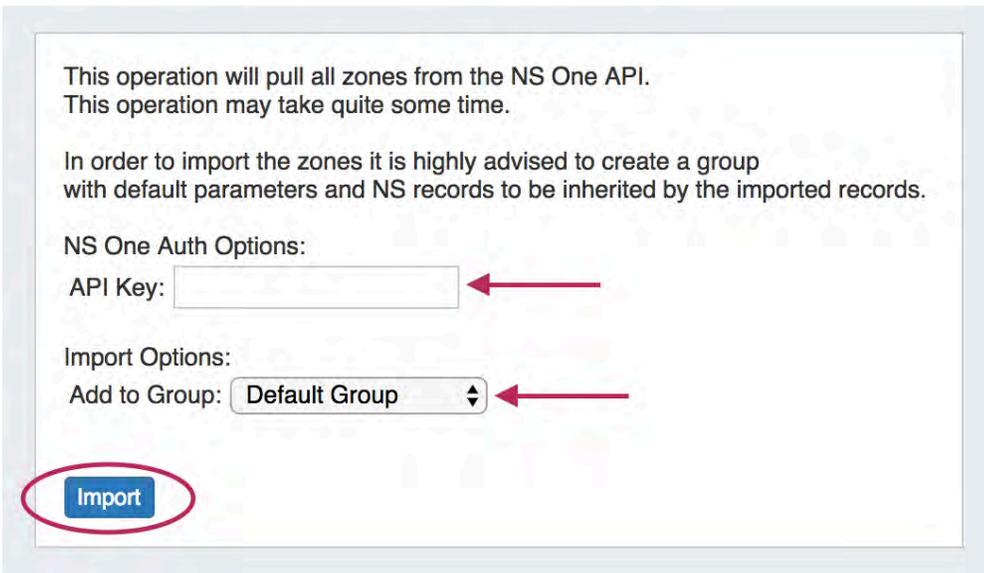

Step 3: Import your zones

Once server setup has been verified, navigate to the [Data Import](#) Tab in the Admin section. Select the "NS One Zone Import" link.

Then, enter the NS One API key and the ProVision DNS Group to add the zones to.

Once all information has been entered, click the "Import" button.

The import may take a couple of minutes. If errors occur, they will show under the Pull in Progress message.

When completed, a successful import will show a green **Complete! status message**.

Verify the zones by exiting the Admin area of ProVision, clicking on the **DNS** tab, and reviewing the zones under the Group previously selected for the import.

Dyn DNS Zone Import

Dyn DNS Zone Import

The ProVision "Dyn DNS Zone Import" option imports Dyn DNS zones using a provided Customer Name, Username, and Password. It is advised to create a DNS Group prior to the import with default parameters and NS records to be inherited by the imported records.

- Dyn DNS Zone Import
 - Step 1: Verify DNS Group setup
 - Step 2: Verify server setup
 - Step 3: Import your DynDNS zones

Step 1: Verify DNS Group setup

It is recommended to have a DNS Group created in advance with the proper default parameters and records to be inherited by the imported Dyn DNS zones and records.

Review the existing DNS Groups in the [DNS](#) tab, and create a new DNS Group if necessary. See [Working with DNS Groups](#) for details on editing or creating DNS Groups.

Step 2: Verify server setup

Although it is not strictly necessary to have the Dyn DNS server created in ProVision prior to import, creating or verifying the server at this point gives you an opportunity to test the connection and attach the Dyn DNS server to the DNS Group selected in step 1.

Go to the [DNS](#) Tab, DNS Servers section, and either verify that the desired server is shown in the server list, or click the "Add Server" button to create a new Dyn DNS server.

The screenshot shows a web interface for managing DNS servers. At the top, there are three tabs: "DNSv3", "DNS Groups", and "DNS Servers". Below the tabs, the title "DNS Server List" is displayed next to a green "Add Server" button. A table lists the existing servers with columns for Server Name, Server Backend, Server Type, Server Status, and Actions.

Server Name	Server Backend	Server Type	Server Status	Actions
6c BIND QA Server	ISCBIND	master		Delete Push
6c Infoblox test VM	INFOBLOX	master		Delete Push

If creating a new server, ensure that "Dyn DNS" is selected for the DNS Service.

Server Settings :

Scheduled Tasks

Common Settings

Display Name:

This is the server name that will appear in the DNS interface.

FQDN or IP:

DNS server real FQDN or IP Address.

Server Type:**DNS Service:****Parent Resource:**

The new server resource will be a child of the Parent Resource.

Under the "DNS Group Settings" section of the server detail page, ensure that the DNS Group from step 1 is selected as the server's Attach to Group setting, and click "Save".

DNS Group Settings

Export Groups as Views: OFF

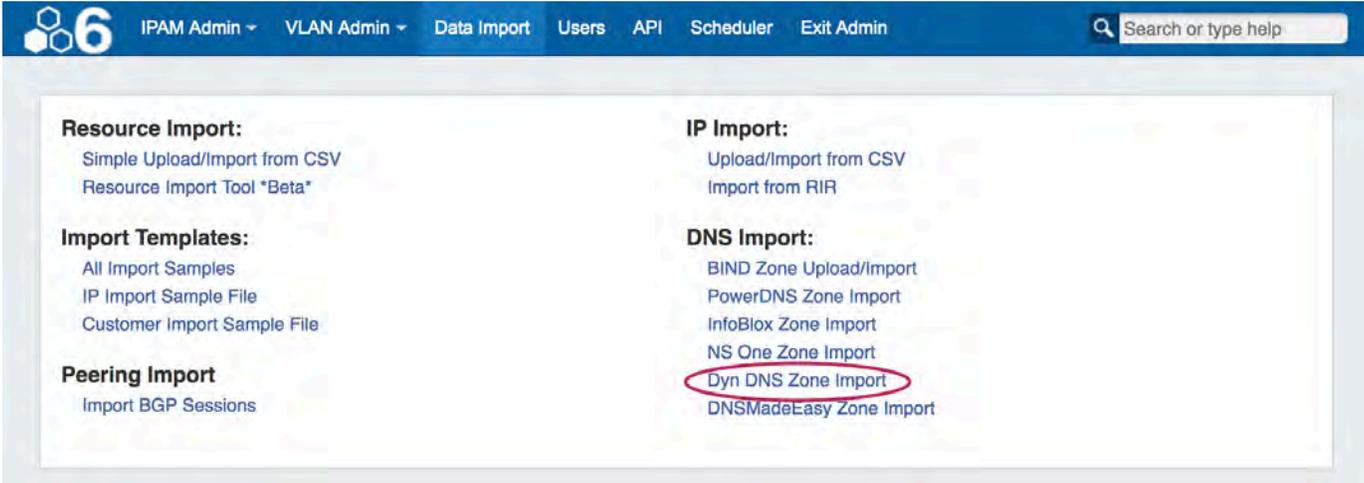

Check this option if you want to enable the support of different DNS Groups to be exported as Views.

Attach to Group:

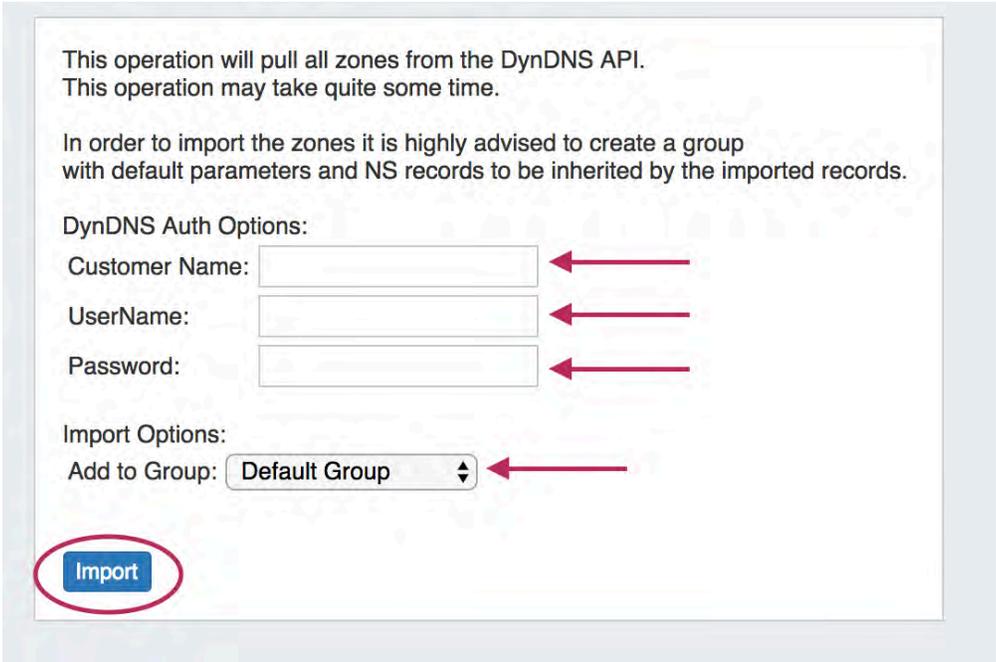

If you select a default DNS group to your server, the zones assigned to this group will be automatically attached to the server.

Step 3: Import your DynDNS zones

Once server setup has been verified, navigate to the [Data Import](#) Tab in the Admin section. Select the "Dyn DNS Zone Import" link.

Then, enter the Dyn DNS Customer Name, Username, and Password. Then, select the ProVision DNS Group to add the zones to. Once all information has been entered, click the "Import" button.

The import may take a couple of minutes. If errors occur, they will show under the Pull in Progress message. When completed, a successful import will show a green **Complete! status message**. Verify the zones by exiting the Admin area of ProVision, clicking on the **DNS** tab, and reviewing the zones under the Group previously selected for the import.

DNSMadeEasy Zone Import

DNSMadeEasy Zone Import

The ProVision "DNSMadeEasy Zone Import" option imports DNSMadeEasy zones using a provided API Key and API Secret. It is advised to create a DNS Group prior to the import with default parameters and NS records to be inherited by the imported records.

- DNSMadeEasy Zone Import
 - Step 1: Verify DNS Group setup
 - Step 2: Verify server setup
 - Step 3: Import your DNSMadeEasy zones

Step 1: Verify DNS Group setup

It is recommended to have a DNS Group created in advance with the proper default parameters and records to be inherited by the imported zones and records.

Review the existing DNS Groups in the [DNS](#) tab, and create a new DNS Group if necessary. See [Working with DNS Groups](#) for details on editing or creating DNS Groups.

Step 2: Verify server setup

Although it is not strictly necessary to have the DNSMadeEasy server created in ProVision prior to import, creating or verifying the server at this point gives you an opportunity to test the connection and attach the DNSMadeEasy server to the DNS Group selected in step 1.

Go to the [DNS](#) Tab, DNS Servers section, and either verify that the desired server is shown in the server list, or click the "Add Server" button to create a new DNSMadeEasy server.

The screenshot shows a web interface for managing DNS servers. At the top, there are tabs for "DNSv3", "DNS Groups", and "DNS Servers". Below the tabs, the title "DNS Server List" is displayed next to a green "Add Server" button. A table lists the existing servers with columns for Server Name, Server Backend, Server Type, Server Status, and Actions.

Server Name	Server Backend	Server Type	Server Status	Actions
6c BIND QA Server	ISCBIND	master		Delete Push
6c Infoblox test VM	INFOBLOX	master		Delete Push

If creating a new server, ensure that "DNSMadeEasy" is selected for the DNS Service.

Server Settings :

Scheduled Tasks

Common Settings

Display Name:

This is the server name that will appear in the DNS interface.

FQDN or IP:

DNS server real FQDN or IP Address.

Server Type:**DNS Service:****Parent Resource:**

The new server resource will be a child of the Parent Resource.

Under the "DNS Group Settings" section of the server detail page, ensure that the DNS Group from step 1 is selected as the server's Attach to Group setting, and click "Save".

DNS Group Settings

Export Groups as Views: OFF

Check this option if you want to enable the support of different DNS Groups to be exported as Views.

Attach to Group:

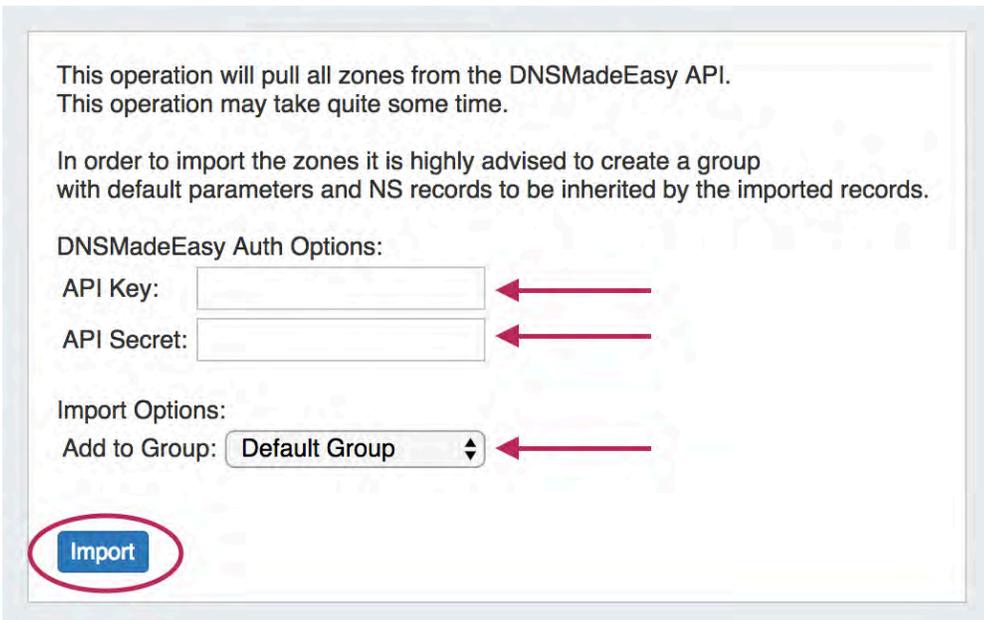

If you select a default DNS group to your server, the zones assigned to this group will be automatically attached to the server.

Step 3: Import your DNSMadeEasy zones

Once server setup has been verified, navigate to the [Data Import](#) Tab in the Admin section. Select the "DNSMadeEasy Zone Import" link.

Then, enter the DNSMadeEasy API Key, Secret Key, and the ProVision DNS Group to add the zones to. Once all information has been entered, click the "Import" button.

The import may take a couple of minutes. If errors occur, they will show under the Pull in Progress message.

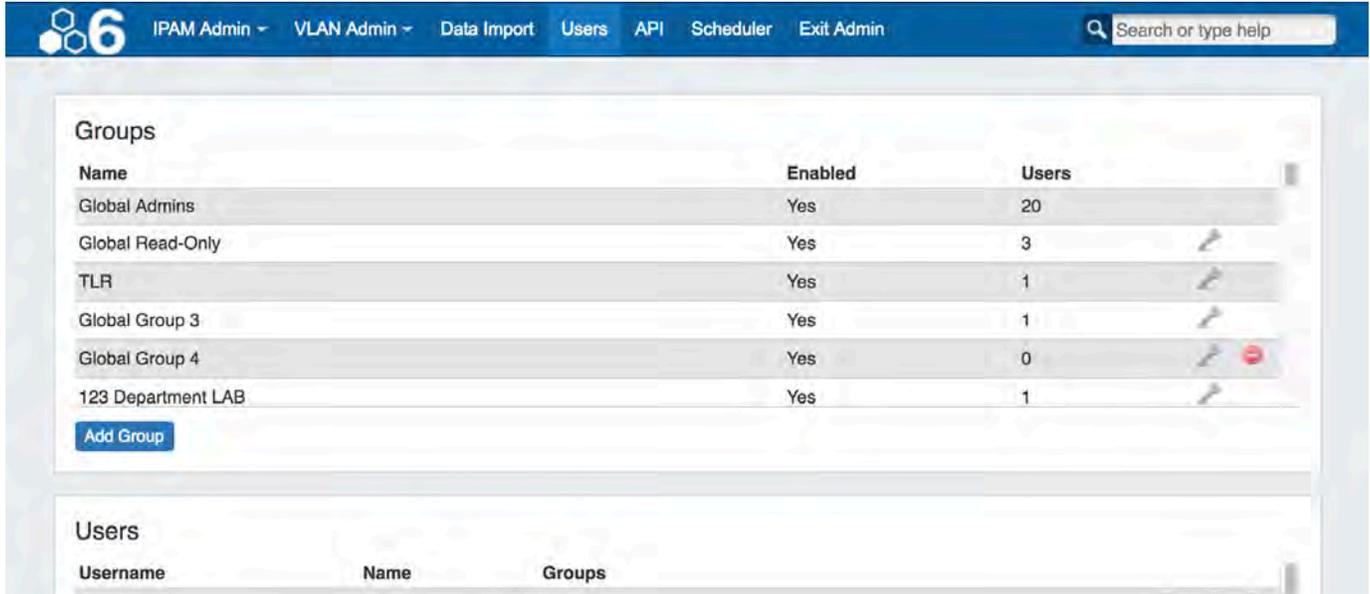

When completed, a successful import will show a green **Complete!** status message.

Verify the zones by exiting the Admin area of ProVision, clicking on the **DNS** tab, and reviewing the zones under the Group previously selected for the import.

Users & Permissions

Overview

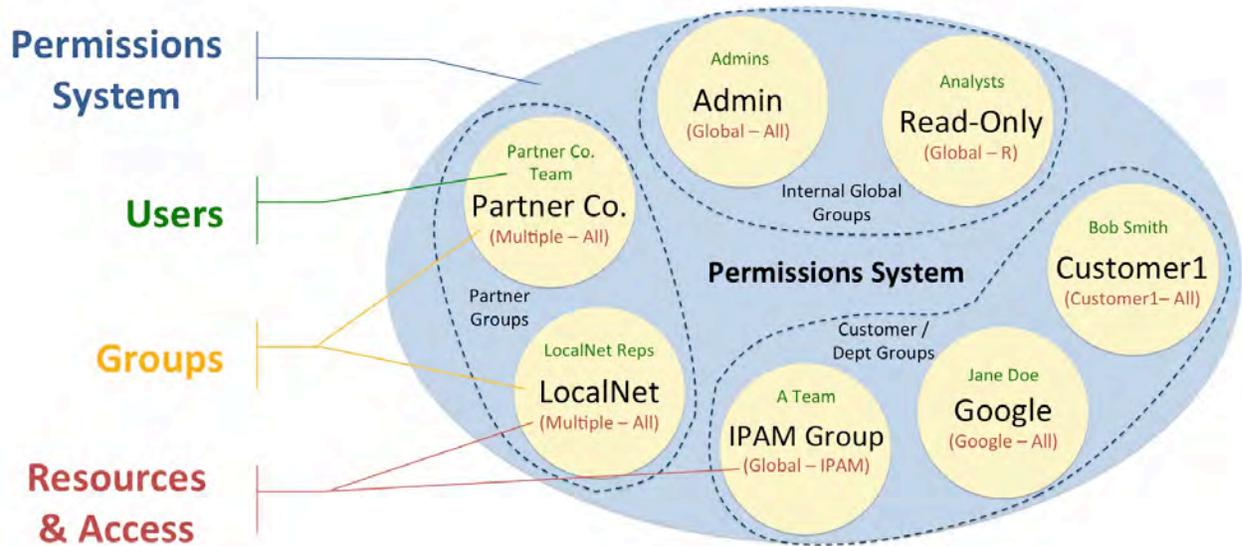

Users & Permissions is accessed from the Admin screen under the **Users** tab. Here, you will find tools for adding and managing permissions groups, users, and running queries for verifying a user's specific permissions.

The Permissions Structure

The Permissions structure in ProVision is designed to give you as much flexibility as you need to accommodate most use cases. When mapping out the permissions structure for your organization, keep in mind who you want to access to application:

- Internal Users and Roles (Admins, Read Only, etc.)
- Partners related to multiple specific Resources/Accounts
- Customers/Departments with limited view to only their respective Resources/Accounts

In this diagram, we have created groups for each of those scenarios – we have internal groups, Partner Groups, and Customer groups. Each of these groups has access to different resources, permission levels, and users assigned to them.

The components of the Permissions System include:

Users: A User is a single login account that accesses ProVision. Users are assigned to Groups.

Groups: A Group is a set of permission conditions that apply to selected Users. Allowed Resources and access levels (C/R/U/D permissions) are set inside the Group.

Resources & Access: Inside a Group, Resource access may be set to Global (applies to all Resources), or to the Resource level (applies to only the selected Resources). For each Resource selected, access permissions can be set with C/R/U/D permissions under each ProVision functional area (IPAM, DNS, Resource, Peering).

As a whole, this makes up the ProVision permissions system. The Permissions system allows you to fine-tune access to resource data to be as detailed as you need.

Video Overview

Video overview applicable to ProVision version 5.3.3 and earlier.

Permission Levels

Global Permissions

When you see a reference to a "TLR" - that is a "Top Level Resource". This is the primary Resource under which all other resources fall under. ProVision currently only allows a single level of administrator permissions: Global Administrator.

Users with "Admin" access can assign/modify permissions for other users.

See [Global Permissions](#) for more details on configuring these elements.

Resource Permissions

An administrator can also set respective permissions for a given Resource (single or multiple). These permissions fall under Groups. So a Group

is configured for the given group of Resource permissions, and then the User account is added.

See [Users and Groups](#) to learn how Resource Permissions are assigned.

See [Resource Permissions](#) for more details on configuring these elements.

Table of contents:

- [Global Permissions](#)
- [Resource Permissions](#)
- [Users and Groups](#)
- [Verifying Permissions](#)

Global Permissions

Global Permissions

Global Permissions apply to the "TLR" or "Top Level Resource" within ProVision. By default, ProVision includes two groups with Global Permissions access - Global Admins and Global Read-Only. Initial Users are typically placed in the "Global Admins" group, and have administrative access to the entire platform. Global Read-Only users have full access to the platform, but with only read permissions.

Administration of these permissions require Administrative privileges. As an Admin, the user can then assign global permissions to groups and users. Depending on the requirement, the user can also have Resource specific permissions depending on how their group is configured.

Global Permission Details

Global groups are visible under the "Groups" section of the **Users** tab. In addition to the two default Global groups, new Global groups may be created through the "Add Group" button.

Under the resource selector, chose the "TLR" Resource ("Top Level Resource"), and then check permissions as desired.

Group Information

Name:

Enabled:

Resource Permissions (Show Details)

Resource	IPAM	Peer	Resource	User
TLR	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

[Add More Group Permissions](#)

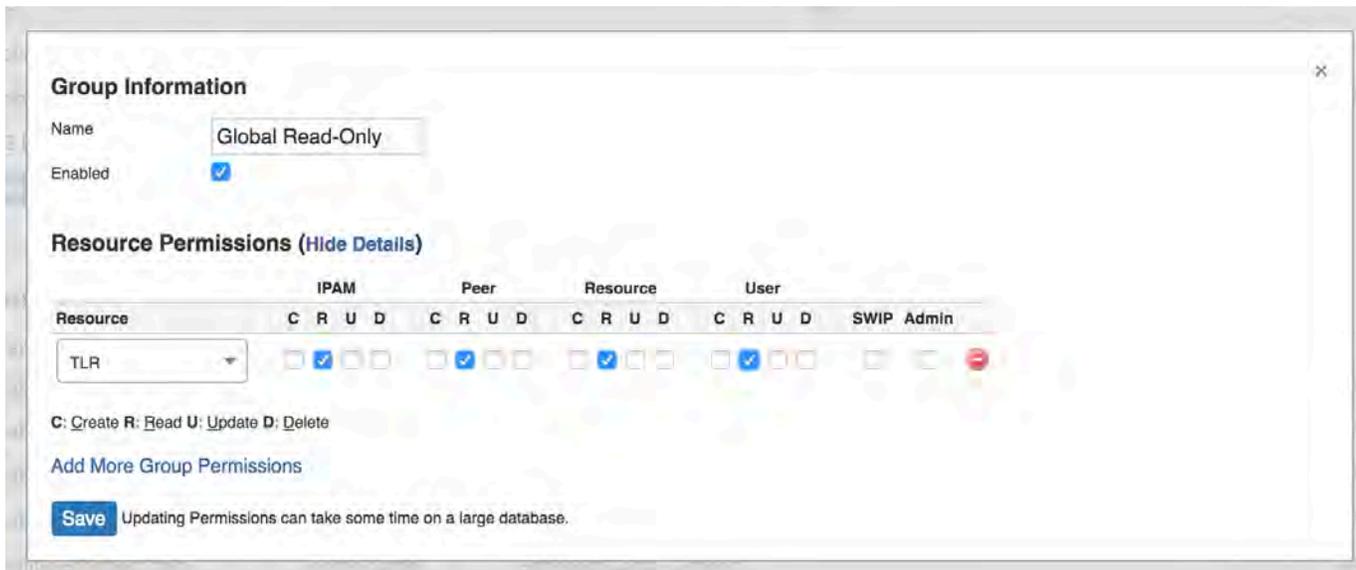

Save Updating Permissions can take some time on a large database.

Global groups may also be edited just like standard groups, through selecting the Action Menu (Wrench Icon) to bring up the group information details. Groups may be deleted by selecting the red circle icon.

Groups	Enabled	User Count	Action
Global Admins	Yes	11	
Global Read-Only	Yes	0	
TLR	Yes	2	

Group details are the same for Global groups as for non-global groups, excepting that the resource selected is TLR (Top Level Resource). You may choose to edit the name, enable/disable the group, show or hide C/R/U/D permission details, and view users assigned to that group. Be sure to save any changes after editing.

Details on each global permission option is as follows:

Global Permission	Description
Create	Ability to create records of a certain type
Read	Ability to read records of a certain type
Update	Ability to update existing records of a certain type
Delete	Ability to delete records of a certain type

Functional Area	Description
IPAM	IP Address Management functionality - this covers the IPAM Tab in addition to the IPAM "Gadget" that can be present in Resources.
Peering	Peering functionality - covers the Peering Tab, both the Communication Manager and the Session Manager.
Resources	Resource functionality - this controls access for Resources depending on either the TLR or the individual Resource(s) selected. DNS zones, records, and servers are included as "Resources".
User	User/Group management - this controls access for User and Group functions within the administrative area for ProVision.
SWIP*	This affects the SWIP/RPSL integration for ARIN/RIPE. This way a user can either be enabled to have this capability or not.
Admin*	This controls whether a user is an administrator for the global ProVision application.

*
SWIP and Admin functions are only visible when [Show Details](#) is selected

Additional Information

For more information on Users and Groups, see the following areas:

[Users & Permissions](#)

[Resource Permissions](#)

[Users and Groups](#)

[Verifying Permissions](#)

Resource Permissions

Resource Permissions

Resource Permissions apply to designated Resources within ProVision. Rather than allowing a user full access to the ProVision platform, you can choose to limit a user's access to only certain resources or functional areas.

Administration of these permissions require Administrative privileges. As an Admin, the user can then assign resource permissions to groups and users.

Resource Permission Details

Resource Permission groups are visible under the "Groups" section of the [Users](#) tab. New groups may be created through the "Add Group" button.

Under the resource selector, chose one or more resources for which you want to define permissions, and then check permissions as desired.

Additional Resources may be added to the list by clicking on "Add more Group Permissions".

Keep in mind when working with individual Resource permissions that tasks which require moving entities (zones, IPAM blocks, attaching servers, etc) from one resource to another, require the user to have permissions on both the originating Resource and the destination Resource.

Thus, moving IP blocks from "6connect Labz" to "7connect Labs" requires the user to have IPAM and Resource permissions on both Lab resources.

Similarly, attaching a DNS server to a DNS Group requires Resource permissions on both the DNS Group and the intended DNS server to attach.

Here, we show making a group called "Some Lab Group", whose users we want to be able to access two resources: 6connect Labz and 7connect Labs.

These users will be working extensively in IPAM and Resources, so we give them full access to those areas of ProVision.

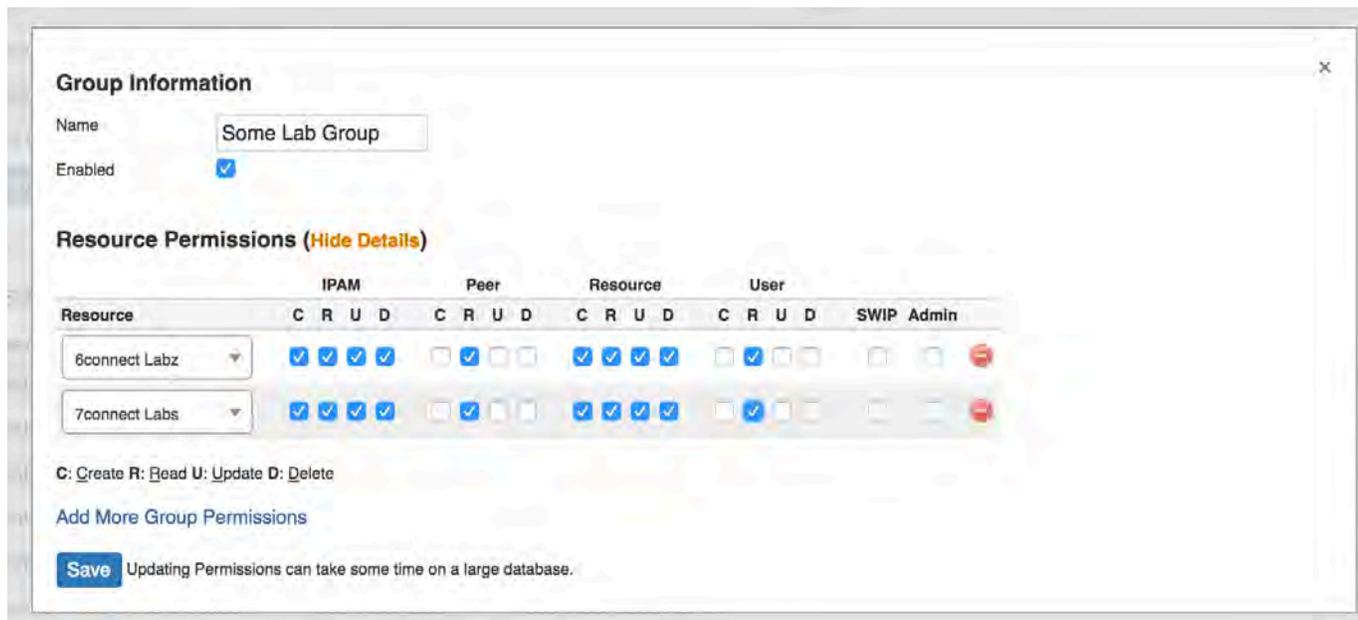

Resource	IPAM	Peer	Resource	User
6connect Labz	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
7connect Labs	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>

However, we also want them to view other information in Peering and Users, but not edit it.

Click on "Show Details" to fine-tune the permissions, and then check the "R" column under Peer and User.

Lastly, hit "Save" to save our changes.

Details on each resource permission option is as follows:

Resource Permission	Description
Create	Ability to create records of a certain type
Read	Ability to read records of a certain type
Update	Ability to update existing records of a certain type
Delete	Ability to delete records of a certain type

Functional Area	Description
IPAM	IP Address Management functionality - this covers the IPAM Tab in addition to the IPAM "Gadget" that can be present in Resources.
Peering	Peering functionality - covers the Peering Tab, both the Communication Manager and the Session Manager.
Resources	Resource functionality - this controls access for Resources depending on either the TLR or the individual Resource(s) selected. DNS zones, records, and servers are included as "Resources".
User	User/Group management - this controls access for User and Group functions within the administrative area for ProVision.
SWIP*	This affects the SWIP/RPSL integration for ARIN/RIPE. This way a user can either be enabled to have this capability or not.
Admin*	This controls whether a user is a administrator for the global ProVision application.

*
SWIP and Admin functions are only visible when [Show Details](#) is selected

Users and Groups

Managing Users and Groups

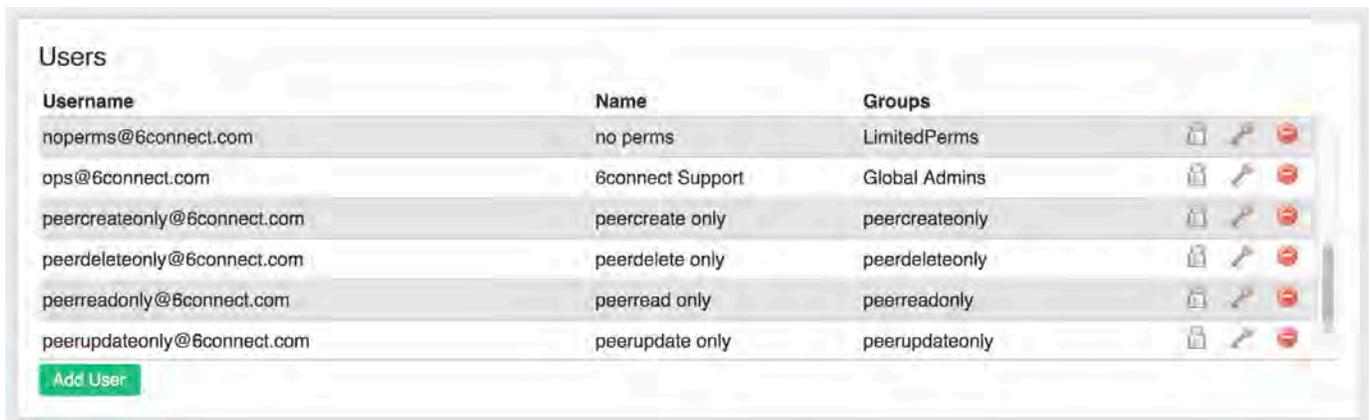

Users and Groups are managed from the Admin area of ProVision, under the **Users** tab. Both Global and Resource level groups are shown.

- Managing Users and Groups
 - Users Overview
 - Creating/Editing User Accounts
 - Setting/Resetting User Passwords
 - Removing a User
 - Groups
 - Default Groups
 - Add or Edit a Group
 - Removing a Group
 - Additional Information

Users Overview

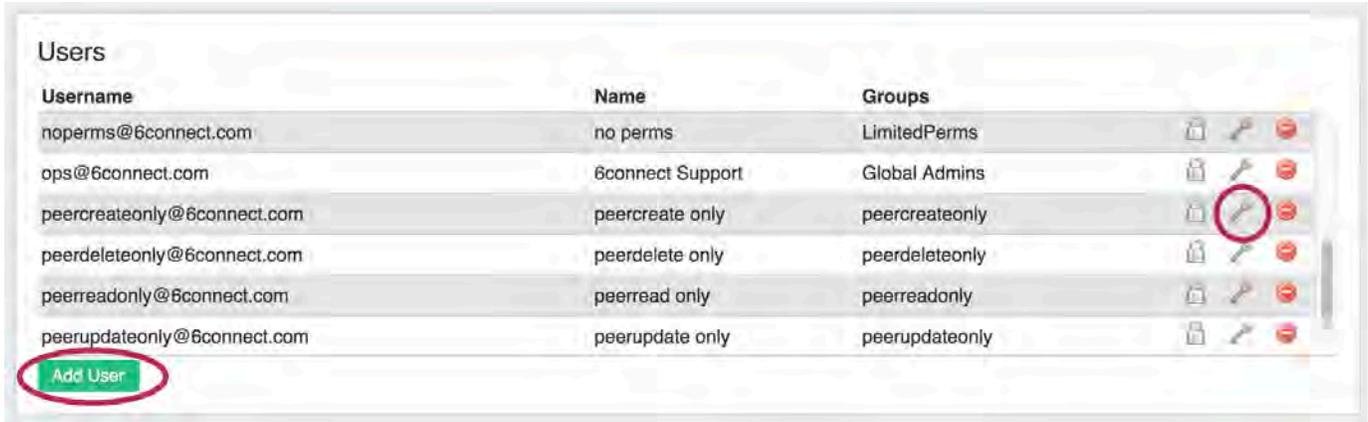

A User is defined as a single login account that accesses ProVision. In the Users section, users may be added, edited, assigned to groups, have password information reset, or be removed.

Creating/Editing User Accounts

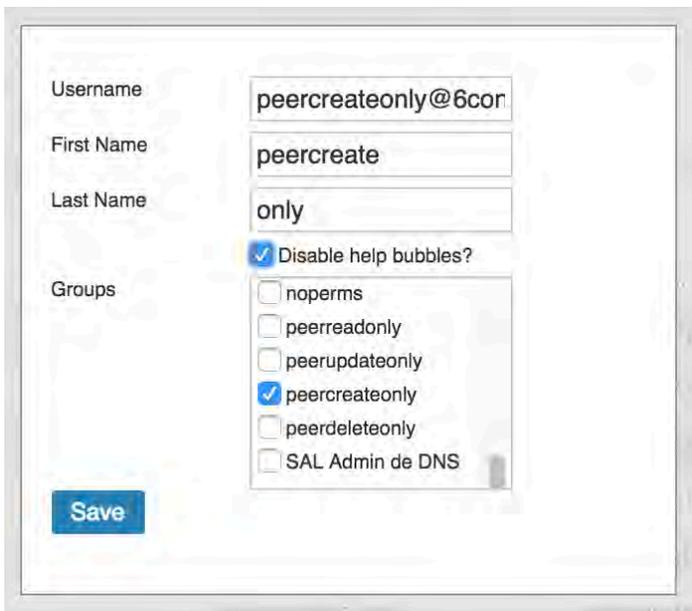

Add Users by click on the "Add User" button at the bottom of the "Users" section of the page. The Edit User dialog will pop up.

You can bring up the same dialog to edit a user's information by clicking on the Action Menu (wrench icon) at the end of the row for the user.

When creating or editing User accounts, you will be presented with the following options.

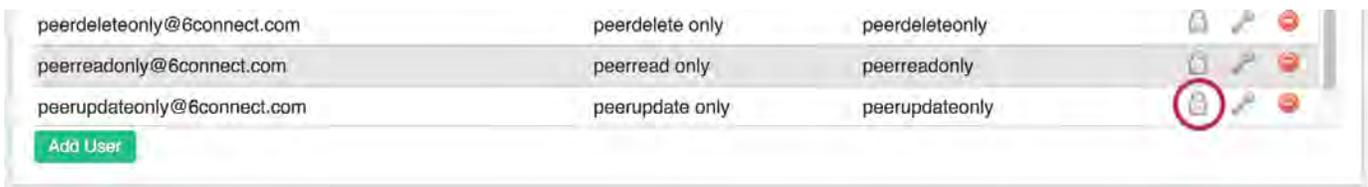

You may enter or edit the Username, First Name, Last Name, whether to enable help bubbles, and select one or more permissions groups to which to assign the user.

When assigning users to multiple permissions groups, be sure to review the group permission details to ensure that they do not conflict with each other!

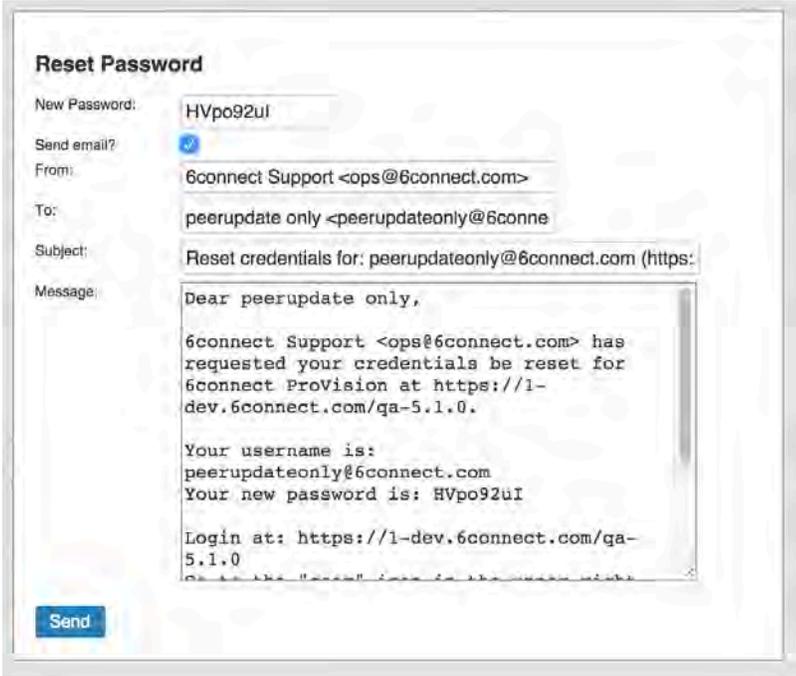

Setting/Resetting User Passwords

When you click on the padlock icon, you will be presented with options to set a new password and/or send a password reset email to the intended user account.

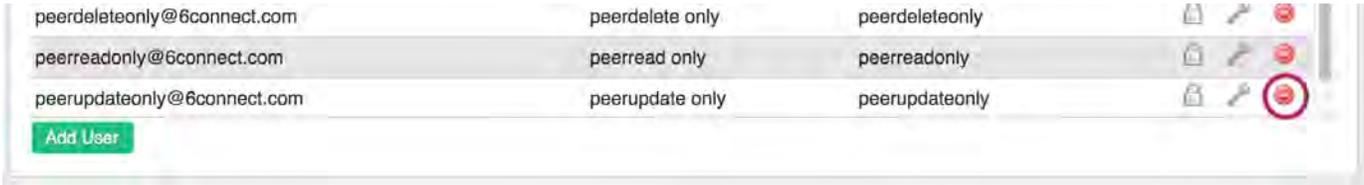

From here, you can choose a new password, or use the automatically generated random password.

If you select the checkbox next to "Send email?", email fields will appear that may be edited as desired. When complete, hit "Send".

Removing a User

To remove a user from the Users list, click on the red circle "delete" icon next to that user.

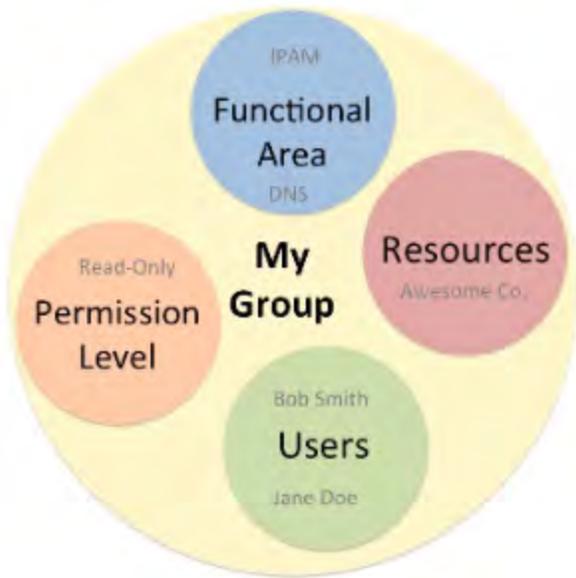

Groups

ProVision administrators can also create permission groups to assign users to. This allows more control over user roles.

A Group has four elements associated with it:

- Users:** The Users that are assigned to the group, and will be limited by the selected permissions.
- Resources:** Resources access may be set to Global TLR (applies to all resources), or to the level of individually selected resources.
- Functional Area:** The ProVision functional area (IPAM, Resources, Peering, etc) for the selected resource(s) that permissions are set under.
- Permission Level:** Create, Read, Update, and Delete (C/R/U/D) permissions may be set under each functional area for each resource selected.

In the example above, the group “MyGroup” allows the users Bob Smith and Jane Doe to only read IPAM and DNS data for the Resource “Awesome Co”.

Through the use of these four elements, Groups can create permissions structures that are as flexible as you need.

Default Groups

Two default groups are available initially in ProVision:

- Global Admin
- Global Read-Only

These Global groups allow for access to the entire ProVision platform. You may add additional Global groups by creating a new group using the TLR (Top Level Resource). You may also add detailed resource level group permissions by selected individual resources.

For more detail on top-level and resource permissions, see [Global Permissions](#) and [Resource Permissions](#).

Overlapping group and user permissions

Permissions are inherited based on the hierarchy of the objects, unless you specify a different permission!

Add or Edit a Group

New Groups can be created by ProVision administrators by pressing the green "Add Group" button. To edit a group, you may click on the Action Menu (wrench icon) for the group.

Name	Enabled	Users	
Global Admins	Yes	20	
Global Read-Only	Yes	3	
TLR	Yes	1	
Global Group 3	Yes	1	
Global Group 4	Yes	0	
123 Department LAB	Yes	1	

Add Group

After hitting the "Add Group" button or wrench icon, the Group Information screen will pop up.

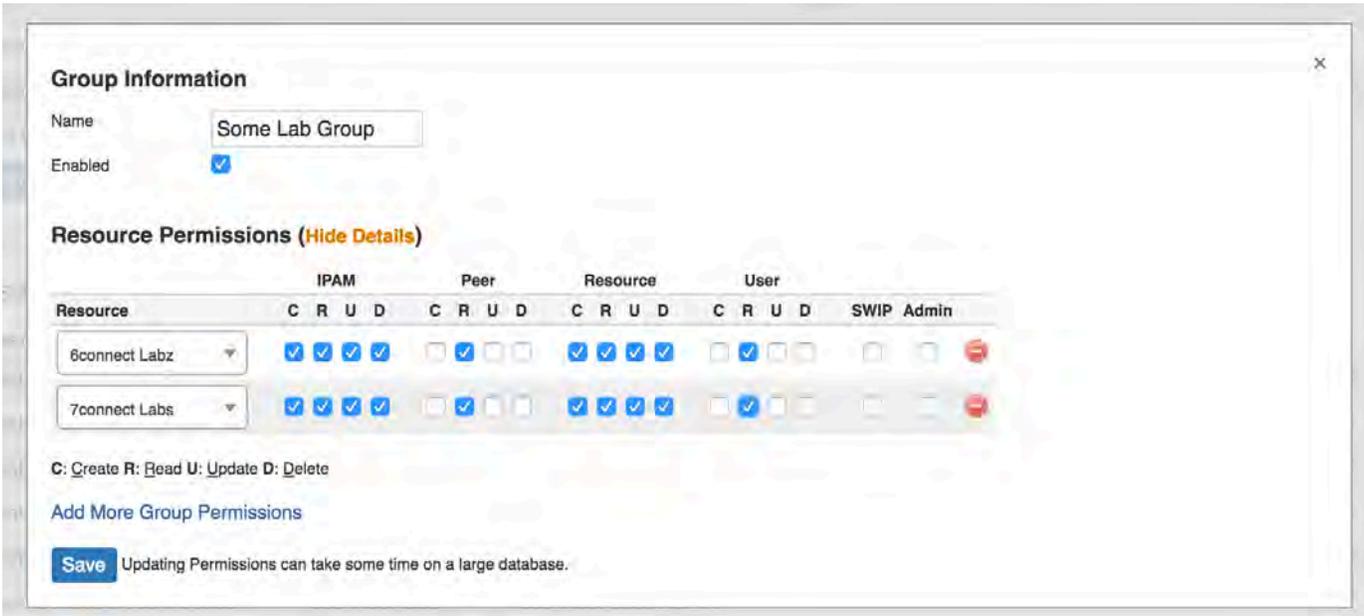

Add in the name of the new group, and set the permissions for that group by defining the resource(s) in the dropdown menu, checking the functional areas that you want accessible.

Click "Show Details" to fine tune the functional areas into Create/Read/Update/Delete level permissions.

To add permissions for additional Resources, click "Add More Group Permissions", select the Resource, and check the desired permissions.

To delete a Resource from the permissions list, simply click the red icon.

In the example below, we make a group called "Some Lab Group", whose users we want to be able to access two resources: 6connect Labz and 7connect Labs. These users will be working extensively in IPAM and Resources, so we give them full access to those areas of ProVision. However, we also want them to view other information, but not edit it. We click on "Show Details" to fine-tune the permissions, and then check the "R" column under Peer and User.

Click "Save" when complete. After adding the group, you can add users to the group by selecting the group when editing a user account.

Removing a Group

To remove a user from the Users list, click on the red circle "delete" icon next to that user.

Groups

Name	Enabled	Users	
Global Admins	Yes	20	
Global Read-Only	Yes	3	
TLR	Yes	1	
Global Group 3	Yes	1	
Global Group 4	Yes	0	 
123 Department LAB	Yes	1	

[Add Group](#)

Additional Information

[Verifying Permissions](#)

Verifying Permissions

Verifying Permissions

- Verifying Permissions
 - Check User Permissions
 - User Permissions Chart
 - Additional Information

Check User Permissions

Users & Permissions is accessed from the Admin screen under the [Users](#) tab. Here, you will find tools for adding and managing permissions groups, users, and running queries for verifying a user's specific permissions.

To verify the permissions of a certain user, simply select their user account from the dropdown menu, the resource you are checking against, and click on the green "Query" button.

The resulting output will display the detailed permissions for that user and resource combination, as well as list groups effecting the user.

IPAM		Peer		Resource		User		SWIP	Admin
C	R	U	D	C	R	U	D		
<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>

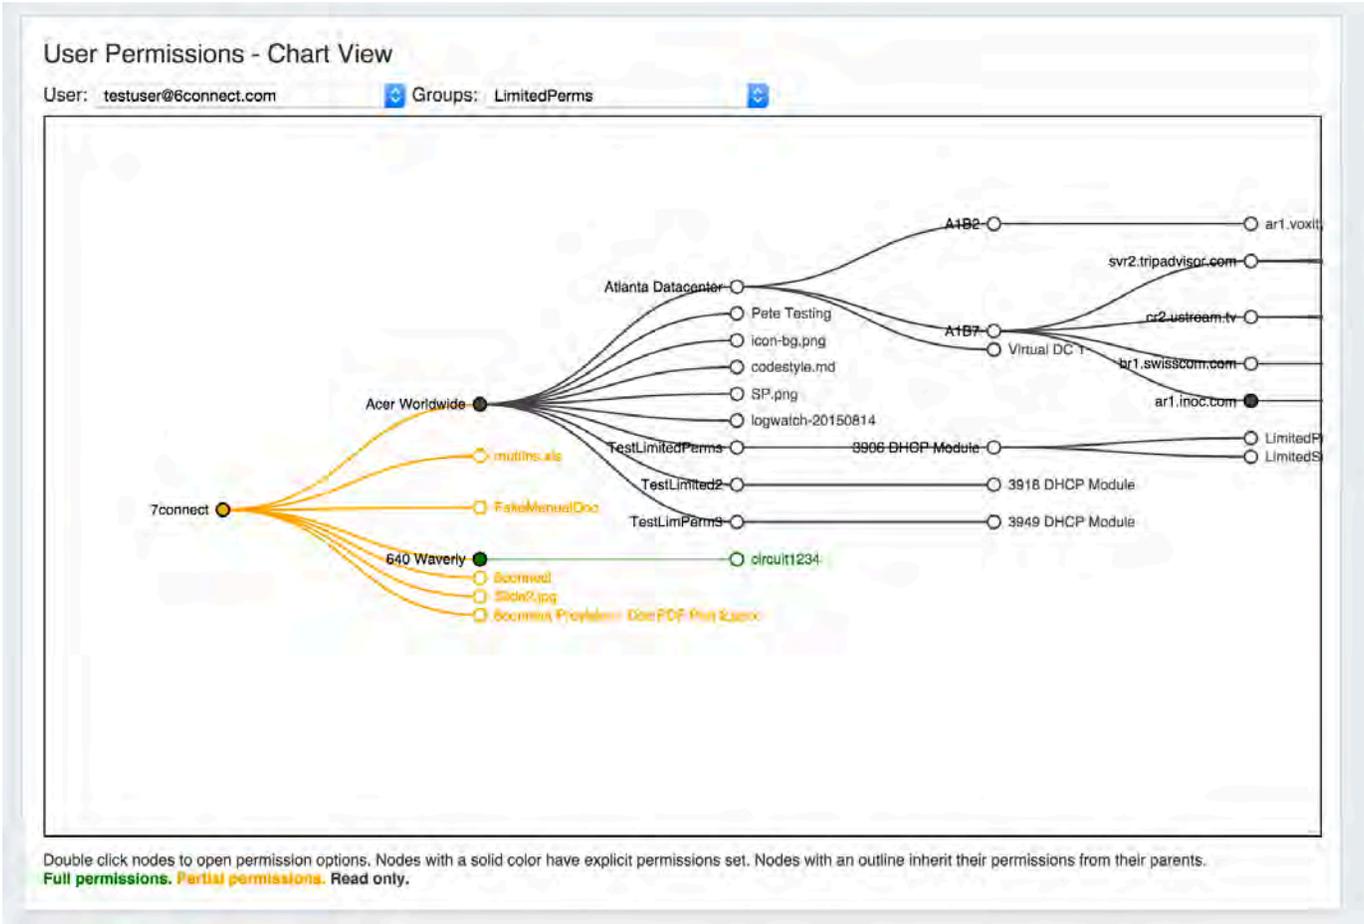

Groups effecting this user on this resource: Global Read-Only
C: Create R: Read U: Uppdate D: Delete

User Permissions Chart

The User Permissions Chart is accessed from the bottom of the [Users](#) tab page. Click "Go to Chart" and the chart page will open.

Users Permissions Chart
[Go to chart](#)

You can graphically view the permissions level of a user by selecting their user name and group from the dropdowns at the top of the chart. The resulting chart will be color coded depending on permissions level.

Single clicking on a filled circle resource node will expand and collapse the node.

Double clicking on a resource will open up the Edit Permissions box, where CRUD permissions may be updated for allowed Resources. Check / Uncheck the desired permissions level, and click save.

Permission Settings

- [Resource Permissions](#)

API Tab

API Tab

The **API** tab allows you to create and manager API keys for users. It also provides links to API documentation and beta [Reverse API](#) management.

To create a key, simply select the user, and click on "Generate Keys". The Name, Username, API Key, Secret Key, and Created date information will be added to the list below.

To revoke a user's key, click "Revoke" at the end of their entry.

For detailed information on working with API features, please refer to [ProVision Developer Tools](#) and [API v1](#).

Add Task

The Scheduler tab allows you to manage and schedule repeating tasks in ProVision.

- Scheduler
 - Available Task Types
 - Add Task
 - Enter Task Details
 - Add Repeat Settings
 - Verify Repeat Settings and Save
 - Managing Tasks
 - Activate / Deactivate Tasks
 - Edit a Task
 - View Task Log
 - Delete a Task

Available Task Types

Six predefined task types are available through the scheduler:

Process Holding Tank - Removes IP Blocks from the Holding Tank and returns them to the available pool.

DNS Zone Transfer - Pushes zone updates to the DNS servers. Select pushes to apply to all zones in a [DNS Group](#), all zones on one server, or one particular zone. Requires the intended Group / Server / Zone to already exist in ProVision.

Backup - Performs a data backup to the 6connect cloud servers, or to a selected resource server existing in ProVision.

IPAM Alerts - Set a time / frequency for IPAM aggregate alert emails to be sent to alert recipients. Alert recipient email and available space threshold percentage is set through the action menu for individual aggregates under the [IPAM Tab](#).

DHCP Server Push - Pushes configuration updates to the selected DHCP server(s). Select push to a single server, or all DHCP servers

Test Task - Tests the scheduler and notification system - it simply sends a notification email to the provided address at the specified run time.

Add Task

To add a new scheduled task, hit the "Add Task" button below the Scheduler task list. You will then see the Task Detail Settings area.

[Add Task](#)

Enter Task Details

Under "Task Detail", fill in the following fields:

Name: Create a name for your task

Task: Select a pre-created task from the dropdown menu.

Process Holding Tank Settings: When selecting the Process Holding Tank task, you will have the following setting options:

Email From / Email To: Enter an email address to send task notifications from, and the desired recipient. This is an optional setting.

DNS Zone Transfer Settings: When selecting the DNS Zone Transfer task, you will have the following setting options:

Select Action Type / Select Server: When selecting the DNS zone transfer task, you can choose the action type to a) push all zones to all servers b) push all zones on a single server (then select server) or c) push one zone (then select zone).

Backup the Database Settings: When selecting the Backup task, you will have the following setting options:

Email From / Email To: Enter an email address to send task notifications from, and the desired recipient. This is an optional setting.

Location: Choose "Cloud" to save the backup to the 6connect cloud, or "Server" to save to a specified server resource already defined in ProVision. If "Server" is selected, choose the server resource from the dropdown list.

Start: The start date you wish the task to begin repeatedly occurring. By default, the current day is entered.

End: The date you wish repeat settings to end. For one-time tasks, enter the next calendar day after the start (run) date.

Add Repeat Settings

Add repeat settings for your tasks. First, select your repeat type - hourly, daily, weekly, monthly, or none (one time). The type that you select will prompt different additional setting options.

Repeat Type options and details:

Hourly: Selecting the hourly repeat type will then prompt for the number of repeat times per hour - every 5,10, 15, 20, 30, or 60 minutes. All minute selections start from the top of the hour. For example, if every 20 minutes is selected, the task will run at :00, :20, :40 during each hour.

Daily: Selecting the daily repeat type will prompt for the specific time to repeat the task, and which days you wish the task to occur. The Repeat Time is based on a 24 hour clock set at UTC time. To assist in any time zone conversions, the current UTC time is shown at the top of the scheduler page.

Weekly: Selecting the weekly repeat type prompts for the specific time to repeat the task as well as frequency by week. Weekly tasks occur on the day selected as the start date. Using the weekly option, you may choose from a range of weekly (every 1 week) to once every two months (every 8 weeks).

Monthly: Selecting the monthly repeat type prompts for a repeat time and a day. For the day option, you can either choose a specific day (ie, the 15th of each month) or a relative day (the 1st Friday of each month).

For Monthly repeat settings, verify that the calendar day you select the task to occur exists! For example, if you select the 5th Saturday of each month, the task will repeat only in months which have 5 Saturdays and skip all other months.

None (one-time): Select the time and day that you wish the single occurrence task to run. (Ensure that "End Date" in task details is set to the day after the desired run date).

After you have selected your Repeat Setting options, click the "Add Repeat Setting" button.

Verify Repeat Settings and Save

When you add repeat settings, they will appear under the "Repeat Settings For This Task" area. Verify your settings, and if desired, you may delete individual repeat settings by hitting the "Delete" button.

When complete, hit the "Save Task" button to finalize your changes and add your new task to the task list.

When do I use RIR Integration and Why?

From [ARIN.net](#):

Organizations that receive space allocations from ARIN, either directly or as a downstream customer, must provide reassignment information back to ARIN. This information must be sent within seven days of the reassignment so that the WHOIS database may be maintained. ARIN also uses utilization history, projected requirements, and other information in order to make future space allocations.

From [RIPE.net](#):

All RIPE assignments and allocations must be registered in the RIPE Database. This is necessary to ensure uniqueness and to support network operations.

Only allocations and assignments registered in the RIPE Database are considered valid. Registration of objects in the database is the final step in making an allocation or assignment. Registration data (range, contact information, status etc.) must be correct at all times (i.e. they have to be maintained). The RIPE community's policies require LIRs to register an inetnum object in the RIPE Database for their own infrastructure and customers' networks. LIRs must ensure registration information is correct and up to date at all times.

What is Simple Re-assign?

From [ARIN.net](#):

Used to subdelegate IP addresses to a customer that does not need to:

- subdelegate the addresses to their own customers
- maintain their own [in-addr.arpa](#) delegation
- display their own point of contact (POC) information.

It can also be used to change the customer name and address information (but not the range) on an existing simple reassignment and to remove simple reassignments. It is submitted by an ARIN Online user account linked to the parent organization's Admin or Tech POC, or the Tech POC for the resource.

Workflow

1) LIR Setup

ProVision supports multiple LIRs (Local Internet Registries) in a single instance. This means that you have the ability to update SWIP/RPSL functions for a given allocation with the LIR information that you wish. LIRs are set up and managed from the IPAM Admin area of ProVision, and thus require Admin level permissions to set up.

While setting up the LIR, the POCs / Contact fields that are filled in will later be used for the RIR Integration.

For detailed step by step instructions, see:

[LIR Management and Use](#)

ARIN LIR Setup and Use

RIPE LIR Setup and Use

2) Assign IP blocks to the ARIN or RIPE RIRs

Assign an IP block to a Resource using the IPAM Gadget or the Assign function from the IPAM Manage screen. See [Working with IP Blocks](#) for additional detail.

3) RIR Integration

Once LIRs have been configured, and blocks assigned under the applicable RIR, you will be able to use the **RIR integration** feature from the Action Menu on the IPAM Manage screen or IPAM Gadget.

Depending on the RIR associated with the block, either an ARIN or RIPE Integration box will pop up.

ARIN / Update SWIP

Select the desired LIR, verify the Net Name / Public Name if desired, and hit "Simple Reassign" or "Cancel".

ARIN Integration: 67.21.0.32/27 (67.21.0.32 - 67.21.0.63)

6connect

Org Handle	Admin POC	Net POC	Abuse POC	Net Name Prefix	API Key
CONN-81	6CONN-ARIN	6CONN-ARIN	6CONN-ARIN	6CONN	*****

Net Name: 6CONN-6C-008-67-21-0-32-27

Registrar Public Name (Simple Reassign only):

By default, when ARIN blocks are SWIPed the customer name in the WHOIS database will be set to the assigned resource name. To override this, enter a public name to use in this field.

Simple Reassign Cancel

For detailed step by step instructions, see:

[ARIN LIR Setup and Use](#)

RIPE / Update RPSL

Identify which LIR data you want to use for the netnum update, and select either "Create Inetnum" or "Cancel" to exit.

RIPE Integration: 192.162.1.0/24 (192.162.1.0 - 192.162.1.255)

RIPE Test LIR

mnt-by	admin-c	tech-c	API Key
MNT-6CONNECT-TEST	SIXC1000-TEST	SIXC1000-TEST	

Create Inetnum Cancel

For detailed step by step instructions, see:

[RIPE LIR Setup and Use](#)

ProVision Developer Tools

Developer Tools

6connect ProVision can integrate with your existing tools and workflow through use of the API and CLI. The 6connect API allows you to access the data and functions of the 6connect web tools to run advanced commands in ProVision, and supports a wide variety of update and deletion conditions not available in the UI.

To use the API, you will need a basic understanding of object oriented programming in PHP and the right tools installed on your system.

1 - Overview

6connect API - Overview

The 6Connect API is a RESTful API to access your data in the 6Connect tools. ReST relies on stateless, client-server communication, and is usually always implemented using the HTTP protocol (the 6Connect API uses HTTPS). It is a simple and lightweight alternative to Web Services and can be implemented in nearly any language. The 6Connect API operates similarly to other popular ReST APIs you may have worked with, such as Facebook or Twitter. You simply create an HTTP GET or POST request according to our standard, send it to the server, and receive data back.

To learn more about request formatting, making requests, and the tools available, visit [Making API Requests](#). You can also get the [PHP SDK](#) for PHP libraries and sample code.

Here are some important details about our ReST implementation:

- The API only comes with the full 6Connect IPAM product. If you would like to upgrade to the full version, contact sales@6Connect.com.
- All transactions are over HTTPS (SSL - port 443) only. Any transaction not using SSL will be rejected, and you will have potentially exposed sensitive data.
- All API results are formatted in JSON. XML support is coming soon.
- All requests are either HTTP GET or POST requests. We suggest using POST if the length of data in the request is over 8KB.
- You can use any language you would like to query the API. We currently have an [SDK for PHP](#). Looking at the sample code would probably help you implement it in any language though.

2 - Making API Requests

6connect API - Making API Requests

API requests can be generated within the web UI by the API Request Generator, or generated programmatically in any language.

An API request looks like this:

<https://cloud.6connect.com/ex/api/v1/api.php?target=ipam&action=get&type=IP&mask=24>

An API response is a JSON-encoded text string, and looks like this:

```
{ "success":1, "message":"1 blocks found",
  "data":[{"id":"7539", "oct1":"1", "oct2":"2", "oct3":"3", "oct4":"0", "mask":"24", "child1":null,
  "is_aggregate":"1", "custid":"holding", "last_updated_time":"2012-03-20
  09:49:00", "description":null, "parent":null, "rir":"ARIN", "notes":"2012-03-20
  09:49:00", "generic_code":null, "region":null, "vlan":null, "arin_net_id":null, "arin_cust_id":
  00:00:00", "assigned_time":"2012-03-20 09:45:12"}]}
```

Instructions on decoding this return data can be found in the API endpoint documentation pages.

Using API Keys:

When using the API without pre-established authentication to ProVision, you must include both your API Key and a specially-prepared query hash parameter, like so:

<https://cloud.6connect.com/ex/api/v1/api.php?target=ipam&action=get&type=IP&mask=24&apiKey=116-MX15LUYY78ZZTW5&hash=8jxj4IApYmgb5IZC>

API Keys can be generated from your ProVision instance by navigating to the Admin panel by using the gear icon in the upper right hand corner, then navigating to the API tab. The API tab will present the API authentication information in the following format:

API Key: 38-TMHQV8CV2XZYC2ZS

Secret Key: 6e04e5822ce90feaa8947ded46c46878

The secret key serves as an API password and is used in the creation of the API Authentication hash. The formula for creating a API query hash from an API query and a Secret Key is the following:

Hash = Base64Encode(Sha256HMACHash (QueryString, SecretKey))

In PHP, this would be performed with the following line of code:

```
$hash = base64_encode(hash_hmac('sha256', $_SERVER['QUERY_STRING'], $secretKey, TRUE));
```

Because the hash function is computed based on the query string, you must calculate a unique hash for every API request!

Example

Lets say you wanted to create a hash for the following API request:

https://cloud.6connect.com/6c_375/api/v1/api.php?target=ipam&action=get&type=IP&mask=24

And that your API Key and Secret Key are as follows:

API Key: 32-5DAYTJQY2TZHOFOB

Secret Key: 48b278ec873bda4738923dbc467f8669

The first step is to append your API Key to the URL. The API Key indicates which user is executing the API query.

https://cloud.6connect.com/6c_375/api/v1/api.php?target=ipam&action=get&type=IP&mask=24&apiKey=32-5DAYTJQY2TZHOFOB

The next step is to isolate the Query String from the request URL. The Query String is everything which follows the question mark. So,

Query String: target=ipam&action=get&type=IP&mask=24&apiKey=32-5DAYTJQY2TZHOFOB

The next step is to calculate the SHA256 hash of this string with your Secret Key. In PHP, this would be:

```
$sha256 = hash_hmac('sha256', "target=ipam&action=get&type=IP&mask=24&apiKey=32-5DAYTJQY2TZHOFOB",  
"48b278ec873bda4738923dbc467f8669", TRUE);
```

As this value has been 256-bit hashed, it will contain many unprintable characters. The solution to this is to encode it in base 64 for transport. Again, in PHP:

```
$hash = base64_encode($sha256);
```

Calculating it out yields the completed hash:

```
$hash = yneSFMyxPpe+3W4IOkVp50K3VStatBcRRak+2ygDUWQ=
```

The calculated hash can then be appended to the full API Query URL to form a completed request:

```
https://cloud.6connect.com/6c\_375/api/v1/api.php?target=ipam&action=get&type=IP&mask=24&apiKey=32-5DAYTJQY2TZHOFOB
```

A Note on False Positives

ProVision utilizes several possible authentication schemes of which key-based API authentication is only one. Session-based, username/password authentication is used for the majority of user interaction with the ProVision front end. Because session information is stored in browsers cookies, a browser can be authenticated to execute API commands as long as the session is active.

Unfortunately, this can lead to confusion when using a machine-based API as the user might use an authenticated browser session to test API-Key based API queries. These queries will always succeed regardless of whether the API Query Hash was calculated correctly as the system defaults to Session-based authentication when it is available.

To ensure that session-based authentication is not polluting your API-Key based testing, always use a separate browser which is not logged in to your ProVision instance to test API queries.

Other Languages

The 6Connect API can be used in just about any scripting or programming language. We have a [PHP SDK](#) that provides example code, and several useful functions for interacting with the API. Even if you don't want to use PHP, the samples will help you create code in other languages.

3 - SDK

6connect API - Getting Started with the SDK

The 6connect API allows you to access to data and functions of the 6connect web tools. The SDK for PHP or Python will help you get this setup quickly by outlining the requirements, prerequisites and provide sample code.

- 6connect API - Getting Started with the SDK
 - SDK for PHP
 - Prerequisites
 - Requirements
 - Install the SDK
 - SDK for Python
 - Install the SDK
 - Need More Information?

SDK for PHP

Prerequisites

The API only comes with a licensed 6connect ProVision application. If you would like access to a ProVision license please contact sales@6connect.com.

Create Your API Credentials

To use the 6connect SDK for PHP, you will need a 6connect API Key and Secret Key.

To create your API Key and Secret Key:

- Log into your 6connect instance (hosted or local)
- Click on the Admin icon, and go into the Administration section.
- Click on the "API" tab.
- Select the user from the drop down you want to enable API access for, and click "Generate Keys".
- The API Key and the Secret Key will now appear directly below that.

*Note that generating a new API will automatically revoke an older API Key.

6connect recommends that each user accessing the API have their own API key configured. However, you can alternatively setup API users by functionality or roles. While the platform is flexible, you should follow your organizations security policies.

Important!

Your Secret Key is a secret! Only you and 6connect should ever know this information. It is important to keep it confidential to protect the privacy of your data. Store it securely and never share this key with other users or place it on other systems. Never include the secret key in requests to 6connect, support requests to 6connect, and never e-mail it to anyone. Do not share it outside your organization. No one who legitimately represents 6connect will ever ask you for your Secret Key.

Requirements

Aside from following the prerequisites, you will need a basic understanding of object oriented programming in PHP and the right tools installed on your system to use the API.

Minimum Requirements

- PHP 5.5 or newer.
- PHP JSON and PCRE extensions (XML will be coming soon).
- Curl PHP extension compiled with OpenSSL libraries. [Click here for more information on curl.](#)

If you aren't sure what is running on your system, you can create a php page on your system and call `phpinfo()` and view this page in a browser, or run `php -i` on the command line.

Install the SDK

Download the file [6connect-PHP-SDKv2.tar.gz](#)

Configure the SDK Security Credentials

- Extract the zipped tar file to a directory.
- Open the `api-config.php` located in the downloaded SDK files.
- Read through the file and place in your instance name (or path for local installs), API Key and Secret Key information as specified.
- Make sure all files are in the same directory (the core class looks for a config file in the same directory by default).
- Run the sample code `api-examples.php`!

Important!

You must setup user API access before running the sample. See the previous section "Create Your API Credentials" for more information.

SDK for Python

In Progress

This section is in progress. More information will be added as we improve and refine our new Python SDK!

Install the SDK

Download the file [6connect-Python-SDK.zip](#)

Configure the SDK Security Credentials

- Extract the zipped tar file to a directory.
- Open the `apiclient.py` located in the downloaded SDK files.
- Read through the file and place in your instance name (or path for local installs), API Key and Secret Key information as specified.
- Make sure all files are in the same directory (the core class looks for a config file in the same directory by default).
- Run the sample code `api-examples.php`!

Important!

You must setup user API access before running the sample. See the previous section "Create Your API Credentials" for more information.

Need More Information?

If you need more general information on the API, try the [API Overview](#).

If you need information on methods available via the API, look at the [API Reference](#).

The SDK also contains a README file with other useful information particular to php.

Authentication Testing

<i>testSSH</i>																								
URL	/api/v1/api.php?target=auth&action=testSSH																							
Description	Returns success or failure of a connection to an external server via SSH.																							
Returns	Examples: <table border="1"><tr><td>SUCCESSFUL</td><td colspan="3">{"success":1,"message":"Success!"}</td></tr><tr><td>ERROR</td><td colspan="3">{'success':0, 'message':'error message'}</td></tr></table>				SUCCESSFUL	{"success":1,"message":"Success!"}			ERROR	{'success':0, 'message':'error message'}														
SUCCESSFUL	{"success":1,"message":"Success!"}																							
ERROR	{'success':0, 'message':'error message'}																							
Required Parameters	<table border="1"><thead><tr><th>Name</th><th>Type</th><th>Example</th><th>Description</th></tr></thead><tbody><tr><td>SSHServer</td><td>STRING</td><td>totally.awesome.com</td><td>IP or FQDN of server.</td></tr><tr><td>SSHPort</td><td>NUMBER</td><td>22</td><td>Port ssh is running on.</td></tr></tbody></table>				Name	Type	Example	Description	SSHServer	STRING	totally.awesome.com	IP or FQDN of server.	SSHPort	NUMBER	22	Port ssh is running on.								
Name	Type	Example	Description																					
SSHServer	STRING	totally.awesome.com	IP or FQDN of server.																					
SSHPort	NUMBER	22	Port ssh is running on.																					
Optional Parameters	<table border="1"><thead><tr><th>Name</th><th>Type</th><th>Example</th><th>Description</th></tr></thead><tbody><tr><td>username</td><td>STRING</td><td>jsmith</td><td>Username on target server.</td></tr><tr><td>password</td><td>STRING</td><td>password123</td><td>Password for user.</td></tr><tr><td>directory</td><td>STRING</td><td>/tmp</td><td>Directory to attempt to access after successful login.</td></tr><tr><td></td><td></td><td></td><td></td></tr></tbody></table>				Name	Type	Example	Description	username	STRING	jsmith	Username on target server.	password	STRING	password123	Password for user.	directory	STRING	/tmp	Directory to attempt to access after successful login.				
Name	Type	Example	Description																					
username	STRING	jsmith	Username on target server.																					
password	STRING	password123	Password for user.																					
directory	STRING	/tmp	Directory to attempt to access after successful login.																					
Example URL	/api/v1/api.php?target=auth&action=testSSH&username=jsmith&password=password123&directory=%2Fvar%2Fnamed%2F6conn																							

<i>testLDAP</i>	
URL	/api/v1/api.php?target=auth&action=testLDAP
Description	Test basic connectivity to an LDAP server. Does not test actual authentication against server.
Returns	Examples: SUCCESSFUL: {'success':1, 'id':'12345'} ERROR: {'success':0, 'message':'unable to add block'}>

Required Parameters	Name	Type	Example	Description
	ldapServer	STRING	ldap.awesome.com	IP or FQDN of the LDAP server.
	ldapPort	NUMBER	389	User-defined block code as defined in Admin-IPAM settings: Generic Code Per Block Name
	ldapMode	STRING	SSL	Options are: SSL, TLS, or None.
Optional Parameters	None			
Example URL	/api/v1/api.php?target=auth&action=testLDAP&ldapPort=389&ldapServer=ldap.awesome.com&ldapMode=None			

testSecure64

URL	/api/v1/api.php?target=auth&action=testSecure64							
Description	Returns success or failure of a connection to an Secure64 DNS appliance.							
Returns	Examples: <table border="1" data-bbox="267 829 829 924"> <tr> <td>SUCCESSFUL</td> <td>{ "success":1, "message":"Success!" }</td> </tr> <tr> <td>ERROR</td> <td>{ 'success':0, 'message':'error message' }</td> </tr> </table>				SUCCESSFUL	{ "success":1, "message":"Success!" }	ERROR	{ 'success':0, 'message':'error message' }
SUCCESSFUL	{ "success":1, "message":"Success!" }							
ERROR	{ 'success':0, 'message':'error message' }							
Required Parameters	Name	Type	Example	Description				
	SSHServer	STRING	totally.awesome.com	IP or FQDN of server.				
	SSHPort	NUMBER	22	Port ssh is running on.				
Optional Parameters	Name	Type	Example	Description				
	username	STRING	jsmith	Username on target server.				
	password	STRING	password123	Password for user.				
	directory	STRING	/tmp	Directory to attempt to access after successful login.				
Example URL	/api/v1/api.php?target=auth&action=testSecure64&username=jsmith&password=password123&directory=%2Fvar%2Fnamed%2F6							

Backup

- Backup
 - backup now

Backup

<i>backup now</i>									
URL	/api/v1/api.php?target=backup&action=now								
Description	Performs a manual backup to the designated location.								
Returns	Examples: SUCCESSFUL: {"success":1,"message":"Backup via curl complete: "} ERROR: {"success":0, "message":"Error Message"}>								
Required Parameters	<table border="1"><thead><tr><th>Name</th><th>Type</th><th>Example</th><th>Description</th></tr></thead><tbody><tr><td>type</td><td>STRING</td><td>curl</td><td>File transfer type. Acceptable values are 'curl' or 'scp'</td></tr></tbody></table>	Name	Type	Example	Description	type	STRING	curl	File transfer type. Acceptable values are 'curl' or 'scp'
Name	Type	Example	Description						
type	STRING	curl	File transfer type. Acceptable values are 'curl' or 'scp'						
Optional Parameters	<table border="1"><thead><tr><th>Name</th><th>Type</th><th>Example</th><th>Description</th></tr></thead><tbody><tr><td>resource</td><td>INTEGER</td><td>2213</td><td>The server resource id to backup to. If left blank, backs up to the 6connect cloud.</td></tr></tbody></table>	Name	Type	Example	Description	resource	INTEGER	2213	The server resource id to backup to. If left blank, backs up to the 6connect cloud.
Name	Type	Example	Description						
resource	INTEGER	2213	The server resource id to backup to. If left blank, backs up to the 6connect cloud.						
Example URL	Backup to designated server: /api/v1/api.php?target=backup&action=now&type=scp&resource_id=2213 Backup to 6connect cloud: /api/v1/api.php?target=backup&action=now&type=curl								

When specifying a backup server resource ID, that server must have the Hostname, Username, and Password fields correctly provided in ProVision.

Log Management

- Log Management
 - Get

Log Management

Get																																									
URL	/api/v1/api.php?target=log&action=get																																								
Description	Returns a list of log entries. Use optional parameters to filter the list.																																								
Returns	<p>Examples:</p> <table border="1"> <tr> <td>SUCCESSFUL</td> <td><code>{"success":1,"message":"Search Successful.", "data":{"logId":"31568","time": "2012-05-07 17:44:43", "logLevel":"INFO","userId":"39","userName": "user@6connect.com","logCategory": "User","message": "User Doe (user@6connect.com) logged in via local authentication", "ip":"107.111.0.228"}}</code></td> </tr> <tr> <td>ERROR</td> <td><code>{'success':0, 'message':'error message'}</code></td> </tr> </table> <p>Data Detail</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>log_id</td> <td>INTEGER</td> <td>24</td> <td>Unique log entry id.</td> </tr> <tr> <td>time</td> <td>DATETIME</td> <td>2012-05-07 22:10:07</td> <td>Date and time year to second.</td> </tr> <tr> <td>log_level</td> <td>STRING</td> <td>NOTICE</td> <td>Standard syslog log levels in verbose format (EMERG, ALERT, CRIT, ERR, WARNING, NOTICE, INFO, DEBUG).</td> </tr> <tr> <td>user_id</td> <td>INTEGER</td> <td>11</td> <td>The unique user id associated with the log entry.</td> </tr> <tr> <td>username</td> <td>STRING</td> <td>user@6connect.com</td> <td>The unique user name associated with the log entry.</td> </tr> <tr> <td>log_category</td> <td>STRING</td> <td>IPAM</td> <td>The 6connect category for the log entry (User, IPAM, Resource Holder, DNS, Peering, Assistant, NTP, Reporting).</td> </tr> <tr> <td>message</td> <td>STRING</td> <td>Created new children from 1.0.0.0/24</td> <td>The detailed log message.</td> </tr> <tr> <td>ip</td> <td>STRING</td> <td>107.111.0.228</td> <td>The remote IP address of the user who took the action being logged.</td> </tr> </tbody> </table>	SUCCESSFUL	<code>{"success":1,"message":"Search Successful.", "data":{"logId":"31568","time": "2012-05-07 17:44:43", "logLevel":"INFO","userId":"39","userName": "user@6connect.com","logCategory": "User","message": "User Doe (user@6connect.com) logged in via local authentication", "ip":"107.111.0.228"}}</code>	ERROR	<code>{'success':0, 'message':'error message'}</code>	Name	Type	Example	Description	log_id	INTEGER	24	Unique log entry id.	time	DATETIME	2012-05-07 22:10:07	Date and time year to second.	log_level	STRING	NOTICE	Standard syslog log levels in verbose format (EMERG, ALERT, CRIT, ERR, WARNING, NOTICE, INFO, DEBUG).	user_id	INTEGER	11	The unique user id associated with the log entry.	username	STRING	user@6connect.com	The unique user name associated with the log entry.	log_category	STRING	IPAM	The 6connect category for the log entry (User, IPAM, Resource Holder, DNS, Peering, Assistant, NTP, Reporting).	message	STRING	Created new children from 1.0.0.0/24	The detailed log message.	ip	STRING	107.111.0.228	The remote IP address of the user who took the action being logged.
SUCCESSFUL	<code>{"success":1,"message":"Search Successful.", "data":{"logId":"31568","time": "2012-05-07 17:44:43", "logLevel":"INFO","userId":"39","userName": "user@6connect.com","logCategory": "User","message": "User Doe (user@6connect.com) logged in via local authentication", "ip":"107.111.0.228"}}</code>																																								
ERROR	<code>{'success':0, 'message':'error message'}</code>																																								
Name	Type	Example	Description																																						
log_id	INTEGER	24	Unique log entry id.																																						
time	DATETIME	2012-05-07 22:10:07	Date and time year to second.																																						
log_level	STRING	NOTICE	Standard syslog log levels in verbose format (EMERG, ALERT, CRIT, ERR, WARNING, NOTICE, INFO, DEBUG).																																						
user_id	INTEGER	11	The unique user id associated with the log entry.																																						
username	STRING	user@6connect.com	The unique user name associated with the log entry.																																						
log_category	STRING	IPAM	The 6connect category for the log entry (User, IPAM, Resource Holder, DNS, Peering, Assistant, NTP, Reporting).																																						
message	STRING	Created new children from 1.0.0.0/24	The detailed log message.																																						
ip	STRING	107.111.0.228	The remote IP address of the user who took the action being logged.																																						
Required Parameters	<div style="border: 1px solid black; padding: 2px; display: inline-block;">None*</div> <p>*There are no required parameters, but at least one optional parameter must be provided for the call to succeed.</p>																																								

Optional Parameters	Name	Type	Example	Description
	block_id	INTEGER	310	Id of the IPAM netblocks to which the logs belong
	get_attributes	BOOLEAN	1	Display the log attributes along with the log into the client's response. (The attributes for each log record). Valid values are 1 (true) and 0 (false).
	log_id	INTEGER	24	Unique log entry id.
	time_min	DATETIME	2015-05-07 [21:00:00]	Retrieve logs starting at this Date and optional time year to second.
	time_max	DATETIME	2015-05-07 [22:00:00]	Retrieve logs ending at this Date and optional time year to second.
	limit	INTEGER	100	Total log entries to retrieve. Default limit is 1000 records.
	orderby	STRING	log_id	Order results by log_id, time, log_level
	order	STRING	ASC	Order by ascending / descending (ASC / DESC).
	offset	INTEGER	50	Offset from 0 to retrieve log entries
	username	STRING	user@6connect.com	The unique user name associated with the log entry.
	log_category	STRING	IPAM	The 6connect category for the log entry (User, IPAM, Resource Holder, DNS, Peering, Assistant, NTP, Reporting).
	log_level	STRING	NOTICE	Standard syslog log levels in verbose format (EMERG, ALERT, CRIT, ERR, WARNING, NOTICE, INFO, DEBUG).
	ip	STRING	1.2.3.4	The remote IP address of the user whose action was logged
	search	STRING	Aggregate Added	Search for a string in the logs. It searches in 'message', 'username', 'time', 'ip' and 'log_category'
time	DATETIME	2015-05-07 [21:00:00]	Search logs from a specific time.	
Example URL	/api/v1/api.php?target=log&action=get&block_id=310&order_by=log_id&order=DESC			

Scheduler 1

This API is in beta and subject to change.

- Scheduler
 - addTask
 - updateTask
 - deleteTask
 - executeTask
 - getTaskHistory
 - getTasks

Scheduler

<i>addTask</i>																																				
URL	/api/v1/api.php?target=scheduler&action=addTask																																			
Description	Add a new scheduled task. Request is POST-only. Params are a single JSON object:																																			
Returns	Examples: SUCCESSFUL: {"success":1,"message":"Message "} ERROR: {"success":0, "message":"Error Message"}>																																			
Required Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>user_id</td> <td>INTEGER</td> <td>100</td> <td>User ID</td> </tr> <tr> <td>name</td> <td>STRING</td> <td>Process Holding Tank</td> <td>Name given to the new</td> </tr> <tr> <td>class_name</td> <td>STRING</td> <td>\scheduler\Tasks\ProcessHoldingTask</td> <td>PHP-namespaced name for the task class. Currently available: \scheduler\Tasks\ProcessHoldingTask \scheduler\Tasks\BackupTask \scheduler\Tasks\DNSPushTask</td> </tr> <tr> <td>data</td> <td></td> <td>{}</td> <td></td> </tr> <tr> <td>active</td> <td>BOOL</td> <td>true</td> <td></td> </tr> <tr> <td>repeat_items</td> <td></td> <td></td> <td></td> </tr> </tbody> </table>				Name	Type	Example	Description	user_id	INTEGER	100	User ID	name	STRING	Process Holding Tank	Name given to the new	class_name	STRING	\scheduler\Tasks\ProcessHoldingTask	PHP-namespaced name for the task class. <i>deleteTask</i>												
URL	/api/v1/api.php?target=scheduler&action=deleteTask											
Description	Delete a scheduler task											
Returns	Examples: SUCCESSFUL: {"success":1,"message":"Task \"New Task\" (2) deleted","data":null} ERROR: {"success":0, "message":"Error Message"}>											
Required Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>taskId</td> <td>INTEGER</td> <td>4</td> <td>ID of the task to delete</td> </tr> </tbody> </table>				Name	Type	Example	Description	taskId	INTEGER	4	ID of the task to delete
Name	Type	Example	Description									
taskId	INTEGER	4	ID of the task to delete									

Optional Parameters	None
Example URL	/api/v1/api.php?target=scheduler&action=deleteTask&taskId=2

<i>executeTask</i>									
URL	/api/v1/api.php?target=scheduler&action=executeTask								
Description	Execute a task immediately								
Returns	Examples: SUCCESSFUL: {"success":1,"message":"Holding tank processed. 0 IPv4 and 0 IPv6 blocks moved to the available pool.", "data":null} ERROR: {"success":0, "message":"Error Message"}>								
Required Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>taskId</td> <td>INTEGER</td> <td>4</td> <td>ID of the task to run</td> </tr> </tbody> </table>	Name	Type	Example	Description	taskId	INTEGER	4	ID of the task to run
Name	Type	Example	Description						
taskId	INTEGER	4	ID of the task to run						
Optional Parameters	None								
Example URL	/api/v1/api.php?target=scheduler&action=executeTask&taskId=1								

<i>getTaskHistory</i>									
URL	/api/v1/api.php?target=scheduler&action=getTaskHistory								
Description	Get history for a specific task								
Returns	Examples: SUCCESSFUL: {"success": 1, "data": [{ "log_id": "1005037", "time": "2015-05-07 12:29:45", "log_level": "6", "user_id": "31", "username": "usernamehere", "log_category": "System", "message": "task_id=1 task=Process Holding Tank action=finished message=Holding tank processed. 0 IPv4 and 0 IPv6 blocks moved to the available pool.", "ip": null }, { "log_id": "1005033", "time": "2015-05-07 12:28:50", "log_level": "6", "user_id": "31", "username": "usernamehere", "log_category": "System", "message": "task_id=1 task=Process Holding Tank action=finished message=Holding tank processed. 1 IPv4 and 0 IPv6 blocks moved to the available pool.", "ip": null }, { "log_id": "1005030", "time": "2015-05-07 12:28:14", "log_level": "6", "user_id": "31", "username": "usernamehere", "log_category": "System", "message": "Task \"Process Holding Tank\" (1) added", "ip": null }] } ERROR: {"success":0, "message":"Error Message"}>								
Required Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>taskId</td> <td>INTEGER</td> <td>1</td> <td>ID of the task to view</td> </tr> </tbody> </table>	Name	Type	Example	Description	taskId	INTEGER	1	ID of the task to view
Name	Type	Example	Description						
taskId	INTEGER	1	ID of the task to view						
Optional Parameters	None								
Example URL	/api/v1/api.php?target=scheduler&action=getTaskHistory&taskId=1								

<i>getTasks</i>	
URL	/api/v1/api.php?target=scheduler&action=getTasks

Description	Gets a list of scheduled tasks and their repeat settings
Returns	<p>Examples:</p> <p>SUCCESSFUL: { "success": 1, "data": [{ "id": "1", "user_id": "31", "name": "Process Holding Tank", "class_name": "\\scheduler\\Tasks\\ProcessHoldingTask", "active": true, "data": null, "last_run": "2015-05-07 12:29:45", "repeat_items": [{ "id": "1", "task_id": "1", "repeat_start": "2015-05-06", "repeat_end": null, "repeat_interval": null, "repeat_year": "**", "repeat_month": "**", "repeat_day": "**", "repeat_week": "**", "repeat_weekday": "4", "repeat_hour": "20", "repeat_minute": "0" }, { "id": "2", "task_id": "1", "repeat_start": "2015-05-06", "repeat_end": null, "repeat_interval": null, "repeat_year": "**", "repeat_month": "**", "repeat_day": "**", "repeat_week": "**", "repeat_weekday": "5", "repeat_hour": "20", "repeat_minute": "0" }, { "id": "3", "task_id": "1", "repeat_start": "2015-05-06", "repeat_end": null, "repeat_interval": null, "repeat_year": "**", "repeat_month": "**", "repeat_day": "**", "repeat_week": "**", "repeat_weekday": "6", "repeat_hour": "20", "repeat_minute": "0" }, { "id": "4", "task_id": "1", "repeat_start": "2015-05-06", "repeat_end": null, "repeat_interval": null, "repeat_year": "**", "repeat_month": "**", "repeat_day": "**", "repeat_week": "**", "repeat_weekday": "0", "repeat_hour": "20", "repeat_minute": "0" }] }, { "id": "2", "user_id": "31", "name": "New Task", "class_name": "\\scheduler\\Tasks\\TestTask", "active": true, "data": null, "last_run": "2015-05-07 12:35:41", "repeat_items": [{ "id": "5", "task_id": "2", "repeat_start": "2015-05-06", "repeat_end": null, "repeat_interval": null, "repeat_year": "**", "repeat_month": "**", "repeat_day": "**", "repeat_week": "**", "repeat_weekday": "1", "repeat_hour": "21", "repeat_minute": "0" }, { "id": "6", "task_id": "2", "repeat_start": "2015-05-06", "repeat_end": null, "repeat_interval": null, "repeat_year": "**", "repeat_month": "**", "repeat_day": "**", "repeat_week": "**", "repeat_weekday": "2", "repeat_hour": "21", "repeat_minute": "0" }, { "id": "7", "task_id": "2", "repeat_start": "2015-05-06", "repeat_end": null, "repeat_interval": null, "repeat_year": "**", "repeat_month": "**", "repeat_day": "**", "repeat_week": "**", "repeat_weekday": "3", "repeat_hour": "21", "repeat_minute": "0" }, { "id": "8", "task_id": "2", "repeat_start": "2015-05-06", "repeat_end": null, "repeat_interval": null, "repeat_year": "**", "repeat_month": "**", "repeat_day": "**", "repeat_week": "**", "repeat_weekday": "4", "repeat_hour": "21", "repeat_minute": "0" }, { "id": "9", "task_id": "2", "repeat_start": "2015-05-06", "repeat_end": null, "repeat_interval": null, "repeat_year": "**", "repeat_month": "**", "repeat_day": "**", "repeat_week": "**", "repeat_weekday": "5", "repeat_hour": "21", "repeat_minute": "0" }] }] }</p> <p>ERROR: { "success": 0, "message": "Error Message" }></p>
Required Parameters	None
Optional Parameters	None

Zone Templates

- Zone Templates
 - Get
 - Update
 - Delete

Zone Templates

Get													
URL	/api/v1/api.php?target=zoneTemplate&action=get												
Description	Returns success or failure of a connection to an external server via SSH.												
Returns	<p>Examples:</p> <table border="1"> <tr> <td>SUCCESSFUL</td> <td>{ "success":1,"message":"Found 1 records for template \"Awesome Template\".", "data":{"templateId":"1011","name":"14:01:24","userId":"112","soa":null,"refresh":"14400","retry":"3600","expire":"604800","minimum":null,"ttl":null,"use"</td> </tr> <tr> <td>ERROR</td> <td>{ 'success':0, 'message':'error message' }</td> </tr> </table>	SUCCESSFUL	{ "success":1,"message":"Found 1 records for template \"Awesome Template\".", "data":{"templateId":"1011","name":"14:01:24","userId":"112","soa":null,"refresh":"14400","retry":"3600","expire":"604800","minimum":null,"ttl":null,"use"	ERROR	{ 'success':0, 'message':'error message' }								
SUCCESSFUL	{ "success":1,"message":"Found 1 records for template \"Awesome Template\".", "data":{"templateId":"1011","name":"14:01:24","userId":"112","soa":null,"refresh":"14400","retry":"3600","expire":"604800","minimum":null,"ttl":null,"use"												
ERROR	{ 'success':0, 'message':'error message' }												
Required Parameters	None												
Optional Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>templateId</td> <td>NUMBER</td> <td>3</td> <td>ID of the specific template to get.</td> </tr> <tr> <td></td> <td></td> <td></td> <td></td> </tr> </tbody> </table>	Name	Type	Example	Description	templateId	NUMBER	3	ID of the specific template to get.				
Name	Type	Example	Description										
templateId	NUMBER	3	ID of the specific template to get.										
Example URL	/api/v1/api.php?target=zoneTemplate&action=get												

Update													
URL	/api/v1/api.php?target=zoneTemplate&action=update												
Description	Create a new template or update an existing template.												
Returns	<p>Examples:</p> <p>SUCCESSFUL: { "success":1,"message":"Template updated", "data":{"templateId":"1011","name":"Awesome Template","created":"2013-08-05 23:15:52","modified":"2013-08-05 23:15:52","userId":"112","soa":"ns1.test.net hostmaster.ns1.test.net","refresh":"14400","retry":"3600","expire":"604800","minimum":null,"ttl":false,"userName":"anna@6connect.c</p> <p>ERROR: { 'success':0, 'message':'Error updating template: error details' }></p>												
Required Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>name</td> <td>STRING</td> <td>Test Template</td> <td>The name of the template to be created or updated.</td> </tr> <tr> <td></td> <td></td> <td></td> <td></td> </tr> </tbody> </table>	Name	Type	Example	Description	name	STRING	Test Template	The name of the template to be created or updated.				
Name	Type	Example	Description										
name	STRING	Test Template	The name of the template to be created or updated.										

Optional Parameters	Name	Type	Example	Description
	soa	STRING	ns1.test.net hostmaster.ns1.test.net	A valid SOA for the template in for format
	ttl	INTEGER	86400	The TTL for the zone template, which is the default expiration time for all r TTL.
	refresh	INTEGER	14400	The time period for slaves to refresh the zone.
	retry	INTEGER	3600	Time that a slave should retry refreshing the zone in case of incident.
	expire	INTEGER	604800	Time for a slave to expire a zone.
	mininum	INTEGER	3600	The maximum caching time in the event of failed lookups.
	count_records	INTEGER	5	Number of host records submitted with the update. All the following param followed with their position in the count. In this example, the first record wo for the first record followed by _1, the second record _2, and so on. This wi the template follow.
	host_1	STRING		The DNS record value.
	ttl_1	INTEGER	3600	TTL of the specific host record.
	type_1	STRING	A	A valid DNS record type.
	value_1	IP	1.2.3.4	A valid IPv4 or IPv6 address.
Example URL	api/v1/api.php?target=zoneTemplate&action=update&templateId=1011&count_records=1&name=Awesome+Template&soa=ns1.te &refresh=14400&retry=3600&expire=604800&minimum=3600&value_0=undefined+undefined&host_1=www&ttl_1=3600&type_1=			

Delete									
URL	/api/v1/api.php?target=zoneTemplate&action=delete								
Description	Deletes a DNS template.								
Returns	<p>Examples:</p> <table border="1"> <tr> <td>SUCCESSFUL</td> <td>{"success":1,"message":"Template \"Test Template\" delete."}</td> </tr> <tr> <td>ERROR</td> <td>{"success":0,"message":"No template found for templateId \"1005\"."}</td> </tr> </table>	SUCCESSFUL	{"success":1,"message":"Template \"Test Template\" delete."}	ERROR	{"success":0,"message":"No template found for templateId \"1005\"."}				
SUCCESSFUL	{"success":1,"message":"Template \"Test Template\" delete."}								
ERROR	{"success":0,"message":"No template found for templateId \"1005\"."}								
Required Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>templateId</td> <td>INTEGER</td> <td>3</td> <td>ID of the template to delete.</td> </tr> </tbody> </table>	Name	Type	Example	Description	templateId	INTEGER	3	ID of the template to delete.
Name	Type	Example	Description						
templateId	INTEGER	3	ID of the template to delete.						
Optional Parameters	None.								
Example URL	/api/v1/api.php?target=zoneTemplate&action=delete&templateId=1005								

API Module - DHCP

DHCP Management Version 2

- DHCP Management Version 2
 - Overview
 - API Updates
 - DHCP API How-To
 - Relate with Resources
 - Create DHCP IP Aggregates
 - Subnets and Hosts
 - Linking Subnets and Hosts with DHCP Servers
 - Pushing Configurations
 - Detailed API Specification

Overview

DHCP Management Version 2 integrates DHCP management with ProVision's resource and permissions hierarchy, as well as the IP Management system. Individual DHCP servers can be assigned via [Resource Permissions](#) to different internal [user groups](#), to be managed by only the appropriate parties.

Under DHCPv2 there is no distinct “DHCP Server” type or section – instead there is a “DHCP Module” which, when attached as a child to an existing resource, transforms it into a DHCP-enabled device. The most common use is to take the generic “Server” Section and turn it into a DHCP Server by attaching the DHCP Module as a child. This configuration allows users to add functionality to a basic resource and provides a cleaner management interface.

API Updates

The DHCPv1 API operated via calls to the DHCPv1Server and the DHCPv1Entry endpoint families. However, now that DHCPv2 is contained entirely within the resource system, most of the API calls to manipulate DHCP data do so using the Resource family of API endpoints to modify specific Resource attributes reserved for DHCP functionality.

DHCP API How-To

Relate with Resources

The DHCPv2 system builds upon the ProVision [Resource API](#). With the exception of a [few configuration commands](#) all DHCPv2 API commands use the Resource family of API endpoints.

▼ [How to attach the DHCP Module as a child](#)

As described above, DHCPv2 functionality is enabled on a particular resource by attaching a DHCP Module as a child. A command to do this is as follows:

```
[ProVision root]/api/v1/api.php?target=resource&action=add

data:
meta[type]: dhcp_module
meta[name]: [parent resource id] DHCP Module
meta[parent_id]: [parent resource id]
```

The special resource type “dhcp_module” indicates to ProVision that the DHCP system is enabled for the parent object. The attributes associated with the “dhcp_module” resource govern the DHCP system's behavior.

Updating the attributes of a DHCP Server uses a Resource Update command:

```
[ProVision root]/api/v1/api.php?target=resource&action=update&meta[id]=2178
&meta[type]=dhcp_module&fields[_dhcp_attributes][]={"type":"ISC","notes":"notes go
here","username":"username","port":"port","config_test":"/etc/init.d/dhcpd
configtest","server_stop":"/etc/init.d/dhcpd stop","server_start":"/etc/init.d/dhcpd
start","config_path":"/tmp/dhcpd.conf","option_routers":"192.168.0.0","option_domain_na
line 1","freeLine2":"free line 2","freeLine3":"free line 3"}
```

This command appears rather complicated, but can be broken apart into reasonable pieces. The first section:

```
target=resource&action=update&meta[id]=2178&meta[type]=dhcp_module
```

is familiar from other parts of ProVision. We are updating a resource of type "dhcp_module" whose resource id is 2178. The second section of the command details the update values, starting with

```
fields[_dhcp_attributes][]=
```

which contains a JSON-encoded string of all the fields specific to a DHCP server's function. When expanded into its full object form it is substantially easier to digest:

```
{
    "type":"ISC",
    "notes":"notes go here",
    "username":"username",
    "port":"port",
    "config_test":"/etc/init.d/dhcpd configtest",
    "server_stop":"/etc/init.d/dhcpd stop",
    "server_start":"/etc/init.d/dhcpd start",
    "config_path":"/tmp/dhcpd.conf",
    "option_routers":"192.168.0.0",
    "option_domain_name_servers":"ns1.6connect.com",
    "option_domain_name":"6connect.com",
    "authoritative":"1",
    "default_lease_time":"600",
    "max_lease_time":"7200",
    "local_port":"67",
    "log_facility":"local7",
    "password":"password",
    "server_ip":"192.168.0.1",
    "freeLines":3,
    "freeLine1":"free line 1",
    "freeLine2":"free line 2",
    "freeLine3":"free line 3"
}
```

This object describes all the most common DHCP server configuration options. For a full explanation of each of the fields, see the Detailed API Specification later in this document.

Please note that the object above must be passed to the DHCP system as a JSON-encoded string. It must be passed into the special

“_dhcp_attributes” attribute for it to be functional, as in the example URL.

Create DHCP IP Aggregates

For details on how to manage IP aggregates using ProVision's IPAM API, see [API Module - IPAM](#).

Of particular interest to DHCP management is the addition of DHCP aggregates, which are sections of IP space marked as available for use by the DHCPv2 system.

▼ How to add a DHCP Aggregate

An example command to add a DHCP Aggregate is:

```
[ProVision root]/api/v1/api.php?target=ipam&action=add&block=192.168.0.0/24&rir=1918&vlan=&tags=&region=&resourceId=1282&allowSubAssignments=true
```

The important part to note is that the IP block is being assigned to resourceid 1282, which corresponds to the DHCP Available resource. The DHCP Available resource is a system-level resource which is used to hold all unassigned DHCP IP addresses. Every instance has its own DHCP Available resource, whose id can be found with the following command:

```
[ProVision root]/api/v1/api.php?target=resource&action=get&slug=dhcp-available
```

New DHCP subnets and hosts draw their IPs from this pool. If there are no IPs in the DHCP Available pool new subnets and hosts will not be able to be created.

DHCP IP aggregates are fetched, updated, split, and deleted using the standard IPAM management API endpoints. Please see the [IPAM API Documentation](#) for details.

Subnets and Hosts

Every DHCP configuration file consists primarily of Subnet and Host declarations, mapping out what IP addresses are available for what purpose. In DHCPv2, DHCP Pools are reusable components that can be attached to several DHCP Servers in order to build flexible, responsive DHCP configurations.

In ProVision DHCPv2 all DHCP Pools regardless of whether they span Subnets or individual Hosts require that a “dhcp_pool” resource be created to govern them.

▼ How to create DHCP Pools

Similar to how the “dhcp_module” resource was created above, the command to create a DHCP Pool is as follows:

```
[ProVision root]/api/v1/api.php?target=resource&action=add&meta[type]=dhcp_pool
&meta[name]=New
Subnet&fields[_dhcp_type][]=subnet&fields[_dhcp_pool_attributes][]={ "mac": "", "rangeStar
Line 1", "freeLine2": "Free Line 2", "freeLine3": "Free Line 3" }
```

The first half of this command is relatively straightforward:

```
target=resource&action=add&meta[type]=dhcp_pool&meta[name]=New Subnet
```

This section informs the API that we wish to create a new, empty “dhcp_pool” resource whose name is “New Subnet.”

```
fields[_dhcp_type][]=subnet&fields[_dhcp_pool_attributes][]={"mac":"","rangeStart":"","rangeEnd":"","freeLines":3,"freeLine1":"Free Line 1","freeLine2":"Free Line 2","freeLine3":"Free Line 3"}
```

The second half of the command behaves in a similar manner to the “dhcp_module.” The “_dhcp_pool_attributes” field holds a JSON-encoded string which describes the dhcp_pool resource. When expanded, the JSON string becomes the following object:

```
{
  "mac": "",
  "rangeStart": "",
  "rangeEnd": "",
  "freeLines": 3,
  "freeLine1": "Free Line 1",
  "freeLine2": "Free Line 2",
  "freeLine3": "Free Line 3"
}
```

For a full explanation of each of the fields, see the [Detailed API Specification](#).

Please note that the object above must be passed to the DHCP system as a JSON-encoded string. It must be passed into the “_dhcp_pool_attributes” attribute for it to be functional, as in the example URL.

Once a dhcp_pool resource is in the system it can be updated with IP data obtained from the IP Management system. Under DHCPv2, the DHCP system uses all the standard IPAM API endpoints and can make use of both the smartAssign and the directAssign methods. Please see the [IPAM API documentation](#) for details.

▼ [How to smart-assign a DHCP IP range from the DHCP Available resource to a dhcp_pool resource](#)

An example command for smart-assigning a DHCP IP range from the DHCP Available resource to a newly-created dhcp_pool resource is as follows:

```
[ProVision root]/api/v1/api.php?target=ipam&action=smartAssign&resourceId=2180&type=ipv4&mask=31&rir=1918&assignedResourceId=1282
```

In this example we are using the IPAM API endpoint to smart-assign an IPv4 /31 from the DHCP Available resource (resource id 1282) to the newly-created dhcp_pool object (resource id 2180). This action removes this IP range from the available pool and prevents it from being used by other parts of ProVision.

Once an IP block is assigned to a dhcp_pool it should be updated with the proper range start and range end. A Resource Update command is used for this.

```
[ProVision root]/api/v1/api.php?target=resource&action=update&meta[type]=dhcp_pool&meta[name]=AnotherTest&fields[_dhcp_type][]=subnet&fields[_dhcp_pool_attributes][]={"mac":"","rangeStart"
```

The key information here is that the “rangeStart” and the “rangeEnd” fields in the JSON-encoded ‘_dhcp_pool_attributes’ attribute have been populated with the beginning and end of the IP range assigned by smart-assign. Also note that a new field is being populated as ‘_dhcp_ip_id’, which contains the IPAM id of the newly-assigned IP block.

When assigning dhcp_pools covering a single host the steps are much the same, but the ‘mac’ field in the ‘_dhcp_pool_attributes’ object must be populated with the MAC address of the host in question.

Linking Subnets and Hosts with DHCP Servers

DHCP Pools exist as re-usable components which can be individually assigned to any number of DHCP Servers in order to assemble flexible DHCP Configurations. Once created, a DHCP Pool is not attached to any DHCP Server in the system. DHCP Pools must be linked to a server for the pool to be included in DHCP configuration pushes.

▼ How to link a dhcp_pool and a DHCP Server

An example of building a link between a dhcp_pool and a DHCP Server is:

```
[ProVision root]/api/v1/api.php?target=resource&action=addLink&resource_id1=2178&resource_id2=1452&relation=dhcpPoolLink
```

The Resource Linkage system controls which DHCP Pools are associated with a given DHCP Server. In the case of linking a DHCP Pool to a DHCP Server, the relation used is "dhcpPoolLink". This is a directional link, so it is important that resource_id1 and resource_id2 do not get confused.

```
relation: "dhcpPoolLink"
resource_id1: the id of the dhcp_module this pool is being linked to
resource_id2: the id of the dhcp_pool being linked
```

It is very important that resource_id1 not be confused with resource_id2. The link will not function with the values reversed.

To undo the above and break a DHCP Pool link, use the same command but substitute "deleteLink" for the action "addLink".

```
[ProVision root]/api/v1/api.php?target=resource&action=deleteLink&resource_id1=2178&resource_id2=2179&relation=dhcpPoolLink
```

Pushing Configurations

Pushing configuration files and restarting a DHCP server is a fairly straightforward process.

▼ How to push configuration files

Once the server has been configured according to the previous sections, hitting the following API endpoint will trigger a DHCP push:

```
[ProVision root]/api/v1/api.php?target=dhcp&action=push&id=2178
```

The "id" in the above string is the id of the dhcp_module resource attached to the server you whose configuration is to be pushed. The API return payload will contain success or failure codes, as well as a description of any errors which might have occurred.

When a DHCP configuration file is pushed an SSH connection is opened to the configured server using the user, password, and port supplied to the '_dhcp_attributes' attribute on the dhcp_module resource. If the system successfully connects, it will assemble a DHCP configuration from the information given to the dhcp_module's '_dhcp_attribute' attribute and then parse and add in all linked dhcp_pool resources.

After the assembled file has been transferred to the DHCP server it will be placed in the location given by 'config_path' on the dhcp_module, and then the command described in 'config_test' will be run to determine whether or not this new file parses correctly. If 'config_test' is blank or omitted, this step is skipped.

If the file parses correctly the DHCP will be stopped and restarted according to the 'server_stop' and 'server_start' commands on the DHCP module. If there are errors at any point the system backs out, replaces old config files, and reports the errors via the 'message' return field of the API call.

Detailed API Specification

A detailed listing of API endpoints related to DHCP Servers, Pools, and Links can be found here:

- [API Module - DHCPv2](#)

API Module - DHCPv2

- DHCPv2 Module
 - get all DHCP-enabled resources
 - create a new DHCP-enabled resource
 - update a DHCP-enabled resource with new configuration info
 - remove DHCP functionality from a resource
 - get all DHCP Pools
 - create a new DHCP Pool resource
 - update a DHCP Pool
 - delete a DHCP Pool
 - assigning an IP address or blocks to a DHCP Pool
 - get all DHCP Pool linkages
 - add a new DHCP Pool linkage
 - delete DHCP Pool linkages
 - push a DHCP config
 - DHCP search
- Data Attributes
 - `_dhcp_attributes`
 - `_dhcp_pool_attributes`

DHCPv2 Module

The DHCPv2 system is built upon the Resource API, so actions relating to DHCP tasks are largely expressed in terms of Resource actions.

This section describes common DHCP tasks and how they are accomplished via the DHCPv2 system.

get all DHCP-enabled resources

Description	Finds all resources from section 'dhcp_module,' which indicates that their parents are DHCP-enabled. Adding in other Resource-Get API parameters can filter this list further.
URL	<code>/api/v1/api.php?target=resource&action=get&type=dhcp_module</code>

Returns	<p>Examples:</p> <table border="1"> <tr> <td>SUCCESSFUL:</td> <td><pre>{ "success":1, "message":"Search successful", "data":{"id":"1432", "name":"1392 DHCP Module", "slug":"1392-dhcp-module", "type":"dhcp_module", "parent_id":"1392", "category_id":null, "attr":{"_dhcp_attributes":{"type":"ISC", "notes":"","username":"","port":"","config_test":"","VetcVinit.dVdhcpd configtest", "server_stop":"","VetcVinit.dVdhcpd stop", "server_start":"","VetcVinit.dVdhcpd start", "config_path":"","option_routers":"","option_domain_name_servers":"","option_domain_name":"","authoritative":"","1", "default_lease_time":"","600", "max_lease_time":"","7200", "local_port":"","67", "log_facility":"","local7", "password":"","", "server_ip":"","10.0.0.0", "freeLines":0}, "_dhcp_config_id":"33"}}, "result_count":1, "found_count":1}</pre></td> </tr> <tr> <td>ERROR:</td> <td><pre>{ "success":0, "message":"error message"}</pre></td> </tr> </table> <p>Return Detail:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>id</td> <td>INTEGER</td> <td>ID of the dhcp_module resource</td> </tr> <tr> <td>name</td> <td>STRING</td> <td>The name of the dhcp_module</td> </tr> <tr> <td>slug</td> <td>STRING</td> <td>The unique reference string for this resource</td> </tr> <tr> <td>type</td> <td>STRING</td> <td>Always 'dhcp_module'</td> </tr> <tr> <td>parent_id</td> <td>INTEGER</td> <td>The resource to which the dhcp_module is attached</td> </tr> <tr> <td>category_id</td> <td>INTEGER</td> <td>The category to which this dhcp_module is associated</td> </tr> <tr> <td>result_count</td> <td>INTEGER</td> <td>How many dhcp_modules are returned in this search.</td> </tr> <tr> <td>found_count</td> <td>INTEGER</td> <td>How many dhcp_modules were found in this query, without pagination.</td> </tr> </tbody> </table> <p>Attributes:</p> <table border="1"> <thead> <tr> <th>Key</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>_dhcp_attributes</td> <td>JSON</td> <td>A JSON-encoded string containing all the specific configuration parameters which govern this DHCP server. remove DHCP functionality from a resource

Description To remove DHCP functionality, delete the dhcp_module child resource. This operation uses general Resource->Delete functionality.

URL /api/v1/api.php?target=resource&action=delete&id=2166

Returns **Examples:**

SUCCESSFUL:	{"success":1,"message":"Deleted 2163-dhcp-module-3 (#2166)"}
ERROR:	{"success":0, "message":"error message"}

get all DHCP Pools

Description As with the dhcp_module commands, the API endpoints governing DHCP IP Pools use the general Resource system. All the modifi

URL /api/v1/api.php?target=resource&action=get&type=dhcp_pool

Returns **Examples:**

SUCCESSFUL:	{"success":1,"message":"Search successful","data":[{"id":"1482","name":"Blah","slug":"blah","type":"dhcp_pool","parent_id":"1","category_id":null,"result_count":1,"found_count":1}]}
ERROR:	{"success":0, "message":"error message"}

Return Detail:

Name	Type	Description
id	INTEGER	ID of the dhcp_pool resource
name	STRING	The name of the dhcp_pool
slug	STRING	The unique reference string for this resource
type	STRING	Always 'dhcp_pool'
parent_id	INTEGER	The resource to which the dhcp_pool is attached
category_id	INTEGER	The category to which this dhcp_pool is associated
result_count	INTEGER	How many dhcp_pools are returned in this search.
found_count	INTEGER	How many dhcp_pools were found in this query, without pagination.

Attributes:

Key	Type	Description
_dhcp_type	STRING	Either 'subnet' or 'host'. Determines whether this DHCP Pool is describing a Subnet or a Hos
_dhcp_pool_attributes	JSON	A JSON-encoded string containing all the specific configuration parameters which govern this
_dhcp_ip_id	INTEGER	The id of the IPAM subnet or host which is assigned to this DHCP Pool

create a new DHCP Pool resource

Description	Uses the general Resource-Add endpoint to create a DHCP Pool resource.																									
URL	<code>/api/v1/api.php?target=resource& action=add& meta[type]=dhcp_pool& meta[name]=New Subnet& fields[_dhcp_type][]=host& fields[_dhcp_pool_attributes][]={"mac":"aa:bb:cc:dd:ee:ff", "rangeStart":"","rangeEnd":"","freeLines":3, "freeLine1":"Free Line 1", "freeLine2":"Free Line 2", "freeLine3":"Free Line 3"}</code>																									
Returns	<p>Examples:</p> <table border="1"><tr><td>SUCCESSFUL:</td><td><code>{"success":1,"message":"Resource added","data":{"id":2167,"name":"New Subnet","slug":"new-subnet","type":"dhcp_pool ","parent_id":1,"category_id":null,"attr":[]}}</code></td></tr><tr><td>ERROR:</td><td><code>{"success":0, "message":"error message"}</code></td></tr></table> <p>Return Detail:</p> <table border="1"><thead><tr><th>Name</th><th>Type</th><th>Description</th></tr></thead><tbody><tr><td>id</td><td>INTEGER</td><td>ID of the newly created dhcp_pool</td></tr><tr><td>name</td><td>STRING</td><td>The name of the dhcp_pool</td></tr><tr><td>slug</td><td>STRING</td><td>The unique reference string for this resource</td></tr><tr><td>type</td><td>STRING</td><td>Always 'dhcp_pool'</td></tr><tr><td>parent_id</td><td>INTEGER</td><td>The parent resource; by default the TLR.</td></tr><tr><td>category_id</td><td>INTEGER</td><td>The category to which this dhcp_pool is associated</td></tr></tbody></table>	SUCCESSFUL:	<code>{"success":1,"message":"Resource added","data":{"id":2167,"name":"New Subnet","slug":"new-subnet","type":"dhcp_pool ","parent_id":1,"category_id":null,"attr":[]}}</code>	ERROR:	<code>{"success":0, "message":"error message"}</code>	Name	Type	Description	id	INTEGER	ID of the newly created dhcp_pool	name	STRING	The name of the dhcp_pool	slug	STRING	The unique reference string for this resource	type	STRING	Always 'dhcp_pool'	parent_id	INTEGER	The parent resource; by default the TLR.	category_id	INTEGER	The category to which this dhcp_pool is associated
SUCCESSFUL:	<code>{"success":1,"message":"Resource added","data":{"id":2167,"name":"New Subnet","slug":"new-subnet","type":"dhcp_pool ","parent_id":1,"category_id":null,"attr":[]}}</code>																									
ERROR:	<code>{"success":0, "message":"error message"}</code>																									
Name	Type	Description																								
id	INTEGER	ID of the newly created dhcp_pool																								
name	STRING	The name of the dhcp_pool																								
slug	STRING	The unique reference string for this resource																								
type	STRING	Always 'dhcp_pool'																								
parent_id	INTEGER	The parent resource; by default the TLR.																								
category_id	INTEGER	The category to which this dhcp_pool is associated																								

update a DHCP Pool

Description	Modifying an existing dhcp_pool uses the identical commands as all other Resource-Update actions.
URL	<code>/api/v1/api.php?target=resource& action=update& meta[type]=dhcp_pool& meta[name]=Another Test& fields[_dhcp_type][]=subnet& fields[_dhcp_pool_attributes][]={"mac":"","rangeStart":"10.10.10.4", "rangeEnd":"10.10.10.5", "freeLines":3, "freeLine1":"example1", "freeLine2":"example2", "freeLine3":"example3"}&fields[_dhcp_ip_id][]=92430&meta[id]=2165</code>

Returns	<p>Examples:</p> <table border="1"> <tr> <td>SUCCESSFUL:</td> <td><pre>{ "success":1, "message":"Resource Updated", "data":{"id":"2165", "name":"Another Test", "slug":"2163-dhcp-module-2", "type":"dhcp_module", "parent_id":"2163", "category_id":null,"attr":{"_dhcp_type":"subnet", "_dhcp_pool_attributes":{"mac":"","rangeStart":"10.10.10.4", "rangeEnd":"10.10.10.5", "freeLines":3, "freeLine1":"example1", "freeLine2":"example2", "freeLine3":"example3"}, "_dhcp_ip_id":"92430"}}}</pre></td> </tr> <tr> <td>ERROR:</td> <td><pre>{"success":0, "message":"error message"}</pre></td> </tr> </table> <p>Return Detail:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>id</td> <td>INTEGER</td> <td>ID of the newly created dhcp_module</td> </tr> <tr> <td>name</td> <td>STRING</td> <td>The name of the dhcp_module</td> </tr> <tr> <td>slug</td> <td>STRING</td> <td>The unique reference string for this resource</td> </tr> <tr> <td>type</td> <td>STRING</td> <td>Always 'dhcp_module'</td> </tr> <tr> <td>parent_id</td> <td>INTEGER</td> <td>The resource to which the dhcp_module is attached</td> </tr> <tr> <td>category_id</td> <td>INTEGER</td> <td>The category to which this dhcp_module is associated</td> </tr> </tbody> </table> <p>Attributes:</p> <table border="1"> <thead> <tr> <th>Key</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>_dhcp_type</td> <td>STRING</td> <td>Either 'subnet' or 'host'. get all DHCP Pool linkages

Description	The association between DHCP Pools and DHCP Modules belongs to the Resource Linkage family of endpoints. The 'relation' field should be set to the 'dhcpPoolLink' type to pull only DHCP Pool linkage information.																												
URL	/api/v1/api.php?target=resource&action=getLink&relation=dhcpPoolLink																												
Returns	<p>Examples:</p> <table border="1"> <tr> <td>SUCCESSFUL:</td> <td>{ "success":1, "message":"Search successful", "data":{"meta":{"totalRecords":3, "retrieved":3}, "0":{"id":22, "resource_id1":1292, "resource_id2":1302, "relation":"dhcpPoolLink"}, "1":{"id":2, "resource_id1":1292, "resource_id2":1452, "relation":"dhcpPoolLink"}, "2":{"id":12, "resource_id1":1422, "resource_id2":1482, "relation":"dhcpPoolLink"}}}</td> </tr> <tr> <td>ERROR:</td> <td>{ "success":0, "message":"error message" }</td> </tr> </table> <p>Return Detail:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>id</td> <td>INTEGER</td> <td>Id of the pool-module linkage</td> </tr> <tr> <td>resource_id1</td> <td>INTEGER</td> <td>The id of the dhcp_module resource</td> </tr> <tr> <td>resource_id2</td> <td>INTEGER</td> <td>The id of the dhcp_pool resource</td> </tr> <tr> <td>relation</td> <td>STRING</td> <td>The relation type. Always 'dhcpPoolLink'</td> </tr> </tbody> </table> <p>Meta Attributes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>totalRecords</td> <td>INTEGER</td> <td>How many records were found by this query, without pagination.</td> </tr> <tr> <td>retrieved</td> <td>INTEGER</td> <td>How many records were returned by this query, with pagination.</td> </tr> </tbody> </table>	SUCCESSFUL:	{ "success":1, "message":"Search successful", "data":{"meta":{"totalRecords":3, "retrieved":3}, "0":{"id":22, "resource_id1":1292, "resource_id2":1302, "relation":"dhcpPoolLink"}, "1":{"id":2, "resource_id1":1292, "resource_id2":1452, "relation":"dhcpPoolLink"}, "2":{"id":12, "resource_id1":1422, "resource_id2":1482, "relation":"dhcpPoolLink"}}}	ERROR:	{ "success":0, "message":"error message" }	Name	Type	Description	id	INTEGER	Id of the pool-module linkage	resource_id1	INTEGER	The id of the dhcp_module resource	resource_id2	INTEGER	The id of the dhcp_pool resource	relation	STRING	The relation type. Always 'dhcpPoolLink'	Name	Type	Description	totalRecords	INTEGER	How many records were found by this query, without pagination.	retrieved	INTEGER	How many records were returned by this query, with pagination.
SUCCESSFUL:	{ "success":1, "message":"Search successful", "data":{"meta":{"totalRecords":3, "retrieved":3}, "0":{"id":22, "resource_id1":1292, "resource_id2":1302, "relation":"dhcpPoolLink"}, "1":{"id":2, "resource_id1":1292, "resource_id2":1452, "relation":"dhcpPoolLink"}, "2":{"id":12, "resource_id1":1422, "resource_id2":1482, "relation":"dhcpPoolLink"}}}																												
ERROR:	{ "success":0, "message":"error message" }																												
Name	Type	Description																											
id	INTEGER	Id of the pool-module linkage																											
resource_id1	INTEGER	The id of the dhcp_module resource																											
resource_id2	INTEGER	The id of the dhcp_pool resource																											
relation	STRING	The relation type. Always 'dhcpPoolLink'																											
Name	Type	Description																											
totalRecords	INTEGER	How many records were found by this query, without pagination.																											
retrieved	INTEGER	How many records were returned by this query, with pagination.																											

add a new DHCP Pool linkage

Description	Adds a new link between a DHCP Pool and a dhcp_module resource. A single pool can be linked to many dhcp_modules, and a single dhcp_module can have any number of linked pools.
URL	/api/v1/api.php?target=resource&action=addLink&resource_id1=1292&resource_id2=2162&relation=dhcpPoolLink

Returns	Examples:		
	SUCCESSFUL:	<code>{"success":1,"message":"Resource link added"}</code>	
	ERROR:	<code>{"success":0, "message":"error message"}</code>	
	Data Detail:		
	Name	Type	Description
	resource_id1	INTEGER	The id of the dhcp_module resource
	resource_id2	INTEGER	The id of the dhcp_pool resource
	relation	STRING	The relation type being added. Always 'dhcpPoolLink'

<i>delete DHCP Pool linkages</i>		
Description	Deletes a link between a dhcp_module and a dhcp_pool. Uses the standard Resource Linkage endpoints.	
URL	/api/v1/api.php?target=resource&action=deleteLink&id=22	
Returns	Examples:	
	SUCCESSFUL:	<code>{"success":1,"message":"Resource link(s) deleted."}</code>
	ERROR:	<code>{"success":0, "message":"error message"}</code>

<i>push a DHCP config</i>			
Description	Builds a DHCP configuration from the attributes assigned to a dhcp_module and all of the linked dhcp_pools. Pushes that config to the configured DHCP server, tests it against the config parsing function, then restarts the server with the new configuration.		
URL	/api/v1/api.php?target=dhcp&action=push&id=1292		
Returns	Examples:		
	SUCCESSFUL:	<code>{"success":1,"message":"Pushes Attempted.", "data":[[1,"1292","381 DHCP Module","Configuration successfully pushed."]]}</code>	
	ERROR:	<code>{"success":0, "message":"error message"}</code>	
	Data Detail		
	Name	Type	Description
	id	INTEGER	The id of the dhcp_module resource whose configuration is to be pushed.

<i>DHCP search</i>	
Description	Searches DHCP information by name, mac, or IP.

URL	<p>/api/v1/api.php?target=dhcp&action=search&searchType=name&searchValue=Blah</p> <p>/api/v1/api.php?target=dhcp&action=search&searchType=mac&searchValue=22:</p> <p>/api/v1/api.php?target=dhcp&action=search&searchType=ip&searchValue=13.0.0.255</p>																																								
Returns	<p>Examples:</p> <table border="1" data-bbox="269 321 1497 443"> <tr> <td>SUCCESSFUL:</td> <td>{ "success":1, "message":"Search Successful", "data":{ "id":1482, "name":"BlahBlah", "slug":"blah", "type":"dhcp_pool", "parent_id":1, "category_id"</td> </tr> <tr> <td>ERROR:</td> <td>{ "success":0, "message":"error message"}</td> </tr> </table> <p>Return Detail</p> <table border="1" data-bbox="269 510 1049 846"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>id</td> <td>INTEGER</td> <td>ID of the dhcp_module resource</td> </tr> <tr> <td>name</td> <td>STRING</td> <td>The name of the dhcp_module</td> </tr> <tr> <td>slug</td> <td>STRING</td> <td>The unique reference string for this resource</td> </tr> <tr> <td>type</td> <td>STRING</td> <td>Always 'dhcp_pool'</td> </tr> <tr> <td>parent_id</td> <td>INTEGER</td> <td>The resource to which the dhcp_module is attached</td> </tr> <tr> <td>category_id</td> <td>INTEGER</td> <td>The category to which this dhcp_module is associated</td> </tr> </tbody> </table> <p>Attributes</p> <table border="1" data-bbox="269 913 1497 1157"> <thead> <tr> <th>Key</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>_dhcp_type</td> <td>STRING</td> <td>Either 'subnet' or 'host'. Determines whether this DHCP Pool is describing a Subnet or a Hos</td> </tr> <tr> <td>_dhcp_pool_attributes</td> <td>JSON</td> <td>A JSON-encoded string containing all the specific configuration parameters which govern this</td> </tr> <tr> <td>_dhcp_ip_id</td> <td>INTEGER</td> <td>The id of the IPAM subnet or host which is assigned to this DHCP Pool.</td> </tr> <tr> <td>_dhcp_links</td> <td>INTEGER</td> <td>The id of dhcp links.</td> </tr> </tbody> </table>	SUCCESSFUL:	{ "success":1, "message":"Search Successful", "data":{ "id":1482, "name":"BlahBlah", "slug":"blah", "type":"dhcp_pool", "parent_id":1, "category_id"	ERROR:	{ "success":0, "message":"error message"}	Name	Type	Description	id	INTEGER	ID of the dhcp_module resource	name	STRING	The name of the dhcp_module	slug	STRING	The unique reference string for this resource	type	STRING	Always 'dhcp_pool'	parent_id	INTEGER	The resource to which the dhcp_module is attached	category_id	INTEGER	The category to which this dhcp_module is associated	Key	Type	Description	_dhcp_type	STRING	Either 'subnet' or 'host'. linkedTo	INTEGER	1422	The ID of the resource's DHCP link(s)																																						

Data Attributes

_dhcp_attributes

Description The _dhcp_attributes data attribute holds the specific settings used to generate a DHCP configuration file, place it on a server via SCP, and restart that server via a SSH session.

Example: `{ "type": "ISC", "notes": "notes here", "username": "username", "port": "22", "config_test": "/etc/init.d/dhcpd configtest", "server_stop": "/etc/init.d/dhcpd stop", "server_start": "/etc/init.d/dhcpd start", "config_path": "/tmp/dhcpd.conf", "option_routers": "", "option_domain_name_servers": "", "option_domain_name": "", "authoritative": "1", "default_lease_time": "600", "max_lease_time": "7200", "local_port": "67", "log_facility": "local7", "password": "", "server_ip": "10.0.0.0", "freeLines": 0 }`

Data Description

Name	Type	Description
type	STRING	The type of DHCP server being administered. Currently only 'ISC' is supported.
notes	STRING	Notes associated with this DHCP server
server_ip	STRING	The IP address of the DHCP server
username	STRING	The SSH username employed when transferring the DHCP configuration file to the server.
password	STRING	The SSH password employed when transferring the DHCP configuration file to the server.
port	INTEGER	The SSH port employed when transferring the DHCP configuration file to the server.
config_test	STRING	The command to test if a configuration file parses correctly. ex: /etc/init.d/dhcpd configtest
server_stop	STRING	The command to stop the DHCP server. ex: /etc/init.d/dhcpd stop
server_start	STRING	The command to start the DHCP server. ex: /etc/init.d/dhcpd start
config_path	STRING	Where to place the configuration file on the server.
authoritative	BOOL	Whether or not this DHCP server is authoritative.
default_lease_time	INTEGER	The default lease time for IPs distributed by this DHCP server.
max_lease_time	INTEGER	The max lease time for IPs distributed by this DHCP server.
local_port	INTEGER	The port on which this DHCP server listens
option_routers	STRING	The information which populates the "routers" option in the DHCP configuration
option_domain_name_servers	STRING	The information which populates the "domain_name_servers" option in the DHCP configuration
option_domain_name	STRING	The information which populates the "domain_name" option in the DHCP configuration
log_facility	STRING	The log facility to which this DHCP Server sends its logging information
freeLines	INTEGER	As this system cannot hope to support all the thousands of different DHCP configurations, ProVision's DHCPv2 system includes a mechanism for adding "free lines" to the end of certain DHCP config sections so that administrators can customize their DHCP config file to their needs. The "freeLines" field indicates how many of these lines exist to be inserted after the general server definition section but before the subnets and hosts are enumerated.
freeLine#	STRING	Free line data to be inserted after the general server definition section but before the subnets and hosts are enumerated. There can be multiple instances of this attribute, numbered appropriately. ex: "freeLine1", "freeLine2", "freeLine3", etc. The number of freeLine# entries must match the number in the "freeLines" attribute.

_dhcp_pool_attributes

Description	A JSON-encoded string containing all the specific configuration parameters which govern this DHCP Pool.	
Example:	{ "mac": "ab:cc:de:ff:aa:bc", "rangeStart": "13.0.0.0", "rangeEnd": "13.0.0.255", "freeLines": 1, "freeLines1": "free line" }	
	Data Description	
	Name	Type
	Description	
mac	STRING	Only used when setting up a DHCP Host-type Pool. Holds the MAC address of the system to which the IP will be associated.
rangeStart	STRING	Only used when setting up a DHCP Subnet-type Pool. Holds the beginning of the Subnet range being allocated.
rangeEnd	STRING	Only used when setting up a DHCP Subnet-type Pool. Holds the end of the Subnet range being allocated.
freeLines	INTEGER	As this system cannot hope to support all the thousands of different DHCP configurations, ProVision's DHCPv2 system includes a mechanism for adding "free lines" to the end of certain DHCP config sections so that administrators can customize their DHCP config file to their needs. The "freeLines" field indicates how many of these lines exist to be inserted within the DHCP Pool declaration.
freeLine#	STRING	Free line data to be inserted after the general server definition section but before the subnets and hosts are enumerated. There can be multiple instances of this attribute, numbered appropriately. ex: "freeLine1", "freeLine2", "freeLine3", etc. The number of freeLine# entries must match the number in the "freeLines" attribute.

DNS Server Control

get	
URL	/api/v1/api.php?target=dnsServer&action=get
Description	If provided with an id, fetches that DNS Server from the database. If not, fetches a list of all stored DNS Servers

Returns

Examples:

SUCCESSFUL:	<pre>{ "success":1, "message":"Fetch Successful.", "data":{"id":"10", "server":"mrbomasm-dns-4.onnet.net", "username":"SCP", "remote_directory":"zones", "named_conf_path":"\\Vetc\\zones", "active":"1", "post_command":null, "pre_command":"powerdns_backend":"Bind", "db_username":null, "db_password":null, "db_port":null, "db_name":null, "server_type":"SOA", "remote_directory":"zones", "named_conf_path":"\\Vetc\\zones", "dyn_DNSSEC_contact":null, "db_username":null, "db_password":null, "db_port":null, "db_name":null, "enable_views":"1"}, "testID":"963", "server_id":"10", "name":"_6connectDefault", "extras":{}}, "description":"","timestamp":"1371789181" }</pre>
ERROR:	<pre>{ "success":0, "message":"error message" }</pre>

Data Detail:

Name	Type	Description
id	INTEGER	Server ID
server	STRING	Server Name
username	STRING	Login Name
password	CRYPT	Login Password
port	INTEGER	Port the Server listens on
zoneCount	INTEGER	The number of zones attached to this server.
options	JSON	The options entry is a JSON-encoded string containing a variety of server-specific configuration c This string will vary widely by server type and configuration. The following are a selection of com
transfer_type	STRING	Protocol used for transfer of DNS zones and records. Valid settings include SCP, PowerDNS, Se
server_type	STRING	Whether this server is a master or a slave server
SOA	STRING	The SOA entry to be used for zones on this server
remote_directory	STRING	The directory where SCP will place the zone files.
named_conf_path	STRING	The path to the zone files used within the named.conf file.
pre_command	STRING	The command executed on the server before the zones are transferred
post_command	STRING	The command executed on the server after the transfer is complete
enable_views	INTEGER	Whether or not Views are enabled
views	JSON	The views entry is a JSON-encoded string containing all the information about the Views attache
id	INTEGER	The View ID
server_id	INTEGER	The ID of the server the View is attached to
name	STRING	The name of the View
description	STRING	A description of the View
timestamp	INTEGER	The UNIX timestamp of when the view was created.
extras	JSON	A JSON-encoded array of the extra attributes printed out in the view definition in the config file.

Required Parameters

None

Optional Parameters

Name	Type	Example	Description
id	INTEGER	15	The server id to fetch.

Example URL	/api/v1/api.php?target=dnsServer&action=get&id=15
-------------	---

add

URL	/api/v1/api.php?target=dnsServer&action=add
-----	---

Description	Adds a new DNS Server
-------------	-----------------------

Returns	<p>Examples:</p> <table border="1"> <tr> <td>SUCCESSFUL:</td> <td>{"success":1,"message":"Add Successful."}</td> </tr> <tr> <td>ERROR:</td> <td>{"success":0, "message":"error message"}</td> </tr> </table>	SUCCESSFUL:	{"success":1,"message":"Add Successful."}	ERROR:	{"success":0, "message":"error message"}
SUCCESSFUL:	{"success":1,"message":"Add Successful."}				
ERROR:	{"success":0, "message":"error message"}				

Required Parameters	Name	Type	Example	Description
	server	STRING	dns.yourdomain.com	IP or FQDN of the DNS Server
	password	STRING	password1	Login password for Server
	transferType	STRING	SCP	Protocol used for transfer of DNS zones and records. Valid settings include SCP, PowerDNS, Secure64, Secure64Signer
	serverType	STRING	Master	Values are 'Master' or 'Slave' only
	displayName	STRING	Primary NS	The name displayed representing the DNS server, can be the same as server or different
	SOA	STRING	ns1.6connect.com. hostmaster.6connect.com.	Server of Authority record for DNS server

Optional Parameters	These optional parameters vary according to what type of server is being configured.
---------------------	--

Name	Type	Example	Description
customerName	STRING	/tmp/zones	Customer Name
remoteDirectory	STRING	/tmp/zones	Zone Directory on Server
port	INTEGER	22	Port for ssh or scp access to server
namedConfPath	STRING	/tmp	The path to the zone files used within the named.conf file.
preCommand	STRING	/path/to/stuff/precommand	Command to execute before zone transfer
postCommand	STRING	/path/to/stuff/postcommand	Command to execute after zone transfer
DNSSECContact	STRING	joeuser	For use with Dyn dns service
username	STRING	bobuser	Login name for Server
active	INTEGER	0	Values 0 or 1 only, sets the server to inactive on 0 value
masterId	INTEGER	53	Master server ID. If a server is a slave, masterId points to its master.
powerDNSBackend	STRING	Bind or MySQL	pDNS server backend type
dbDatabaseName	STRING	pdns_1	DB name for pDNS servers with MySQL powerDNSBackend type
dbPort	INTEGER	3306	Port for for pDNS servers with MySQL powerDNSBackend type
dbUsername	STRING	someuser	DB username for pDNS servers with MySQL powerDNSBackend type
dbPassword	STRING	somepass	DB password for pDNS servers with MySQL powerDNSBackend type

Example URL	/api/v1/api.php?target=dnsServer&action=add&server=dns.yourdomain.com&transferType=Secure64&displayName=PrimaryNS &serverType=master&password=password1&SOA=ns1.6connect.com.+hostmaster.6connect.com.
-------------	--

delete									
URL	/api/v1/api.php?target=dnsServer&action=delete								
Description	Deletes a DNS Server								
Returns	<p>Examples:</p> <table border="1"> <tr> <td>SUCCESSFUL:</td> <td>{"success":1,"message":"Delete Successful."}</td> </tr> <tr> <td>ERROR:</td> <td>{"success":0, "message":"error message"}</td> </tr> </table>	SUCCESSFUL:	{"success":1,"message":"Delete Successful."}	ERROR:	{"success":0, "message":"error message"}				
SUCCESSFUL:	{"success":1,"message":"Delete Successful."}								
ERROR:	{"success":0, "message":"error message"}								
Required Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>id</td> <td>INTEGER</td> <td>5</td> <td>ID of server to delete</td> </tr> </tbody> </table>	Name	Type	Example	Description	id	INTEGER	5	ID of server to delete
Name	Type	Example	Description						
id	INTEGER	5	ID of server to delete						
Optional Parameters	None								
Example URL	/api/v1/api.php?target=dnsServer&action=delete&id=5								

update																					
URL	/api/v1/api.php?target=dnsServer&action=update																				
Description	Updates an existing DNS Server with new information.																				
Returns	<p>Examples:</p> <table border="1"> <tr> <td>SUCCESSFUL:</td> <td>{"success":1,"message":"Update Successful."}</td> </tr> <tr> <td>ERROR:</td> <td>{"success":0, "message":"error message"}</td> </tr> </table>	SUCCESSFUL:	{"success":1,"message":"Update Successful."}	ERROR:	{"success":0, "message":"error message"}																
SUCCESSFUL:	{"success":1,"message":"Update Successful."}																				
ERROR:	{"success":0, "message":"error message"}																				
Required Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>id</td> <td>INTEGER</td> <td>5</td> <td>ID of server</td> </tr> <tr> <td>server</td> <td>STRING</td> <td>dns.yourdomain.com</td> <td>IP or FQDN of the DNS Server</td> </tr> <tr> <td>SOA</td> <td>STRING</td> <td>ns1.6connect.com. hostmaster.6connect.com.</td> <td>Server of Authority record for DNS server</td> </tr> <tr> <td>transferType</td> <td>STRING</td> <td>SCP</td> <td>Protocol used for transfer of DNS zones and records. Valid settings include SCP, PowerDNS, Secure64, Secure64Signer</td> </tr> </tbody> </table>	Name	Type	Example	Description	id	INTEGER	5	ID of server	server	STRING	dns.yourdomain.com	IP or FQDN of the DNS Server	SOA	STRING	ns1.6connect.com. hostmaster.6connect.com.	Server of Authority record for DNS server	transferType	STRING	SCP	Protocol used for transfer of DNS zones and records. Valid settings include SCP, PowerDNS, Secure64, Secure64Signer
Name	Type	Example	Description																		
id	INTEGER	5	ID of server																		
server	STRING	dns.yourdomain.com	IP or FQDN of the DNS Server																		
SOA	STRING	ns1.6connect.com. hostmaster.6connect.com.	Server of Authority record for DNS server																		
transferType	STRING	SCP	Protocol used for transfer of DNS zones and records. Valid settings include SCP, PowerDNS, Secure64, Secure64Signer																		

Optional Parameters	These optional parameters vary according to what type of server is being configured.			
	Name	Type	Example	Description
	active	INTEGER	0	Values 0 or 1 only, sets the server to inactive on 0 value
	customerName	STRING	/tmp/zones	Customer Name
	dbDatabaseName	STRING	pdns_1	DB name for pDNS servers with MySQL powerDNSBackend type
	dbPassword	STRING	somepass	DB password for pDNS servers with MySQL powerDNSBackend type
	dbPort	INTEGER	3306	Port for for pDNS servers with MySQL powerDNSBackend type
	dbUsername	STRING	someuser	DB username for pDNS servers with MySQL powerDNSBackend type
	displayName	STRING	Primary NS	The name displayed representing the DNS server, can be the same as server or different
	DNSSECContact	STRING	joeuser	For use with Dyn dns service
	enable_views	INTEGER	1	Whether or not Views are enabled. Valid values are '1' for enable or '0' for do not enable
	masterId	INTEGER	53	Master server ID. If a server is a slave, masterId points to its master.
	namedConfPath	STRING	/tmp	The path to the zone files used within the named.conf file.
	password	STRING	password1	Login password for Server
	port	INTEGER	22	Port for ssh or scp access to server
	powerDNSBackend	STRING	Bind or MySQL	pDNS server backend type
	postCommand	STRING	/path/to/stuff/postcommand	Command to execute after zone transfer
	preCommand	STRING	/path/to/stuff/precommand	Command to execute before zone transfer
remoteDirectory	STRING	/tmp/zones	Zone Directory on Server	
serverType	STRING	Master	Values are 'Master' or 'Slave' only	
username	STRING	bobuser	Login name for Server	
Example URL	/api.php?target=dnsServer&action=update&id=74&transferType=SCP&server=dns.yourdomain.com &SOA=ns1.6connect.com.+hostmaster.6connect.com.			

transferServer									
URL	/api/v1/api.php?target=dnsServer&action=transferServer								
Description	Performs a full zone push on a DNS Server, executing pre and post commands, transferring files, and restarting services.								
Returns	<p>Examples:</p> <table border="1"> <tr> <td>SUCCESSFUL:</td> <td>{"success":1,"message":"Transfer Successful."}</td> </tr> <tr> <td>ERROR:</td> <td>{"success":0,"message":"error message"}</td> </tr> </table>	SUCCESSFUL:	{"success":1,"message":"Transfer Successful."}	ERROR:	{"success":0,"message":"error message"}				
SUCCESSFUL:	{"success":1,"message":"Transfer Successful."}								
ERROR:	{"success":0,"message":"error message"}								
Required Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>push</td> <td>INTEGER</td> <td>1</td> <td>The ID of the server to push zones to</td> </tr> </tbody> </table>	Name	Type	Example	Description	push	INTEGER	1	The ID of the server to push zones to
Name	Type	Example	Description						
push	INTEGER	1	The ID of the server to push zones to						

Optional Parameters	None
Example URL	/api/v1/api.php?target=dnsServer&action=transferServer&push=1

transferSingle									
URL	/api/v1/api.php?target=dnsServer&action=transferSingle								
Description	Transfers a single Zone file to all its associated DNS Servers, along with updated server configurations. Performs pre and post commands on the target servers, transfers the zone file(s), and restarts services.								
Returns	<p>Examples:</p> <table border="1"> <tr> <td>SUCCESSFUL:</td> <td>{"success":1,"message":"Updated Zone: \$name.zone on \$server via SCP"}</td> </tr> <tr> <td>ERROR:</td> <td>{"success":0, "message":"error message"}</td> </tr> </table>	SUCCESSFUL:	{"success":1,"message":"Updated Zone: \$name.zone on \$server via SCP"}	ERROR:	{"success":0, "message":"error message"}				
SUCCESSFUL:	{"success":1,"message":"Updated Zone: \$name.zone on \$server via SCP"}								
ERROR:	{"success":0, "message":"error message"}								
Required Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>zoneId</td> <td>INTEGER</td> <td>35</td> <td>The ID of the zone to push</td> </tr> </tbody> </table>	Name	Type	Example	Description	zoneId	INTEGER	35	The ID of the zone to push
Name	Type	Example	Description						
zoneId	INTEGER	35	The ID of the zone to push						
Optional Parameters	None								
Example URL	/api/v1/api.php?target=dnsServer&action=transferSingle&zoneId=35								

DNS Zone Control

get	
URL	/api/v1/api.php?target=zone&action=get
Description	Accepts search criteria to retrieve a list of all matching DNS Zones and associated Records. Search can be performed on any combination of Zone and Record attributes.

Returns	Examples:																																																																											
	<table border="1"> <tr> <td>SUCCESSFUL:</td> <td><pre>{ "success":1, "message":"Search Successful.", "data":{"zoneId":"932","zoneName":"185.160.209.in-addr.arpa","zoneSerial":"2013040302","zoneRefresh":"28800","zoneRetry":"7200","zoneExpire":"604800","zoneMinimum":"","zoneTTL":"28800","zoneAutoCheck":"1","zoneEnableDNSSEC":null,"recordId":"154110","recordZoneId":"932","185.160.209.inaddr.arpa.", "recordType":"NS", "recordValue":"auth01.veroxity.net.", "recordDescription":null, "recordOrdering":"1", "recordErrors":null, "assetId":"0", "userCanCreate":0, "userCanDelete":1, "userCanUpdate":1</pre></td> </tr> <tr> <td>ERROR:</td> <td><pre>{ "success":0, "message":"error message"}</pre></td> </tr> </table>	SUCCESSFUL:	<pre>{ "success":1, "message":"Search Successful.", "data":{"zoneId":"932","zoneName":"185.160.209.in-addr.arpa","zoneSerial":"2013040302","zoneRefresh":"28800","zoneRetry":"7200","zoneExpire":"604800","zoneMinimum":"","zoneTTL":"28800","zoneAutoCheck":"1","zoneEnableDNSSEC":null,"recordId":"154110","recordZoneId":"932","185.160.209.inaddr.arpa.", "recordType":"NS", "recordValue":"auth01.veroxity.net.", "recordDescription":null, "recordOrdering":"1", "recordErrors":null, "assetId":"0", "userCanCreate":0, "userCanDelete":1, "userCanUpdate":1</pre>	ERROR:	<pre>{ "success":0, "message":"error message"}</pre>																																																																							
SUCCESSFUL:	<pre>{ "success":1, "message":"Search Successful.", "data":{"zoneId":"932","zoneName":"185.160.209.in-addr.arpa","zoneSerial":"2013040302","zoneRefresh":"28800","zoneRetry":"7200","zoneExpire":"604800","zoneMinimum":"","zoneTTL":"28800","zoneAutoCheck":"1","zoneEnableDNSSEC":null,"recordId":"154110","recordZoneId":"932","185.160.209.inaddr.arpa.", "recordType":"NS", "recordValue":"auth01.veroxity.net.", "recordDescription":null, "recordOrdering":"1", "recordErrors":null, "assetId":"0", "userCanCreate":0, "userCanDelete":1, "userCanUpdate":1</pre>																																																																											
ERROR:	<pre>{ "success":0, "message":"error message"}</pre>																																																																											
	Data Detail:																																																																											
	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>zoneId</td> <td>INTEGER</td> <td>The Id of the Zone entry. A single Zone entry might have multiple Records.</td> </tr> <tr> <td>zoneName</td> <td>STRING</td> <td>The Zone name.</td> </tr> <tr> <td>zoneResourceId</td> <td>INTEGER</td> <td>The resource Id associated with this Zone.</td> </tr> <tr> <td>zoneSerial</td> <td>INTEGER</td> <td>Zone Serial.</td> </tr> <tr> <td>zoneRefresh</td> <td>INTEGER</td> <td>Zone Refresh.</td> </tr> <tr> <td>zoneRetry</td> <td>INTEGER</td> <td>Zone Retry.</td> </tr> <tr> <td>zoneExpire</td> <td>INTEGER</td> <td>Zone Expire.</td> </tr> <tr> <td>zoneMinimum</td> <td>INTEGER</td> <td>Zone Minimum.</td> </tr> <tr> <td>zoneSOA</td> <td>STRING</td> <td>Zone SOA.</td> </tr> <tr> <td>zoneTTL</td> <td>STRING</td> <td>Zone TTL.</td> </tr> <tr> <td>zoneEnableDNSSEC</td> <td>BOOL</td> <td>Whether or not DNSSEC is enabled for this Zone.</td> </tr> <tr> <td>zoneAutoCheck</td> <td>BOOL</td> <td>Whether or not this zone is configured to be automatically validated on load/edit.</td> </tr> <tr> <td>recordId</td> <td>INTEGER</td> <td>The Id of this Record Entry. Name	Type	Description																																																																										
zoneId	INTEGER	The Id of the Zone entry. A single Zone entry might have multiple Records.																																																																										
zoneName	STRING	The Zone name.																																																																										
zoneResourceId	INTEGER	The resource Id associated with this Zone.																																																																										
zoneSerial	INTEGER	Zone Serial.																																																																										
zoneRefresh	INTEGER	Zone Refresh.																																																																										
zoneRetry	INTEGER	Zone Retry.																																																																										
zoneExpire	INTEGER	Zone Expire.																																																																										
zoneMinimum	INTEGER	Zone Minimum.																																																																										
zoneSOA	STRING	Zone SOA.																																																																										
zoneTTL	STRING	Zone TTL.																																																																										
zoneEnableDNSSEC	BOOL	Whether or not DNSSEC is enabled for this Zone.																																																																										
zoneAutoCheck	BOOL	Whether or not this zone is configured to be automatically validated on load/edit.																																																																										
recordId	INTEGER	The Id of this Record Entry. It is always included with its parent Zone.																																																																										
recordHost	STRING	The Hostname of this Record.																																																																										
recordType	STRING	The Record Type (MX,NS,A,PTR,etc)																																																																										
recordValue	STRING	The Value of this Record.																																																																										
recordDescription	STRING	A short description of this Record.																																																																										
recordTTL	STRING	The TTL of this Record.																																																																										
recordOrdering	INTEGER	The numerical order in which the record appears in the zone.																																																																										
recordErrors	STRING	A string containing any detected problems with this record																																																																										
userCanCreate	BOOL	Whether or not the user has DNS CREATE permissions on this zone's resource																																																																										
userCanUpdate	BOOL	Whether or not the user has DNS UPDATE permissions on this zone's resource																																																																										
userCanDelete	BOOI	Whether or not the user has DNS DELETE permissions on this zone's resource																																																																										
unpagedRows	INTEGER	If pagination is used, this value will contain a total count of records had the pagination not been used.																																																																										
Required Parameters	None																																																																											

Optional Parameters

Name	Type	Example	Description
likeFlag	BOOL	1	When 1, string searches are done via LIKE with wildcards at both ends. When 0, strict comp
generalFlag	BOOL	1	When 1, searches over the provided parameters using OR. If 0 or omitted, uses AND.
selectCount	INTEGER	30	When supplied only returns the first X entries

Name	Type	Example	Description
zoneld	INTEGER	123	The Zone Id to search for.
zoneName	STRING	foo	The Zone Name to search for.
zoneResourceId	INTEGER	5	The Resource Id to search for.
zoneSerial	INTEGER	2012033001	The Zone Serial to search for.
zoneRefresh	INTEGER	36000	The Zone Refresh to search for.
zoneRetry	INTEGER	800	The Zone Retry to search for.
zoneExpire	INTEGER	6090000	The Zone Expire to search for.
zoneMinimum	INTEGER	10	The Zone Minimum to search for.
zoneSOA	STRING	200	The Zone SOA to search for.
zoneTTL	INTEGER	3600	The Zone TTL to search for.
zoneEnableDNSSEC	INTEGER	1	Search based on DNSSEC settings.
recordId	INTEGER	123	The Record Id to search for.
recordZoneld	INTEGER	123	The parent Zone to search for.
recordHost	STRING	@	The Record Host to search for.
recordType	STRING	NS	The Record Type to search for.
recordValue	STRING	ns1.dns.6connect.com.	The Record Value to search for.
recordDescription	STRING	Description	Search based on Record Description.
recordTTL	STRING	3600	The Record TTL to search for.

Example URL

/api/v1/api.php?target=zone&action=get&zoneld=123

search

URL

/api/v1/api.php?target=zone&action=search

Description

Accepts search criteria to retrieve a list of all matching DNS Zones but NO associated Records. Search can be performed on any c

Returns	<p>Examples:</p> <table border="1" data-bbox="269 184 1494 304"> <tr> <td data-bbox="269 184 440 258">SUCCESSFUL:</td> <td data-bbox="444 184 1494 258">{"success":1,"message":"Search Successful.,"data":[{"zoneId":"123","zoneName":"foobs.net","zoneResourceId":"483","zoneIpver":null,"zoneMas</td> </tr> <tr> <td data-bbox="269 264 440 304">ERROR:</td> <td data-bbox="444 264 1494 304">{"success":0,"message":"error message"}</td> </tr> </table> <p>Data Detail:</p> <table border="1" data-bbox="269 396 1494 1270"> <thead> <tr> <th data-bbox="269 396 488 445">Name</th> <th data-bbox="493 396 610 445">Type</th> <th data-bbox="615 396 1494 445">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="269 451 488 491">zoneId</td> <td data-bbox="493 451 610 491">INTEGER</td> <td data-bbox="615 451 1494 491">The Id of the Zone entry. zoneSOA	STRING	Zone SOA.																																																									
zoneTTL	STRING	Zone TTL.																																																									
zoneEnableDNSSEC	BOOL	Whether or not DNSSEC is enabled for this Zone.																																																									
zoneAutoCheck	BOOL	Whether or not this zone is configured to be automatically validated on load/edit.																																																									
recordCount	INTEGER	How many records are associated with this zone.																																																									
userCanCreate	BOOL	Whether or not the user has DNS CREATE permissions on this zone's resource																																																									
userCanUpdate	BOOL	Whether or not the user has DNS UPDATE permissions on this zone's resource																																																									
userCanDelete	BOOI	Whether or not the user has DNS DELETE permissions on this zone's resource																																																									
unpagedRows	INTEGER	If pagination is used, this value will contain a total count of records had the pagination not bee																																																									
Required Parameters	None																																																										

Optional Parameters	Name	Type	Example	Description
	likeFlag	BOOL	1	When 1, string searches are done via LIKE with wildcards at b
	generalFlag	BOOL	1	When 1, searches over the provided parameters using OR. I
	selectCount	INTEGER	30	When supplied only returns the first X entries
	selectOffset	INTEGER	10	When supplied, only returns entries after record X
	sortBy	JSON	{"zoneName":"desc","zoneMask":"asc"}	A JSON-encoded object containing a list of columns to sort on
	Name	Type	Example	Description
	zoneId	INTEGER	123	The Zone Id to search for.
	zoneName	STRING	foo	The Zone Name to search for.
	zoneResourceId	INTEGER	5	The Resource Id to search for.
	zoneSerial	INTEGER	2012033001	The Zone Serial to search for.
	zoneRefresh	INTEGER	36000	The Zone Refresh to search for.
	zoneRetry	INTEGER	800	The Zone Retry to search for.
	zoneExpire	INTEGER	6090000	The Zone Expire to search for.
	zoneMinimum	INTEGER	10	The Zone Minimum to search for.
	zoneSOA	STRING	200	The Zone SOA to search for.
	zoneTTL	INTEGER	3600	The Zone TTL to search for.
	zoneEnableDNSSEC	INTEGER	1	Search based on DNSSEC settings.
	recordId	INTEGER	123	The Record Id to search for.
	recordZoneId	INTEGER	123	The parent Zone to search for.
recordHost	STRING	@	The Record Host to search for.	
recordType	STRING	NS	The Record Type to search for.	
recordValue	STRING	ns1.dns.6connect.com.	The Record Value to search for.	
recordDescription	STRING	Description	Search based on Record Description.	
recordTTL	STRING	3600	The Record TTL to search for.	
Example URL	/api/v1/api.php?target=zone&action=search&zoneId=123			

update					
URL	/api/v1/api.php?target=zone&action=update				
Description	First performs a search based on the submitted Zone and Record criteria, then performs an Update across those entries based on new values.				
Returns	<p>Examples:</p> <table border="1"> <tr> <td>SUCCESSFUL:</td> <td>{"success":1,"message":"Update Successful."}</td> </tr> <tr> <td>ERROR:</td> <td>{"success":0,"message":"error message"}</td> </tr> </table>	SUCCESSFUL:	{"success":1,"message":"Update Successful."}	ERROR:	{"success":0,"message":"error message"}
SUCCESSFUL:	{"success":1,"message":"Update Successful."}				
ERROR:	{"success":0,"message":"error message"}				
Required Parameters	None				
Optional Parameters					

Name	Type	Example	Description
likeFlag	BOOL	1	When 1, string searches are done via LIKE with wildcards at both ends. When 0, strict comparison is used.
generalFlag	BOOL	1	When 1, searches over the provided parameters using OR. If 0 or omitted, uses AND.

Name	Type	Example	Description
searchZoneId	INTEGER	123	The Zone Id to search for.
searchZoneName	STRING	foo	The Zone Name to search for.
searchZoneResourceId	INTEGER	5	The Resource Id to search for.
searchZoneSerial	INTEGER	2012033001	The Zone Serial to search for.
searchZoneRefresh	INTEGER	36000	The Zone Refresh to search for.
searchZoneRetry	INTEGER	800	The Zone Retry to search for.
searchZoneExpire	INTEGER	6090000	The Zone Expire to search for.
searchZoneMinimum	INTEGER	10	The Zone Minimum to search for.
searchZoneSOA	STRING	200	The Zone SOA to search for.
searchZoneTTL	INTEGER	3600	The Zone TTL to search for.
searchZoneEnableDNSSEC	INTEGER	1	Search based on DNSSEC settings.
searchRecordId	INTEGER	123	The Record Id to search for.
searchRecordHost	STRING	@	The Record Host to search for.
searchRecordType	STRING	NS	The Record Type to search for.
searchRecordValue	STRING	ns1.dns.6connect.com.	The Record Value to search for.
searchRecordDescription	STRING	Description	Search based on Record Description.
searchRecordTTL	STRING	3600	The Record TTL to search for.

Name	Type	Example	Description
updateZoneName	STRING	foo	The Zone name to replace into the searched rows.
updateZoneSerial	INTEGER	2012033001	The Zone Serial to replace into the searched rows.
updateZoneRefresh	INTEGER	36000	The Zone Refresh to replace into the searched rows.
updateZoneRetry	INTEGER	800	The Zone Retry to replace into the searched rows..
updateZoneExpire	INTEGER	6090000	The Zone Expire to replace into the searched rows.
updateZoneMinimum	INTEGER	10	The Zone Minimum to replace into the searched rows.
updateZoneSOA	STRING	200	The Zone SOA to replace into the searched rows.
updateZoneTTL	INTEGER	3600	The Zone TTL to replace into the searched rows.
updateZoneEnableDNSSEC	INTEGER	1	Update DNSSEC Settings.
updateRecordHost	STRING	@	The Record Host to replace into the searched rows.
updateRecordType	STRING	NS	The Record Type to replace into the searched rows.
updateRecordValue	STRING	ns1.dns.6connect.com.	The Record Value to replace into the searched rows.
updateRecordDescription	STRING	Description	Update Record Descriptions.
updateRecordTTL	STRING	3600	The Record TTL to replace into the searched rows.
updateZoneAutoCheck	BOOL	1	Whether or not this zone is configured to be automatically validated on load/edit.

Name	Type	Example	Description
recordZoneId	INTEGER	123	The parent zone ID

Example URL `/api/v1/api.php?target=zone&action=update&searchZoneId=123&updateZoneExpire=6090000`

add

URL `/api/v1/api.php?target=zone&action=add`

Description Adds a new DNS Zone.

Returns

Examples:

SUCCESSFUL:	<code>{"success":1,"message":"Add Successful.,"data":123}</code>
ERROR:	<code>{"success":0, "message":"error message"}</code>

Data Detail:

Name	Type	Description
data	INTEGER	The Id of the new Zone entry.

Required Parameters

Name	Type	Example	Description
zoneName	STRING	254.221.67.in-addr.arpa	The name for the new Zone.

Optional Parameters	Name	Type	Example	Description
	likeFlag	BOOL	1	When 1, string searches are done via LIKE with wildcards at both ends. When 0, strict comparison is used.
	zoneIpver	STRING	IPv6	The IP Version.
	zoneLocalSigning	BOOL	1	Whether or not this zone should be signed by the ProVision server when DNSSEC is enabled. If set to false, ProVision will deliver the zone unsigned to the DNS server and the signing / updating process should be triggered by the post-push command
	zoneSerial	INTEGER	2012033001	Serial for the new Zone.
	zoneRefresh	INTEGER	36000	Refresh for the new Zone.
	zoneRetry	INTEGER	800	Retry for the new Zone.
	zoneExpire	INTEGER	6090000	Expire for the new Zone.
	zoneMinimum	INTEGER	10	Minimum for the new Zone.
	zoneSOA	STRING	200	SOA for the new Zone.
	zoneTTL	STRING	3600	TTL for the new Zone.
	zoneEnableDNSSEC	INTEGER	1	Whether or not this new zone uses DNSSEC.
Example URL	/api/v1/api.php?target=zone&action=add&zoneName=254.221.67.in-addr.arpa&zoneResourceId=123&zoneSerial=2012033001			

delete					
URL	/api/v1/api.php?target=zone&action=delete				
Description	Performs a search over the Zones and Records dataset and deletes all found Zones, plus all associated Records of those Zones.				
Returns	<p>Examples:</p> <table border="1"> <tr> <td>SUCCESSFUL:</td> <td>{"success":1,"message":"Zones and Associated Records Deleted."}</td> </tr> <tr> <td>ERROR:</td> <td>{"success":0, "message":"error message"}</td> </tr> </table>	SUCCESSFUL:	{"success":1,"message":"Zones and Associated Records Deleted."}	ERROR:	{"success":0, "message":"error message"}
SUCCESSFUL:	{"success":1,"message":"Zones and Associated Records Deleted."}				
ERROR:	{"success":0, "message":"error message"}				
Required Parameters	No specific parameter is required, however, one or more optional parameters must be used for a successful return				

Optional Parameters	Name	Type	Example	Description
	deleteZoneId	INTEGER	123	The Zone Id to search for.
	deleteZoneName	STRING	foo	The Zone Name to search for.
	deleteZoneResourceId	INTEGER	5	The Resource Id to search for.
	deleteZoneSerial	INTEGER	2012033001	The Zone Serial to search for.
	deleteZoneRefresh	INTEGER	36000	The Zone Refresh to search for.
	deleteZoneRetry	INTEGER	800	The Zone Retry to search for.
	deleteZoneExpire	INTEGER	6090000	The Zone Expire to search for.
	deleteZoneMinimum	INTEGER	10	The Zone Minimum to search for.
	deleteZoneSOA	STRING	200	The Zone SOA to search for.
	deleteZoneTTL	INTEGER	3600	The Zone TTL to search for.
	deleteZoneEnableDNSSEC	INTEGER	1	Search based on DNSSEC settings.
	deleteRecordId	INTEGER	123	The Record Id to search for.
	deleteRecordHost	STRING	@	The Record Host to search for.
	deleteRecordType	STRING	NS	The Record Type to search for.
	deleteRecordValue	STRING	ns1.dns.6connect.com.	The Record Value to search for.
	deleteRecordDescription	STRING	Description	Search based on Record Description.
deleteRecordTTL	STRING	3600	The Record TTL to search for.	
deleteRecordZoneId	INTEGER	123	The parent zone ID	
Example URL	/api/v1/api.php?target=zone&action=delete&deleteZoneId=123			

getRecordTypes

URL	/api/v1/api.php?target=zone&action=getRecordTypes										
Description	Returns a list of all Record Types allowed by the system.										
Returns	<p>Examples:</p> <table border="1"> <tr> <td>SUCCESSFUL:</td> <td>{ "success":1, "message":"Search Successful.", "data":{"recordType":"A"}, {"recordType":"AAAA"}, {"recordType":"MX"}, {"recordType":"CNAME"}, {"r</td> </tr> <tr> <td>ERROR:</td> <td>{ "success":0, "message":"error message" }</td> </tr> </table> <p>Data Detail:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>recordType</td> <td>STRING</td> <td>A Record Type</td> </tr> </tbody> </table>	SUCCESSFUL:	{ "success":1, "message":"Search Successful.", "data":{"recordType":"A"}, {"recordType":"AAAA"}, {"recordType":"MX"}, {"recordType":"CNAME"}, {"r	ERROR:	{ "success":0, "message":"error message" }	Name	Type	Description	recordType	STRING	A Record Type
SUCCESSFUL:	{ "success":1, "message":"Search Successful.", "data":{"recordType":"A"}, {"recordType":"AAAA"}, {"recordType":"MX"}, {"recordType":"CNAME"}, {"r										
ERROR:	{ "success":0, "message":"error message" }										
Name	Type	Description									
recordType	STRING	A Record Type									
Required Parameters	None										
Optional Parameters	None										
Example URL	/api/v1/api.php?target=zone&action=getRecordTypes										

getFile																	
URL	/api/v1/api.php?target=zone&action=getFile&zoneId=50																
Description	Returns a fully written zone file. If one does not exist, returns false.																
Returns	A Zone File																
Required Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>zoneId</td> <td>INTEGER</td> <td>50</td> <td>The Id of the zone to retrieve.</td> </tr> <tr> <td>format</td> <td>ENUMERATED</td> <td>'html' or ''</td> <td>If html, the zone file will be formatted for display via a web browser. If blank or omitted, the zone file will be formatted for display in a file system.</td> </tr> <tr> <td>unsigned</td> <td>BOOL</td> <td>1</td> <td>For a DNSSEC-enabled zone, determines whether or not the system retrieves the signed or unsigned zone file. Ignored for non-DNSSEC zones.</td> </tr> </tbody> </table>	Name	Type	Example	Description	zoneId	INTEGER	50	The Id of the zone to retrieve.	format	ENUMERATED	'html' or ''	If html, the zone file will be formatted for display via a web browser. If blank or omitted, the zone file will be formatted for display in a file system.	unsigned	BOOL	1	For a DNSSEC-enabled zone, determines whether or not the system retrieves the signed or unsigned zone file. Ignored for non-DNSSEC zones.
Name	Type	Example	Description														
zoneId	INTEGER	50	The Id of the zone to retrieve.														
format	ENUMERATED	'html' or ''	If html, the zone file will be formatted for display via a web browser. If blank or omitted, the zone file will be formatted for display in a file system.														
unsigned	BOOL	1	For a DNSSEC-enabled zone, determines whether or not the system retrieves the signed or unsigned zone file. Ignored for non-DNSSEC zones.														
Optional Parameters	None																
Example URL	/api/v1/api.php?target=zone&action=getFile&zoneId=50&zoneId=50&format=html&unsigned=1																

getDSFile									
URL	/api/v1/api.php?target=zone&action=getDSFile								
Description	Returns a fully written zone DS key file. If one does not exist, returns false.								
Returns	A Zone DS Key File								
Required Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>zoneId</td> <td>INTEGER</td> <td>50</td> <td>The Id of the zone whose DS keys are to be retrieved.</td> </tr> </tbody> </table>	Name	Type	Example	Description	zoneId	INTEGER	50	The Id of the zone whose DS keys are to be retrieved.
Name	Type	Example	Description						
zoneId	INTEGER	50	The Id of the zone whose DS keys are to be retrieved.						
Optional Parameters	None								
Example URL	/api/v1/api.php?target=zone&action=getDSFile&zoneId=50								

checkZone									
URL	/api/v1/api.php?target=zone&action=checkZone								
Description	Runs a zone file through Named checkzone								
Returns	<p>Examples:</p> <table border="1"> <tbody> <tr> <td>SUCCESSFUL:</td> <td>{"success":1,"message":"No errors found."}</td> </tr> <tr> <td>ERROR:</td> <td>{"success":0,"message":"21: ignoring out-of-zone data (veggie.com) 22: ignoring out-of-zone data (veggie.com) dns_rdata_fromtext: 23: near '2001:db8:': bad IPv6 address dns_rdata_fromtext: 24: near '1.2.3.': bad dotted quad dns_rdata_fromtext: 25: near '2001::db8::V32': bad IPv6 address "}</td> </tr> </tbody> </table>	SUCCESSFUL:	{"success":1,"message":"No errors found."}	ERROR:	{"success":0,"message":"21: ignoring out-of-zone data (veggie.com) 22: ignoring out-of-zone data (veggie.com) dns_rdata_fromtext: 23: near '2001:db8:': bad IPv6 address dns_rdata_fromtext: 24: near '1.2.3.': bad dotted quad dns_rdata_fromtext: 25: near '2001::db8::V32': bad IPv6 address "}				
SUCCESSFUL:	{"success":1,"message":"No errors found."}								
ERROR:	{"success":0,"message":"21: ignoring out-of-zone data (veggie.com) 22: ignoring out-of-zone data (veggie.com) dns_rdata_fromtext: 23: near '2001:db8:': bad IPv6 address dns_rdata_fromtext: 24: near '1.2.3.': bad dotted quad dns_rdata_fromtext: 25: near '2001::db8::V32': bad IPv6 address "}								
Required Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>zoneId</td> <td>INTEGER</td> <td>50</td> <td>The Id of the zone to check.</td> </tr> </tbody> </table>	Name	Type	Example	Description	zoneId	INTEGER	50	The Id of the zone to check.
Name	Type	Example	Description						
zoneId	INTEGER	50	The Id of the zone to check.						
Optional Parameters	None								
Example URL	/api/v1/api.php?target=zone&action=checkZone&zoneId=50								

getArchivedZone																																																					
URL	/api/v1/api.php?target=zone&action=getArchivedZone																																																				
Description	Searches for all archived versions of the a zone. Zones are archived every time changes are pushed to their DNS Server.																																																				
Returns	<p>Examples:</p> <table border="1"> <tr> <td>SUCCESSFUL:</td> <td>{ "success":1, "message":"Search Successful.", "data":{"zoneArchived": "2768", "zoneId": "1227", "zoneArchiveTimestamp": "1375298692", "zoneArchiveFingerprint": "d060e59d69606326d80b2e55b50f0bc9", "zoneName": "6connect.com", "zoneIpver": "nu", "zoneMask": null, "zoneSerial": "2013073105", "zoneRefresh": "14400", "zoneRetry": "2000", "zoneExpire": "604800", "zoneMinimum": "3600", "zoneSOA": null, "zoneTTL": "3600", "zoneEnableDNSSEC": "1", "zoneResourceId": "1013", "zonePreviousViewLinkage": ""}}</td> </tr> <tr> <td>ERROR:</td> <td>{ "success":0, "message":"error message"}</td> </tr> </table> <p>Data Detail:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>zoneId</td> <td>INTEGER</td> <td>The Id of the Zone entry to find archived versions of.</td> </tr> <tr> <td>zoneArchived</td> <td>INTEGER</td> <td>The ID of the Archive Entry</td> </tr> <tr> <td>zoneArchiveTimestamp</td> <td>INTEGER</td> <td>A timestamp marking when this zone was archived.</td> </tr> <tr> <td>zoneArchiveFingerprint</td> <td>STRING</td> <td>A hash value identifying this zone. Used for comparing versions.</td> </tr> <tr> <td>zoneName</td> <td>INTEGER</td> <td>Zone Name.</td> </tr> <tr> <td>zoneSerial</td> <td>INTEGER</td> <td>Zone Serial.</td> </tr> <tr> <td>zoneRefresh</td> <td>INTEGER</td> <td>Zone Refresh.</td> </tr> <tr> <td>zoneRetry</td> <td>INTEGER</td> <td>Zone Retry.</td> </tr> <tr> <td>zoneExpire</td> <td>INTEGER</td> <td>Zone Expire.</td> </tr> <tr> <td>zoneMinimum</td> <td>INTEGER</td> <td>Zone Minimum.</td> </tr> <tr> <td>zoneSOA</td> <td>STRING</td> <td>Zone SOA.</td> </tr> <tr> <td>zoneTTL</td> <td>INTEGER</td> <td>Zone TTL.</td> </tr> <tr> <td>zoneEnableDNSSEC</td> <td>STRING</td> <td>Whether or not this version had DNSSEC enabled.</td> </tr> <tr> <td>zoneResourceId</td> <td>STRING</td> <td>Zone Resource ID</td> </tr> <tr> <td>zonePreviousViewLinkage</td> <td>JSON</td> <td>A JSON-encoded array of views this zone was linked to.</td> </tr> </tbody> </table>	SUCCESSFUL:	{ "success":1, "message":"Search Successful.", "data":{"zoneArchived": "2768", "zoneId": "1227", "zoneArchiveTimestamp": "1375298692", "zoneArchiveFingerprint": "d060e59d69606326d80b2e55b50f0bc9", "zoneName": "6connect.com", "zoneIpver": "nu", "zoneMask": null, "zoneSerial": "2013073105", "zoneRefresh": "14400", "zoneRetry": "2000", "zoneExpire": "604800", "zoneMinimum": "3600", "zoneSOA": null, "zoneTTL": "3600", "zoneEnableDNSSEC": "1", "zoneResourceId": "1013", "zonePreviousViewLinkage": ""}}	ERROR:	{ "success":0, "message":"error message"}	Name	Type	Description	zoneId	INTEGER	The Id of the Zone entry to find archived versions of.	zoneArchived	INTEGER	The ID of the Archive Entry	zoneArchiveTimestamp	INTEGER	A timestamp marking when this zone was archived.	zoneArchiveFingerprint	STRING	A hash value identifying this zone. ERROR:	{ "success":0, "message":"error message" }																												
Name	Type	Description																											
recordId	INTEGER	The ID of this Record Entry. It is always included with its parent Zone.																											
recordZoneId	INTEGER	The ID of this Record's parent Zone.																											
recordHost	STRING	The Hostname of this Record.																											
recordType	STRING	The Record Type (MX,NS,A,PTR,etc)																											
recordValue	STRING	The Value of this Record.																											
recordDescription	STRING	A short description of this Record.																											
recordTTL	STRING	The TTL of this Record.																											
Required Parameters	None																												

Optional Parameters

Name	Type	Example	Description
likeFlag	BOOL	1	When 1, string searches are done via LIKE with wildcards at both ends. When 0, strict comp
selectCount	INTEGER	30	When supplied only returns the first X entries
selectOffset	INTEGER	10	When supplied, only returns entries after record X

Name	Type	Example	Description
recordId	INTEGER	123	The Record ID to search for.
recordZoneId	INTEGER	123	The parent Zone to search for.
recordHost	STRING	@	The Record Host to search for.
recordType	STRING	NS	The Record Type to search for.
recordValue	STRING	ns1.dns.6connect.com.	The Record Value to search for.
recordDescription	STRING	Description	Search based on Record Description.
recordTTL	STRING	3600	The Record TTL to search for.

Name	Type	Example	Description
zoneId	INTEGER	123	The Zone Id to search for.
zoneName	STRING	foo	The Zone Name to search for.
zoneResourceId	INTEGER	5	The Resource Id to search for.
zoneCustName	STRING	foo	The Customer Name to search for.
zoneIpver	STRING	IPv6	The IP Version to search for.
zoneSerial	INTEGER	2012033001	The Zone Serial to search for.
zoneRefresh	INTEGER	36000	The Zone Refresh to search for.
zoneRetry	INTEGER	800	The Zone Retry to search for.
zoneExpire	INTEGER	6090000	The Zone Expire to search for.
zoneMinimum	INTEGER	10	The Zone Minimum to search for.
zoneSOA	STRING	200	The Zone SOA to search for.
zoneTTL	INTEGER	3600	The Zone TTL to search for.
zoneEnableDNSSEC	INTEGER	1	Search based on DNSSEC settings.

Example URL

/api/v1/api.php?target=record&action=get&selectCount=30&zoneId=123

update

URL

/api/v1/api.php?target=record&action=update

Description

First performs a search based on the submitted Zone and Record criteria, then performs an Update across those entries based on new values.

Returns	Examples: <table border="1"> <tr> <td>SUCCESSFUL:</td> <td>{ "success":1, "message":"Update Successful." }</td> </tr> <tr> <td>ERROR:</td> <td>{ "success":0, "message":"error message" }</td> </tr> </table>				SUCCESSFUL:	{ "success":1, "message":"Update Successful." }	ERROR:	{ "success":0, "message":"error message" }																																																																																								
SUCCESSFUL:	{ "success":1, "message":"Update Successful." }																																																																																															
ERROR:	{ "success":0, "message":"error message" }																																																																																															
Required Parameters	None																																																																																															
Optional Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>likeFlag</td> <td>BOOL</td> <td>1</td> <td>When 1, string searches are done via LIKE with wildcards at both ends. When 0, strict comparison is used.</td> </tr> <tr> <td>generalFlag</td> <td>BOOL</td> <td>1</td> <td>When 1, searches over the provided parameters using OR. If 0 or omitted, uses AND.</td> </tr> </tbody> </table> <table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>searchZoneId</td> <td>INTEGER</td> <td>123</td> <td>The Zone ID to search for.</td> </tr> <tr> <td>searchZoneName</td> <td>STRING</td> <td>foo</td> <td>The Zone Name to search for.</td> </tr> <tr> <td>searchZoneCustId</td> <td>INTEGER</td> <td>5</td> <td>The Customer ID to search for.</td> </tr> <tr> <td>searchZoneSerial</td> <td>INTEGER</td> <td>2012033001</td> <td>The Zone Serial to search for.</td> </tr> <tr> <td>searchZoneRefresh</td> <td>INTEGER</td> <td>36000</td> <td>The Zone Refresh to search for.</td> </tr> <tr> <td>searchZoneRetry</td> <td>INTEGER</td> <td>800</td> <td>The Zone Retry to search for.</td> </tr> <tr> <td>searchZoneExpire</td> <td>INTEGER</td> <td>6090000</td> <td>The Zone Expire to search for.</td> </tr> <tr> <td>searchZoneMinimum</td> <td>INTEGER</td> <td>10</td> <td>The Zone Minimum to search for.</td> </tr> <tr> <td>searchZoneSOA</td> <td>STRING</td> <td>200</td> <td>The Zone SOA to search for.</td> </tr> <tr> <td>searchZoneTTL</td> <td>INTEGER</td> <td>3600</td> <td>The Zone TTL to search for.</td> </tr> <tr> <td>searchZoneEnableDNSSEC</td> <td>INTEGER</td> <td>1</td> <td>Search based on DNSSEC settings.</td> </tr> <tr> <td>searchRecordId</td> <td>INTEGER</td> <td>123</td> <td>The Record ID to search for.</td> </tr> <tr> <td>searchRecordHost</td> <td>STRING</td> <td>@</td> <td>The Record Host to search for.</td> </tr> <tr> <td>searchRecordType</td> <td>STRING</td> <td>NS</td> <td>The Record Type to search for.</td> </tr> <tr> <td>searchRecordValue</td> <td>STRING</td> <td>ns1.dns.6connect.com.</td> <td>The Record Value to search for.</td> </tr> <tr> <td>searchRecordDescription</td> <td>STRING</td> <td>Description</td> <td>Search based on Record Description.</td> </tr> <tr> <td>searchRecordTTL</td> <td>STRING</td> <td>3600</td> <td>The Record TTL to search for.</td> </tr> <tr> <td>searchZoneResourceId</td> <td>INTEGER</td> <td>5</td> <td>The Resource Id to search for.</td> </tr> <tr> <td>searchRecordZoneId</td> <td>INTEGER</td> <td>123</td> <td>The Zone ID of the Record to search for.</td> </tr> </tbody> </table>				Name	Type	Example	Description	likeFlag	BOOL	1	When 1, string searches are done via LIKE with wildcards at both ends. When 0, strict comparison is used.	generalFlag	BOOL	1	When 1, searches over the provided parameters using OR. If 0 or omitted, uses AND.	Name	Type	Example	Description	searchZoneId	INTEGER	123	The Zone ID to search for.	searchZoneName	STRING	foo	The Zone Name to search for.	searchZoneCustId	INTEGER	5	The Customer ID to search for.	searchZoneSerial	INTEGER	2012033001	The Zone Serial to search for.	searchZoneRefresh	INTEGER	36000	The Zone Refresh to search for.	searchZoneRetry	INTEGER	800	The Zone Retry to search for.	searchZoneExpire	INTEGER	6090000	The Zone Expire to search for.	searchZoneMinimum	INTEGER	10	The Zone Minimum to search for.	searchZoneSOA	STRING	200	The Zone SOA to search for.	searchZoneTTL	INTEGER	3600	The Zone TTL to search for.	searchZoneEnableDNSSEC	INTEGER	1	Search based on DNSSEC settings.	searchRecordId	INTEGER	123	The Record ID to search for.	searchRecordHost	STRING	@	The Record Host to search for.	searchRecordType	STRING	NS	The Record Type to search for.	searchRecordValue	STRING	ns1.dns.6connect.com.	The Record Value to search for.	searchRecordDescription	STRING	Description	Search based on Record Description.	searchRecordTTL	STRING	3600	The Record TTL to search for.	searchZoneResourceId	INTEGER	5	The Resource Id to search for.	searchRecordZoneId	INTEGER	123	The Zone ID of the Record to search for.
Name	Type	Example	Description																																																																																													
likeFlag	BOOL	1	When 1, string searches are done via LIKE with wildcards at both ends. When 0, strict comparison is used.																																																																																													
generalFlag	BOOL	1	When 1, searches over the provided parameters using OR. If 0 or omitted, uses AND.																																																																																													
Name	Type	Example	Description																																																																																													
searchZoneId	INTEGER	123	The Zone ID to search for.																																																																																													
searchZoneName	STRING	foo	The Zone Name to search for.																																																																																													
searchZoneCustId	INTEGER	5	The Customer ID to search for.																																																																																													
searchZoneSerial	INTEGER	2012033001	The Zone Serial to search for.																																																																																													
searchZoneRefresh	INTEGER	36000	The Zone Refresh to search for.																																																																																													
searchZoneRetry	INTEGER	800	The Zone Retry to search for.																																																																																													
searchZoneExpire	INTEGER	6090000	The Zone Expire to search for.																																																																																													
searchZoneMinimum	INTEGER	10	The Zone Minimum to search for.																																																																																													
searchZoneSOA	STRING	200	The Zone SOA to search for.																																																																																													
searchZoneTTL	INTEGER	3600	The Zone TTL to search for.																																																																																													
searchZoneEnableDNSSEC	INTEGER	1	Search based on DNSSEC settings.																																																																																													
searchRecordId	INTEGER	123	The Record ID to search for.																																																																																													
searchRecordHost	STRING	@	The Record Host to search for.																																																																																													
searchRecordType	STRING	NS	The Record Type to search for.																																																																																													
searchRecordValue	STRING	ns1.dns.6connect.com.	The Record Value to search for.																																																																																													
searchRecordDescription	STRING	Description	Search based on Record Description.																																																																																													
searchRecordTTL	STRING	3600	The Record TTL to search for.																																																																																													
searchZoneResourceId	INTEGER	5	The Resource Id to search for.																																																																																													
searchRecordZoneId	INTEGER	123	The Zone ID of the Record to search for.																																																																																													

Name	Type	Example	Description
updateZoneName	STRING	foo	The Zone name to replace into the searched rows.
updateZoneSerial	INTEGER	2012033001	The Zone Serial to replace into the searched rows.
updateZoneRefresh	INTEGER	36000	The Zone Refresh to replace into the searched rows.
updateZoneRetry	INTEGER	800	The Zone Retry to replace into the searched rows..
updateZoneExpire	INTEGER	6090000	The Zone Expire to replace into the searched rows.
updateZoneMinimum	INTEGER	10	The Zone Minimum to replace into the searched rows.
updateZoneSOA	STRING	200	The Zone SOA to replace into the searched rows.
updateZoneTTL	INTEGER	3600	The Zone TTL to replace into the searched rows.
updateZoneEnableDNSSEC	INTEGER	1	Update DNSSEC Settings.
updateRecordHost	STRING	@	The Record Host to replace into the searched rows.
updateRecordType	STRING	NS	The Record Type to replace into the searched rows.
updateRecordValue	STRING	ns1.dns.6connect.com.	The Record Value to replace into the searched rows.
updateRecordDescription	STRING	Description	Update Record Descriptions.
updateRecordTTL	STRING	3600	The Record TTL to replace into the searched rows.
updateZoneResourceId	INTEGER	5	The Resource Id to replace into the searched rows.
updateZoneAutoCheck	BOOL	1	Whether or not this zone is configured to be automatically validated on load/edit.

Example URL /api/v1/api.php?target=record&action=update&searchZoneId=123&updateZoneTTL=3600

add

URL /api/v1/api.php?target=record&action=add

Description Adds a new Record to a supplied Zone.

Returns

Examples:

SUCCESSFUL:	{"success":1,"message":"Add Successful.,"data":123}
ERROR:	{"success":0, "message":"error message"}

Data Detail:

Name	Type	Description
data	INTEGER	The ID of the new Record entry.

Required Parameters

Name	Type	Example	Description
newRecordZoneId	INTEGER	123	The Zone ID of the new Record.
newRecordHost	STRING	@	New Host Name.
newRecordType	STRING	PTR	New Record Type.
newRecordValue*	STRING	123	New Record Value.
*newRecordValue required only for certain Record Types			

Optional Parameters	Name	Type	Example	Description
	likeFlag	BOOL	1	When 1, string searches are done via LIKE with wildcards at both ends. When 0, strict comparison is used.
	newRecordDescription	STRING	Description.	Notes for the Record.
	newRecordTTL	INTEGER	3600	Record TTL.
Example URL	/api/v1/api.php?target=record&action=add&newRecordZoneId=123&newRecordHost=@host&newRecordType=PTR&newRecordTTL=3600			

delete					
URL	/api/v1/api.php?target=record&action=delete				
Description	Performs a search over the Zones and Records dataset and deletes all found Records, but leaves their parent Zones intact.				
Returns	<p>Examples:</p> <table border="1"> <tr> <td>SUCCESSFUL:</td> <td>{"success":1,"message":"Deletion Successful."}</td> </tr> <tr> <td>ERROR:</td> <td>{"success":0,"message":"error message"}</td> </tr> </table>	SUCCESSFUL:	{"success":1,"message":"Deletion Successful."}	ERROR:	{"success":0,"message":"error message"}
SUCCESSFUL:	{"success":1,"message":"Deletion Successful."}				
ERROR:	{"success":0,"message":"error message"}				
Required Parameters	None				

Optional Parameters	Name	Type	Example	Description
	deleteZoneId	INTEGER	123	The Zone ID to search for.
	deleteZoneName	STRING	foo	The Zone Name to search for.
	deleteZoneCustId	INTEGER	5	The Customer ID to search for.
	deleteZoneIpver	STRING	IPv6	The IP Version to search for.
	deleteZoneSerial	INTEGER	2012033001	The Zone Serial to search for.
	deleteZoneRefresh	INTEGER	36000	The Zone Refresh to search for.
	deleteZoneRetry	INTEGER	800	The Zone Retry to search for.
	deleteZoneExpire	INTEGER	6090000	The Zone Expire to search for.
	deleteZoneMinimum	INTEGER	10	The Zone Minimum to search for.
	deleteZoneSOA	STRING	200	The Zone SOA to search for.
	deleteZoneTTL	INTEGER	3600	The Zone TTL to search for.
	deleteZoneEnableDNSSEC	INTEGER	1	Search based on DNSSEC settings.
	deleteRecordId	INTEGER	123	The Record ID to search for.
	deleteRecordHost	STRING	@	The Record Host to search for.
	deleteRecordType	STRING	NS	The Record Type to search for.
	deleteRecordValue	STRING	ns1.dns.6connect.com.	The Record Value to search for.
	deleteRecordDescription	STRING	Description	Search based on Record Description.
	deleteRecordTTL	STRING	3600	The Record TTL to search for.
	deleteZoneResourceId	INTEGER	5	The Resource Id to search for.
deleteZoneCustName	STRING	foo	The Customer Name to search for.	
Example URL	/api/v1/api.php?target=record&action=delete&deleteZoneName=foo			

switch																
URL	/api/v1/api.php?target=record&action=switch															
Description	Switches the order of two record entries.															
Returns	Examples: <table border="1"> <tr> <td>SUCCESSFUL:</td> <td>{"success":1,"message":"Record Moved."}</td> </tr> <tr> <td>ERROR:</td> <td>{"success":0,"message":"error message"}</td> </tr> </table>				SUCCESSFUL:	{"success":1,"message":"Record Moved."}	ERROR:	{"success":0,"message":"error message"}								
SUCCESSFUL:	{"success":1,"message":"Record Moved."}															
ERROR:	{"success":0,"message":"error message"}															
Required Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>moveWhichId</td> <td>INTEGER</td> <td>123</td> <td>The Record Id to be moved.</td> </tr> <tr> <td>moveAfterId</td> <td>INTEGER</td> <td>42</td> <td>The Id of the Record the first Record is to be moved after.</td> </tr> </tbody> </table>				Name	Type	Example	Description	moveWhichId	INTEGER	123	The Record Id to be moved.	moveAfterId	INTEGER	42	The Id of the Record the first Record is to be moved after.
Name	Type	Example	Description													
moveWhichId	INTEGER	123	The Record Id to be moved.													
moveAfterId	INTEGER	42	The Id of the Record the first Record is to be moved after.													
Optional Parameters	None															
Example URL	/api/v1/api.php?target=record&action=switch&moveWhichId=123&moveAfterId=42															

Server-Zone Linkage

get																																
URL	/api/v1/api.php?target=zoneLinkage&action=get																															
Description	Searches for Server-Zone Linkages. If no search parameters are supplied, all linkages are returned.																															
Returns	<p>Examples:</p> <table border="1"> <tr> <td>SUCCESSFUL:</td> <td>{ "success":1, "message":"2 rows retrieved.", "data":[{"id":"285", "zoneld":"64", "serverId":"1", "serverName":"173.164.182.169", "serverType":"SCP", "serverMasterType": "slave", "zoneName": "zone1", "resourceId": "1"}]}</td> </tr> <tr> <td>ERROR:</td> <td>{ "success":0, "message":"error message"}</td> </tr> </table> <p>Data Detail:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>id</td> <td>INTEGER</td> <td>The Linkage Id.</td> </tr> <tr> <td>zoneld</td> <td>INTEGER</td> <td>The Zoneld involved in this link.</td> </tr> <tr> <td>serverId</td> <td>INTEGER</td> <td>The ServerId involved in this link.</td> </tr> <tr> <td>serverName</td> <td>STRING</td> <td>The server name</td> </tr> <tr> <td>serverType</td> <td>STRING</td> <td>The server transfer type</td> </tr> <tr> <td>serverMasterType</td> <td>STRING</td> <td>Whether this server is a master or a slave.</td> </tr> <tr> <td>zoneName</td> <td>STRING</td> <td>The zone name</td> </tr> <tr> <td>resourceId</td> <td>INTEGER</td> <td>The Resource Id the Zone is attached to.</td> </tr> </tbody> </table>	SUCCESSFUL:	{ "success":1, "message":"2 rows retrieved.", "data":[{"id":"285", "zoneld":"64", "serverId":"1", "serverName":"173.164.182.169", "serverType":"SCP", "serverMasterType": "slave", "zoneName": "zone1", "resourceId": "1"}]}	ERROR:	{ "success":0, "message":"error message"}	Name	Type	Description	id	INTEGER	The Linkage Id.	zoneld	INTEGER	The Zoneld involved in this link.	serverId	INTEGER	The ServerId involved in this link.	serverName	STRING	The server name	serverType	STRING	The server transfer type	serverMasterType	STRING	Whether this server is a master or a slave.	zoneName	STRING	The zone name	resourceId	INTEGER	The Resource Id the Zone is attached to.
SUCCESSFUL:	{ "success":1, "message":"2 rows retrieved.", "data":[{"id":"285", "zoneld":"64", "serverId":"1", "serverName":"173.164.182.169", "serverType":"SCP", "serverMasterType": "slave", "zoneName": "zone1", "resourceId": "1"}]}																															
ERROR:	{ "success":0, "message":"error message"}																															
Name	Type	Description																														
id	INTEGER	The Linkage Id.																														
zoneld	INTEGER	The Zoneld involved in this link.																														
serverId	INTEGER	The ServerId involved in this link.																														
serverName	STRING	The server name																														
serverType	STRING	The server transfer type																														
serverMasterType	STRING	Whether this server is a master or a slave.																														
zoneName	STRING	The zone name																														
resourceId	INTEGER	The Resource Id the Zone is attached to.																														
Required Parameters	None																															
Optional Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>id</td> <td>INTEGER</td> <td>15</td> <td>Fetches the linkage with the matching id.</td> </tr> <tr> <td>serverId</td> <td>INTEGER</td> <td>15</td> <td>Fetches all linkages with the matching serverId.</td> </tr> <tr> <td>zoneld</td> <td>INTEGER</td> <td>15</td> <td>Fetches all linkages with the matching zoneld.</td> </tr> </tbody> </table>	Name	Type	Example	Description	id	INTEGER	15	Fetches the linkage with the matching id.	serverId	INTEGER	15	Fetches all linkages with the matching serverId.	zoneld	INTEGER	15	Fetches all linkages with the matching zoneld.															
Name	Type	Example	Description																													
id	INTEGER	15	Fetches the linkage with the matching id.																													
serverId	INTEGER	15	Fetches all linkages with the matching serverId.																													
zoneld	INTEGER	15	Fetches all linkages with the matching zoneld.																													
Example URL	/api/v1/api.php?target=zoneLinkage&action=get&id=15																															

add					
URL	/api/v1/api.php?target=zoneLinkage&action=add				
Description	Adds a new link between a DNS Server and a Zone				
Returns	<p>Examples:</p> <table border="1"> <tr> <td>SUCCESSFUL:</td> <td>{ "success":1, "message":"Link Added."}</td> </tr> <tr> <td>ERROR:</td> <td>{ "success":0, "message":"error message"}</td> </tr> </table>	SUCCESSFUL:	{ "success":1, "message":"Link Added."}	ERROR:	{ "success":0, "message":"error message"}
SUCCESSFUL:	{ "success":1, "message":"Link Added."}				
ERROR:	{ "success":0, "message":"error message"}				

Required Parameters	Name	Type	Example	Description
	serverId	INTEGER	16	The DNS Server Id.
	zoneId	INTEGER	105	The Zone Id.
	serverSlave	BOOL	1	Whether or not this zone is a master or a slave on the linked server. Values are: 1 for slave, 0 for master.
Optional Parameters	None			
Example URL	/api/v1/api.php?target=zoneLinkage&action=add&serverId=16&zoneId=105&serverSlave=0			

delete																	
URL	/api/v1/api.php?target=zoneLinkage&action=delete																
Description	Deletes a link between a DNS Server and a Zone																
Returns	<p>Examples:</p> <table border="1"> <tr> <td>SUCCESSFUL:</td> <td>{"success":1,"message":"Link Deleted."}</td> </tr> <tr> <td>ERROR:</td> <td>{"success":0, "message":"error message"}</td> </tr> </table>	SUCCESSFUL:	{"success":1,"message":"Link Deleted."}	ERROR:	{"success":0, "message":"error message"}												
SUCCESSFUL:	{"success":1,"message":"Link Deleted."}																
ERROR:	{"success":0, "message":"error message"}																
Required Parameters	None																
Optional Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>id</td> <td>INTEGER</td> <td>15</td> <td>Fetches the linkage with the matching id.</td> </tr> <tr> <td>serverId</td> <td>INTEGER</td> <td>15</td> <td>Fetches all linkages with the matching serverId.</td> </tr> <tr> <td>zoneId</td> <td>INTEGER</td> <td>15</td> <td>Fetches all linkages with the matching zoneId.</td> </tr> </tbody> </table>	Name	Type	Example	Description	id	INTEGER	15	Fetches the linkage with the matching id.	serverId	INTEGER	15	Fetches all linkages with the matching serverId.	zoneId	INTEGER	15	Fetches all linkages with the matching zoneId.
Name	Type	Example	Description														
id	INTEGER	15	Fetches the linkage with the matching id.														
serverId	INTEGER	15	Fetches all linkages with the matching serverId.														
zoneId	INTEGER	15	Fetches all linkages with the matching zoneId.														
Example URL	/api/v1/api.php?target=zoneLinkage&action=delete																

Name Server Control

get	
URL	/api/v1/api.php?target=nameServer&action=get
Description	Fetches a list of all stored Name Servers

Returns	<p>Examples:</p> <table border="1"> <tr> <td>SUCCESSFUL:</td> <td><code>{"success":1,"message":"Fetch Successful","data":{"id":"1","nameserver":"ns1.dns.6connect.net","add_to_zones_default":"1","ordering":"10","uses":1}}</code></td> </tr> <tr> <td>ERROR:</td> <td><code>{"success":0,"message":"error message"}</code></td> </tr> </table> <p>Data Detail:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>id</td> <td>INTEGER</td> <td>Server ID</td> </tr> <tr> <td>nameserver</td> <td>STRING</td> <td>Server Name</td> </tr> <tr> <td>add_to_zones_default</td> <td>BOOL</td> <td>Whether or not this is a default server.</td> </tr> <tr> <td>ordering</td> <td>INTEGER</td> <td>Display order</td> </tr> <tr> <td>uses</td> <td>INTEGER</td> <td>How many zones have been assigned to this NameServer</td> </tr> </tbody> </table>	SUCCESSFUL:	<code>{"success":1,"message":"Fetch Successful","data":{"id":"1","nameserver":"ns1.dns.6connect.net","add_to_zones_default":"1","ordering":"10","uses":1}}</code>	ERROR:	<code>{"success":0,"message":"error message"}</code>	Name	Type	Description	id	INTEGER	Server ID	nameserver	STRING	Server Name	add_to_zones_default	BOOL	Whether or not this is a default server.	ordering	INTEGER	Display order	uses	INTEGER	How many zones have been assigned to this NameServer
SUCCESSFUL:	<code>{"success":1,"message":"Fetch Successful","data":{"id":"1","nameserver":"ns1.dns.6connect.net","add_to_zones_default":"1","ordering":"10","uses":1}}</code>																						
ERROR:	<code>{"success":0,"message":"error message"}</code>																						
Name	Type	Description																					
id	INTEGER	Server ID																					
nameserver	STRING	Server Name																					
add_to_zones_default	BOOL	Whether or not this is a default server.																					
ordering	INTEGER	Display order																					
uses	INTEGER	How many zones have been assigned to this NameServer																					
Required Parameters	None																						
Optional Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>default</td> <td>INTEGER</td> <td>1</td> <td>Set server as default</td> </tr> </tbody> </table>	Name	Type	Example	Description	default	INTEGER	1	Set server as default														
Name	Type	Example	Description																				
default	INTEGER	1	Set server as default																				
Example URL	/api/v1/api.php?target=nameServer&action=get&default=1																						

add									
URL	/api/v1/api.php?target=nameServer&action=add								
Description	Adds a new DNS Server								
Returns	<p>Examples:</p> <table border="1"> <tr> <td>SUCCESSFUL:</td> <td><code>{"success":1,"message":"Add Successful."}</code></td> </tr> <tr> <td>ERROR:</td> <td><code>{"success":0,"message":"error message"}</code></td> </tr> </table>	SUCCESSFUL:	<code>{"success":1,"message":"Add Successful."}</code>	ERROR:	<code>{"success":0,"message":"error message"}</code>				
SUCCESSFUL:	<code>{"success":1,"message":"Add Successful."}</code>								
ERROR:	<code>{"success":0,"message":"error message"}</code>								
Required Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>newServer</td> <td>STRING</td> <td>ns.yourdomain.com</td> <td>Name of the NameServer</td> </tr> </tbody> </table>	Name	Type	Example	Description	newServer	STRING	ns.yourdomain.com	Name of the NameServer
Name	Type	Example	Description						
newServer	STRING	ns.yourdomain.com	Name of the NameServer						
Optional Parameters	None								
Example URL	/api/v1/api.php?target=nameServer&action=add&newServer=ns.yourdomain.com								

delete	
URL	/api/v1/api.php?target=nameServer&action=delete
Description	Deletes a NameServer

Returns	Examples: <table border="1"> <tr> <td>SUCCESSFUL:</td> <td><code>{"success":1,"message":"Server Deleted."}</code></td> </tr> <tr> <td>ERROR:</td> <td><code>{"success":0,"message":"error message"}</code></td> </tr> </table>	SUCCESSFUL:	<code>{"success":1,"message":"Server Deleted."}</code>	ERROR:	<code>{"success":0,"message":"error message"}</code>				
SUCCESSFUL:	<code>{"success":1,"message":"Server Deleted."}</code>								
ERROR:	<code>{"success":0,"message":"error message"}</code>								
Required Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>id</td> <td>INTEGER</td> <td>5</td> <td>ID of server to delete.</td> </tr> </tbody> </table>	Name	Type	Example	Description	id	INTEGER	5	ID of server to delete.
Name	Type	Example	Description						
id	INTEGER	5	ID of server to delete.						
Optional Parameters	None								
Example URL	/api/v1/api.php?target=nameServer&action=delete&id=5								

setDefault													
URL	/api/v1/api.php?target=nameServer&action=setDefault												
Description	Default NameServers have all new zones added to them as they are created. Multiple NameServers can be classified as Default.												
Returns	Examples: <table border="1"> <tr> <td>SUCCESSFUL:</td> <td><code>{"success":1,"message":"Success."}</code></td> </tr> <tr> <td>ERROR:</td> <td><code>{"success":0,"message":"error message"}</code></td> </tr> </table>	SUCCESSFUL:	<code>{"success":1,"message":"Success."}</code>	ERROR:	<code>{"success":0,"message":"error message"}</code>								
SUCCESSFUL:	<code>{"success":1,"message":"Success."}</code>												
ERROR:	<code>{"success":0,"message":"error message"}</code>												
Required Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>id</td> <td>INTEGER</td> <td>5</td> <td>ID of server to modify.</td> </tr> <tr> <td>value</td> <td>INTEGER</td> <td>1</td> <td>1 = Default, 0 = Normal</td> </tr> </tbody> </table>	Name	Type	Example	Description	id	INTEGER	5	ID of server to modify.	value	INTEGER	1	1 = Default, 0 = Normal
Name	Type	Example	Description										
id	INTEGER	5	ID of server to modify.										
value	INTEGER	1	1 = Default, 0 = Normal										
Optional Parameters	None												
Example URL	/api/v1/api.php?target=nameServer&action=setDefault&id=3&value=1												

orderUp									
URL	/api/v1/api.php?target=nameServer&action=orderUp								
Description	Swaps the index order of the targeted NameServer with that of the one above it.								
Returns	Examples: <table border="1"> <tr> <td>SUCCESSFUL:</td> <td><code>{"success":1,"message":"Reordering Successful."}</code></td> </tr> <tr> <td>ERROR:</td> <td><code>{"success":0,"message":"error message"}</code></td> </tr> </table>	SUCCESSFUL:	<code>{"success":1,"message":"Reordering Successful."}</code>	ERROR:	<code>{"success":0,"message":"error message"}</code>				
SUCCESSFUL:	<code>{"success":1,"message":"Reordering Successful."}</code>								
ERROR:	<code>{"success":0,"message":"error message"}</code>								
Required Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>id</td> <td>INTEGER</td> <td>5</td> <td>ID of server to modify.</td> </tr> </tbody> </table>	Name	Type	Example	Description	id	INTEGER	5	ID of server to modify.
Name	Type	Example	Description						
id	INTEGER	5	ID of server to modify.						
Optional Parameters	None								
Example URL	/api/v1/api.php?target=nameServer&action=orderUp&id=3								

orderDown									
URL	/api/v1/api.php?target=nameServer&action=orderDown								
Description	Swaps the index order of the targeted NameServer with that of the one below it.								
Returns	<p>Examples:</p> <table border="1"> <tr> <td>SUCCESSFUL:</td> <td><code>{"success":1,"message":"Reordering Successful."}</code></td> </tr> <tr> <td>ERROR:</td> <td><code>{"success":0, "message":"error message"}</code></td> </tr> </table>	SUCCESSFUL:	<code>{"success":1,"message":"Reordering Successful."}</code>	ERROR:	<code>{"success":0, "message":"error message"}</code>				
SUCCESSFUL:	<code>{"success":1,"message":"Reordering Successful."}</code>								
ERROR:	<code>{"success":0, "message":"error message"}</code>								
Required Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>id</td> <td>INTEGER</td> <td>5</td> <td>ID of server to activate.</td> </tr> </tbody> </table>	Name	Type	Example	Description	id	INTEGER	5	ID of server to activate.
Name	Type	Example	Description						
id	INTEGER	5	ID of server to activate.						
Optional Parameters	None								
Example URL	/api/v1/api.php?target=nameServer&action=orderDown&id=5								

API Module - IPAM

- IP Address Management (IPv4 and IPv6)
 - Get
 - Add
 - Update
 - Delete
 - Add Tag
 - Delete Tag
 - Smart Assign
 - Direct Assign
 - Unassign
 - Get Tags List
 - Add Tag To List
 - Get Regions List
 - Add Region To List
 - Get Utilization
 - Get Host Utilization
 - Aggregate
 - Split
 - Scan Block
 - Get Scan Results
 - Get Options
 - Get VLAN
 - Process Holding Tank
 - Mask Report
- IPAM SWIP Calls:
 - Deassign
 - Get RIR List
 - Simple Reassign
 - Get Attribute List

IP Address Management (IPv4 and IPv6)

Get													
URL	/api/v1/api.php?target=ipam&action=get												
Description	Returns a list of IP blocks. Use optional parameters to filter the list. If multiple parameters are specified, only blocks matching all parameters will be returned.												
Returns	<p>Examples:</p> <table border="1"> <tr> <td>SUCCESSFUL</td> <td><pre>{ "success": 1, "message": "1 blocks found. ", "data": [{ "id": 5890, "type": "ipv4", "top_aggregate": null, "cidr": "192.168.0.0V24", "formatted_ip": "192.168.0.0V24", "address": "3232235520", "end_address": "3232235775", "mask": 24, "child1": null, "child2": null, "is_assigned": 0, "is_swipped": 0, "is_aggregate": 1, "custid": 81, "resource_id": 81, "resource_name": "Available", "last_updated_time": null, "description": null, "parent": null, "rir": "1918", "lir_id": null, "notes": null, "generic_code": null, "code": null, "region": "SFO", "vlan": 100, "arin_net_id": null, "arin_cust_id": null, "org_id": null, "arin_swip_time": null, "assigned_time": null, "asn": null, "allowSubAssignments": false, "permissions": { "permissionIPAMRead": "1", "permissionIPAMUpdate": "1", "permissionIPAMCreate": "1", "permissionSWIP": "1", "permissionAdmin": "1" }, "range": "192.168.0.0 - 192.168.0.255", "tags": ["Customer", "PTP"] }] }</pre></td> </tr> <tr> <td>ERROR</td> <td><pre>{'success':0, 'message':'error message'}</pre></td> </tr> </table>	SUCCESSFUL	<pre>{ "success": 1, "message": "1 blocks found. SUCCESSFUL	<pre>{ "success": 1, "message": "1 blocks found. ", "data": [{ "id": 5890, "type": "ipv4", "top_aggregate": null, "cidr": "192.168.0.0V24", "formatted_ip": "192.168.0.0V24", "address": "3232235520", "end_address": "3232235775", "mask": 24, "child1": null, "child2": null, "is_assigned": 0, "is_swipped": 0, "is_aggregate": 1, "custid": 81, "resource_id": 81, "resource_name": "Available", "last_updated_time": null, "description": null, "parent": null, "rir": "1918", "lir_id": null, "notes": null, "generic_code": null, "code": null, "region": "SFO", "vlan": 100, "arin_net_id": null, "arin_cust_id": null, "org_id": null, "arin_swip_time": null, "assigned_time": null, "asn": null, "allowSubAssignments": false, "permissions": { "permissionIPAMRead": "1", "permissionIPAMUpdate": "1", "permissionIPAMCreate": "1", "permissionSWIP": "1", "permissionAdmin": "1" }, "range": "192.168.0.0 - 192.168.0.255", "tags": ["Customer", "PTP"] }] }</pre>												
ERROR	<pre>{'success':0, 'message':'error message'}</pre>												
Required Parameters	None												
Optional Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>address</td> <td>INTEGER</td> <td>1125449728</td> <td>IP address of the block in decimal format</td> </tr> <tr> <td>asn</td> <td>INTEGER</td> <td>1000</td> <td>Filters blocks based on their ASN</td> </tr> </tbody> </table>	Name	Type	Example	Description	address	INTEGER	1125449728	IP address of the block in decimal format	asn	INTEGER	1000	Filters blocks based on their ASN
Name	Type	Example	Description										
address	INTEGER	1125449728	IP address of the block in decimal format										
asn	INTEGER	1000	Filters blocks based on their ASN										

allowSubAssignments	BOOL	true	Filters blocks based on whether they allow sub-assignments or not. Acceptable values: "true" or "false"
block	STRING	213.37.29.0/24	CIDR block description
code	STRING	Code X	User-defined block code as defined in Admin-IPAM settings: Generic Code Per Block Name
endAddress	INTEGER	1125453823	End IP address of the block in decimal format
id	INTEGER	1234	The ID of the block
includeAttributes	BOOL	true	Allows loading and display of the attributes for all of the blocks in the collection.
isAggregate	BOOL	true	Indicates if the block has been split into children or not. A value of 'true' will return blocks with no children.
isAssigned	BOOL	true	Acceptable values: "true" or "false"
isSwipped	BOOL	true	Acceptable values: "true" or "false"
lastUpdateTime	DATETIME	=2015-8-19 21:08:54	SQL Datetime format, prefaced by an "=" for exact time updated, "=>" for blocks updated after the given time, or "=<" for blocks updated before the given time.
lirId	INTEGER	101	The numeric ID of an LIR resource the block should be linked to
mask	INTEGER	24	Integer bitmask
notes	STRING	note123	Returns blocks with exact matches in the notes field against the provided "notes" string.
region	STRING	SFO	The value from the list of name/value pairs which make up the list of available regions
resourceHolderId	STRING	cust-001	(Deprecated): Use resourceQuery instead) A custom ID which can be used to link resources in the 6Connect database back to your organization.
resourceId	INTEGER	1234	The ID of the resource the block is assigned to
resourceQuery	JSON	{"parent_id":15}	A JSON object representing a valid resource query. Any parameters that can be used for a Resource GET API call can be used. Use of the resourceQuery parameter will return blocks assigned to any of the resources returned by that query.
rir	STRING	ARIN	Acceptable values: ARIN, RIPE, APNIC, AfriNIC, LACNIC, 1918
search	STRING	192.168	If a search term is provided, all IPAM fields including assigned Resource Holder name will be checked with a LIKE comparison to find matching blocks
selectCount	INTEGER	50	# of blocks to get
selectOffset	INTEGER	25	Offset for results set; useful for paging (e.g. selectCount = 50, selectOffset = 100 would return the 3rd page of 50 results)
sortField	STRING	cidr	Attribute to sort blocks by. Acceptable values: cidr, mask, rir, vlan, code, updateTime
sortOrder	INTEGER	ASC	ASC or DESC
tags	STRING	customer,vpn	Comma-separated list of tags to filter by. If used in conjunction with 'search', performs the search operation and then filters results by the provided tag. Use with tagsMode to specify filter approach.

tagsMode	STRING	"strict","exclude", "intersection", or "union".	Denotes how the "tags" parameter is handled: "strict" - matches only blocks that have the exact set of tags of specified. "exclude" - matches only blocks which are not tagged with any of the blocks specified. "intersection" - matches any blocks which has all of the tags. "union" - matches all blocks which has any one of the tags. If not otherwise specified, tagsMode defaults to "intersection".
topAggregateId	INTEGER	1234	The ID of the aggregate block to which the block belongs
type	STRING	"ipv4" or "ipv6"	IP type
vlan	INTEGER	123	VLAN for the block

Example URL /api/v1/api.php?target=ipam&action=get&rir=ARIN&tags=customer,vpn

Add

URL /api/v1/api.php?target=ipam&action=add

Description Adds an IPv4 or IPv6 block

Returns **Examples:**

SUCCESSFUL	<i>{"success":1,"message":"Block 192.168.0.0/24 (12345) added", "id":12345, "data":{"id":12345, "cidr":"192.168.0.0/24", ...} }</i>
ERROR	<i>{ "success":0, "message":"error message" }</i>

Required Parameters

Name	Type	Example	Description
block	STRING	213.37.29.0/24	CIDR block description
rir	STRING	ARIN	Acceptable values: ARIN, RIPE, APNIC, AfriNIC, LACNIC, 1918

Optional Parameters

Name	Type	Example	Description
allowDuplicate	BOOL	true	Allow the creation of duplicate blocks. The default behavior is to reject duplicates.
allowSubAssignments	BOOL	true	Does the block allow sub-assignments? If the block is assigned and allowSubAssignments is "true", children split from this block will be able to be assigned to different resources. Acceptable values: "true" or "false"
asn	INTEGER	1000	ASN for the block
code	STRING	Code X	User-defined block code as defined in Admin-IPAM settings: Generic Code Per Block Name
region	STRING	SFO	The value from the list of name/value pairs which make up the list of available regions
resourceId	INTEGER	1234	The ID of the resource the block is assigned to
tags	STRING	customer,vpn	Comma-separated list of tags
vlan	INTEGER	123	VLAN for the block

Example URL	/api/v1/api.php?target=ipam&action=add&block=213.37.29.0/24&rir=ARIN
-------------	--

Update

URL	/api/v1/api.php?target=ipam&action=update
-----	---

Description	Updates detail data about an IP block.
-------------	--

Returns	<p>Examples:</p> <table border="1"> <tr> <td>SUCCESSFUL</td> <td>SINGLE BLOCK</td> <td><code>{"success":1,"message":"Block 192.168.0.0/24 (12345) updated", "data":{"id":12345, "cidr":"192.168.0.0/24", ...}}</code></td> </tr> <tr> <td>SUCCESSFUL</td> <td>MULTIPLE BLOCKS</td> <td><code>{"success":1,"message":"3 blocks updated", "data":[{"id":12345, "cidr":"192.168.0.0/24", ...}, {"id":12346, "cidr": "192.168.0.1/32", ...}]}</code></td> </tr> <tr> <td>ERROR</td> <td></td> <td><code>{"success":0, "message":"error message" }</code></td> </tr> </table>	SUCCESSFUL	SINGLE BLOCK	<code>{"success":1,"message":"Block 192.168.0.0/24 (12345) updated", "data":{"id":12345, "cidr":"192.168.0.0/24", ...}}</code>	SUCCESSFUL	MULTIPLE BLOCKS	<code>{"success":1,"message":"3 blocks updated", "data":[{"id":12345, "cidr":"192.168.0.0/24", ...}, {"id":12346, "cidr": "192.168.0.1/32", ...}]}</code>	ERROR		<code>{"success":0, "message":"error message" }</code>
SUCCESSFUL	SINGLE BLOCK	<code>{"success":1,"message":"Block 192.168.0.0/24 (12345) updated", "data":{"id":12345, "cidr":"192.168.0.0/24", ...}}</code>								
SUCCESSFUL	MULTIPLE BLOCKS	<code>{"success":1,"message":"3 blocks updated", "data":[{"id":12345, "cidr":"192.168.0.0/24", ...}, {"id":12346, "cidr": "192.168.0.1/32", ...}]}</code>								
ERROR		<code>{"success":0, "message":"error message" }</code>								

Required Parameters	
---------------------	--

Name	Type	Example	Allow Multiple	Description
id*	INTEGER	125	Yes	ID of the IP block. Multiple block IDs can be specified in a comma-separated list.
block*	STRING	192.0.0.0/24	Yes	CIDR or the block. Multiple CIDRs can be specified in a comma-separated list.

*Either block or id can be used, but only one must be provided

Optional Parameters	
---------------------	--

Name	Type	Example	Description
allowSubAssignments	BOOL	true	Does the block allow sub-assignments? If the block is assigned and allowSubAssignments is "true", children split from this block will be able to be assigned to different resources. Acceptable values: "true" or "false"
asn	INTEGER	1000	ASN for the block
code	STRING	Code X	Arbitrary user-defined block code
lirId	INTEGER	101	The numeric ID of an LIR resource the block should be linked to
notes	STRING	Words	Misc. Notes
region	STRING	Chicago, IL	The region this IP block is assigned to.
propagate	BOOL	true	Propagates all attribute values to any smaller child blocks of the block being updated. Available in version 5.1.0
rir	STRING	ARIN	Acceptable values: ARIN, RIPE, APNIC, AfriNIC, LACNIC, 1918
tags	STRING	Customer, vpn	Comma-separated list of tags
tags_action	STRING	replace	What action to take on the supplied tags. This action must be taken in conjunction with the tags parameter. Valid settings for tags_action are: replace, add, delete. When tags_action is set to 'replace', all tags on an IP block are replaced with those
vlan	NUMERIC	123	VLAN for the block

Example URL	/api/v1/api.php?target=ipam&action=update&block=192.0.0.0/24¬es=Notes_here
-------------	---

Delete													
URL	/api/v1/api.php?target=ipam&action=delete												
Description	Deletes an aggregate block												
Returns	<p>Examples</p> <table border="1"> <tr> <td>SUCCESSFUL</td> <td><code>{"success":1,"message":"Aggregate deleted: 192.168.0.0/24", "data":{"id":12345, "cidr":192.168.0.0/24, ...}}</code></td> </tr> <tr> <td>ERROR</td> <td><code>{"success":0, "message":"error message" }</code></td> </tr> </table>	SUCCESSFUL	<code>{"success":1,"message":"Aggregate deleted: 192.168.0.0/24", "data":{"id":12345, "cidr":192.168.0.0/24, ...}}</code>	ERROR	<code>{"success":0, "message":"error message" }</code>								
SUCCESSFUL	<code>{"success":1,"message":"Aggregate deleted: 192.168.0.0/24", "data":{"id":12345, "cidr":192.168.0.0/24, ...}}</code>												
ERROR	<code>{"success":0, "message":"error message" }</code>												
Required Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>block*</td> <td>STRING</td> <td>213.37.29.0/24</td> <td>CIDR block description</td> </tr> <tr> <td>id*</td> <td>INTEGER</td> <td>125</td> <td>ID of the IP block</td> </tr> </tbody> </table> <p>*Either block or id can be used, but only one must be provided</p>	Name	Type	Example	Description	block*	STRING	213.37.29.0/24	CIDR block description	id*	INTEGER	125	ID of the IP block
Name	Type	Example	Description										
block*	STRING	213.37.29.0/24	CIDR block description										
id*	INTEGER	125	ID of the IP block										
Optional Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>force</td> <td>BOOL</td> <td>true</td> <td>Forces the aggregate block to be deleted even if the block is split or contains sub blocks which are assigned. The default behavior is to reject attempts to delete blocks which have been split or are assigned.</td> </tr> </tbody> </table>	Name	Type	Example	Description	force	BOOL	true	Forces the aggregate block to be deleted even if the block is split or contains sub blocks which are assigned. The default behavior is to reject attempts to delete blocks which have been split or are assigned.				
Name	Type	Example	Description										
force	BOOL	true	Forces the aggregate block to be deleted even if the block is split or contains sub blocks which are assigned. The default behavior is to reject attempts to delete blocks which have been split or are assigned.										
Example URL	/api/v1/api.php?target=ipam&action=delete&block=213.37.29.0/24												

Add Tag																					
URL	/api/v1/api.php?target=ipam&action=addTag																				
Description	Adds a tag to an IP block.																				
Returns	<p>Examples:</p> <table border="1"> <tr> <td>SUCCESSFUL</td> <td><code>{"success":1,"message":"Tag Added.", "data":{"id":12345, "cidr":192.168.0.0/24, ...}}</code></td> </tr> <tr> <td>ERROR</td> <td><code>{"success":0, "message":"error message" }</code></td> </tr> </table>	SUCCESSFUL	<code>{"success":1,"message":"Tag Added.", "data":{"id":12345, "cidr":192.168.0.0/24, ...}}</code>	ERROR	<code>{"success":0, "message":"error message" }</code>																
SUCCESSFUL	<code>{"success":1,"message":"Tag Added.", "data":{"id":12345, "cidr":192.168.0.0/24, ...}}</code>																				
ERROR	<code>{"success":0, "message":"error message" }</code>																				
Required Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>id*</td> <td>INTEGER</td> <td>125</td> <td>ID of the block</td> </tr> <tr> <td>block*</td> <td>STRING</td> <td>192.0.0.0/24</td> <td>CIDR of the block</td> </tr> </tbody> </table> <p>*Either block or id can be used, but only one must be provided</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>tag</td> <td>STRING</td> <td>Customer</td> <td>The tag to add</td> </tr> </tbody> </table>	Name	Type	Example	Description	id*	INTEGER	125	ID of the block	block*	STRING	192.0.0.0/24	CIDR of the block	Name	Type	Example	Description	tag	STRING	Customer	The tag to add
Name	Type	Example	Description																		
id*	INTEGER	125	ID of the block																		
block*	STRING	192.0.0.0/24	CIDR of the block																		
Name	Type	Example	Description																		
tag	STRING	Customer	The tag to add																		
Optional Parameters	None																				
Example URL	/api/v1/api.php?target=ipam&action=addTag&id=125&tag=Customer																				

Delete Tag	
URL	/api/v1/api.php?target=ipam&action=deleteTag
Description	Removes a tag from an IP block.

Returns	<p>Examples:</p> <table border="1"> <tr> <td>SUCCESSFUL</td> <td><code>{ "success":1,"message":"Tag Removed.", "data":{"id":12345, "cidr":"192.168.0.0/24", ...} }</code></td> </tr> <tr> <td>ERROR</td> <td><code>{ "success":0, "message":"error message" }</code></td> </tr> </table>	SUCCESSFUL	<code>{ "success":1,"message":"Tag Removed.", "data":{"id":12345, "cidr":"192.168.0.0/24", ...} }</code>	ERROR	<code>{ "success":0, "message":"error message" }</code>																
SUCCESSFUL	<code>{ "success":1,"message":"Tag Removed.", "data":{"id":12345, "cidr":"192.168.0.0/24", ...} }</code>																				
ERROR	<code>{ "success":0, "message":"error message" }</code>																				
Required Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>id*</td> <td>INTEGER</td> <td>125</td> <td>ID of the block</td> </tr> <tr> <td>block*</td> <td>STRING</td> <td>192.0.0.0/24</td> <td>CIDR of the block</td> </tr> <tr> <td colspan="4">*Either block or id can be used, but only one must be provided</td> </tr> <tr> <td>tag</td> <td>STRING</td> <td>Customer</td> <td>The tag to delete</td> </tr> </tbody> </table>	Name	Type	Example	Description	id*	INTEGER	125	ID of the block	block*	STRING	192.0.0.0/24	CIDR of the block	*Either block or id can be used, but only one must be provided				tag	STRING	Customer	The tag to delete
Name	Type	Example	Description																		
id*	INTEGER	125	ID of the block																		
block*	STRING	192.0.0.0/24	CIDR of the block																		
*Either block or id can be used, but only one must be provided																					
tag	STRING	Customer	The tag to delete																		
Optional Parameters	None																				
Example URL	/api/v1/api.php?target=ipam&action=deleteTag&id=125&tag=Customer																				

Smart Assign

URL	/api/v1/api.php?target=ipam&action=smartAssign																																
Description	Selects a block based on supplied parameters (rir, tags, mask size, etc.) and assigns it to a Resource Holder.																																
Returns	<p>Examples:</p> <table border="1"> <tr> <td>SUCCESSFUL</td> <td><code>{ "success":1,"message":"Assigned 192.168.0.0/24 to Resource (1234) via Smart Assign", "id":12345, "data":{"id":12345, "cidr":"192.168.0.0/24", ...} }</code></td> </tr> <tr> <td>ERROR</td> <td><code>{ "success":0, "message":"error message" }</code></td> </tr> </table>	SUCCESSFUL	<code>{ "success":1,"message":"Assigned 192.168.0.0/24 to Resource (1234) via Smart Assign", "id":12345, "data":{"id":12345, "cidr":"192.168.0.0/24", ...} }</code>	ERROR	<code>{ "success":0, "message":"error message" }</code>																												
SUCCESSFUL	<code>{ "success":1,"message":"Assigned 192.168.0.0/24 to Resource (1234) via Smart Assign", "id":12345, "data":{"id":12345, "cidr":"192.168.0.0/24", ...} }</code>																																
ERROR	<code>{ "success":0, "message":"error message" }</code>																																
Required Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>mask</td> <td>INTEGER</td> <td>24</td> <td>The size of the block to be assigned</td> </tr> <tr> <td>rir</td> <td>STRING</td> <td>ARIN</td> <td>Acceptable values: ARIN, RIPE, APNIC, AfriNIC, LACNIC, 1918</td> </tr> <tr> <td>resourceId*</td> <td>INTEGER</td> <td>1234</td> <td>Integer ID of the resource to assign the block to</td> </tr> <tr> <td>resourceQuery*</td> <td>JSON</td> <td><code>{ "custom_id": "cust-001" }</code></td> <td>A JSON object representing a valid resource query. Any parameters that can be used for a Resource GET API call can be used. Use of the resourceQuery parameter will return blocks assigned to any of the resources returned by that query.	*Either resourceId or resourceQuery can be used, but only one must be provided				resourceHolderId	STRING	cust-001	(Deprecated): Use resourceQuery instead A custom ID which can be used to link resources in the 6Connect database back to your organization.	type	STRING	"IPv4" or "IPv6"	The type of block to assign
Name	Type	Example	Description																														
mask	INTEGER	24	The size of the block to be assigned																														
rir	STRING	ARIN	Acceptable values: ARIN, RIPE, APNIC, AfriNIC, LACNIC, 1918																														
resourceId*	INTEGER	1234	Integer ID of the resource to assign the block to																														
resourceQuery*	JSON	<code>{ "custom_id": "cust-001" }</code>	A JSON object representing a valid resource query. Any parameters that can be used for a Resource GET API call can be used. Use of the resourceQuery parameter will return blocks assigned to any of the resources returned by that query.																														
*Either resourceId or resourceQuery can be used, but only one must be provided																																	
resourceHolderId	STRING	cust-001	(Deprecated): Use resourceQuery instead A custom ID which can be used to link resources in the 6Connect database back to your organization.																														
type	STRING	"IPv4" or "IPv6"	The type of block to assign																														

Optional Parameters*	Name	Type	Example	Description
	assignedResourceId	STRING	"123" or "ignore"	The ID of the resource the block is assigned to, or the string "ignore". If assignedResourceId is set to "ignore", then a matching IP block is selected from the Available pool or any sub-assignable block on any resource.
	code	STRING	Code X	Arbitrary user-defined block code
	lirId	INTEGER	101	The ID of an LIR resource
	region	STRING	Ashburn	Region to assign from
	tags	STRING	customer,vpn	Comma separated string of tags. Matches blocks which have at least the set of tag specified by this parameter
	tagsMode	STRING	"strict", "exclude", "intersection", or "union".	Denotes how the "tags" parameter is handled: "strict" - matches only blocks that have the exact set of tags of specified. "exclude" - matches only blocks which are not tagged with any of the blocks specified. "intersection" - matches any blocks which has all of the tags. "union" - matches all blocks which has any one of the tags. If not otherwise specified, tagsMode defaults to "intersection".
	vlan	INTEGER	1023	VLAN designated to a given block
*Additional or fewer "optional" parameters may be required in order to result in a successful assignment, depending on the attributes of available blocks.				
Example URL	/api/v1/api.php?target=ipam&action=smartAssign&mask=24&type=IPv4&resourceId=250&rir=ARIN			

Direct Assign

URL	/api/v1/api.php?target=ipam&action=directAssign											
Description	Assigns a block to an Resource Holder											
Returns	Examples: <table border="1" style="margin-top: 10px;"> <tr> <td>SUCCESSFUL</td> <td>SINGLE BLOCK</td> <td>{ "success":1, "message":"Assigned 192.168.0.0/24 to Resource (1234)", "id":12345, "data":{"id":12345, "cidr":192.168.0.0/24, ...} }</td> </tr> <tr> <td>SUCCESSFUL</td> <td>MULTIPLE BLOCKS</td> <td>{ "success":1, "message":"Assigned 5 blocks to Resource (1234) via Direct Assign", "data":{"ids":[12345, 12346, 12347, ...]} }</td> </tr> <tr> <td>ERROR</td> <td></td> <td>{ "success":0, "message":"error message" }</td> </tr> </table>			SUCCESSFUL	SINGLE BLOCK	{ "success":1, "message":"Assigned 192.168.0.0/24 to Resource (1234)", "id":12345, "data":{"id":12345, "cidr":192.168.0.0/24, ...} }	SUCCESSFUL	MULTIPLE BLOCKS	{ "success":1, "message":"Assigned 5 blocks to Resource (1234) via Direct Assign", "data":{"ids":[12345, 12346, 12347, ...]} }	ERROR		{ "success":0, "message":"error message" }
SUCCESSFUL	SINGLE BLOCK	{ "success":1, "message":"Assigned 192.168.0.0/24 to Resource (1234)", "id":12345, "data":{"id":12345, "cidr":192.168.0.0/24, ...} }										
SUCCESSFUL	MULTIPLE BLOCKS	{ "success":1, "message":"Assigned 5 blocks to Resource (1234) via Direct Assign", "data":{"ids":[12345, 12346, 12347, ...]} }										
ERROR		{ "success":0, "message":"error message" }										

Required Parameters	Name	Type	Example	Description
	block*	STRING	213.37.29.0/24	CIDR block description
	id*	INTEGER	125	ID of the IP block, comma separated list of ids, or json encoded array of ids
	*Either block or id can be used, but only one must be provided			
	resourceHolderId**	STRING	cust-001	(Deprecated): Use resourceQuery instead) A custom ID which can be used to link resources in the 6Connect database back to your organization.
	resourceId**	INTEGER	1234	Integer ID of the resource to assign the block to
	resourceQuery**	JSON	<pre>{"custom_id": "cust-001"}</pre>	A JSON object representing a valid resource query. Any parameters that can be used for a Resource GET API call can be used. Use of the resourceQuery parameter will return blocks assigned to any of the resources returned by that query.
**Either resourceId, resourceQuery, or resourceHolderId can be used, but only one must be provided				
Optional Parameters*	Name	Type	Example	Description
	code	STRING	Code X	Arbitrary user-defined block code
	lirId	INTEGER	101	The ID of an LIR resource
	region	STRING	Ashburn	Region to assign from
	rir	STRING	ARIN	Acceptable values: ARIN, RIPE, APNIC, AfriNIC, LACNIC, 1918
	tags	STRING	customer,vpn	Comma separated string of tags. Matches blocks which have at least the set of tag specified by this parameter
	tagsMode	STRING	"strict", "exclude", "intersection", or "union".	Denotes how the "tags" parameter is handled: "strict" - matches only blocks that have the exact set of tags of specified. "exclude" - matches only blocks which are not tagged with any of the blocks specified. "intersection" - matches any blocks which has all of the tags. "union" - matches all blocks which has any one of the tags. If not otherwise specified, tagsMode defaults to "intersection".
	vlan	INTEGER	1023	VLAN designated to a given block
*Additional or fewer "optional" parameters may be required in order to result in a successful assignment, depending on the attributes of available blocks.				
Example URL	/api/v1/api.php?target=ipam&action=directAssign&block=213.37.29.0/24&resourceId=1234			

Unassign

URL	/api/v1/api.php?target=ipam&action=unassign
Description	Reclaims the specified block to be reassigned in the future

Returns	Examples: <table border="1"> <tr> <td>SUCCESSFUL</td> <td colspan="3"><code>{ "success":1, "message":"192.168.0.0/24 unassigned", "id":12345, "data":{"id":12345, "cidr":"192.168.0.0/24", ...} }</code></td> </tr> <tr> <td>ERROR</td> <td colspan="3"><code>{ "success":0, "message":"error message" }</code></td> </tr> </table>				SUCCESSFUL	<code>{ "success":1, "message":"192.168.0.0/24 unassigned", "id":12345, "data":{"id":12345, "cidr":"192.168.0.0/24", ...} }</code>			ERROR	<code>{ "success":0, "message":"error message" }</code>						
SUCCESSFUL	<code>{ "success":1, "message":"192.168.0.0/24 unassigned", "id":12345, "data":{"id":12345, "cidr":"192.168.0.0/24", ...} }</code>															
ERROR	<code>{ "success":0, "message":"error message" }</code>															
Required Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>block*</td> <td>STRING</td> <td>213.37.29.0/24</td> <td>CIDR block description</td> </tr> <tr> <td>id*</td> <td>INTEGER</td> <td>125</td> <td>ID of the IP block</td> </tr> </tbody> </table> <p>*Either block or id can be used, but only one must be provided</p>				Name	Type	Example	Description	block*	STRING	213.37.29.0/24	CIDR block description	id*	INTEGER	125	ID of the IP block
Name	Type	Example	Description													
block*	STRING	213.37.29.0/24	CIDR block description													
id*	INTEGER	125	ID of the IP block													
Optional Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>skipHolding</td> <td>BOOL</td> <td>true</td> <td>If set to true (skipHolding=true) then the holding tank is skipped. If set to false, or not included, normal holding tank rules apply. Acceptable values: "true" or "false"</td> </tr> </tbody> </table>				Name	Type	Example	Description	skipHolding	BOOL	true	If set to true (skipHolding=true) then the holding tank is skipped. If set to false, or not included, normal holding tank rules apply. Acceptable values: "true" or "false"				
Name	Type	Example	Description													
skipHolding	BOOL	true	If set to true (skipHolding=true) then the holding tank is skipped. If set to false, or not included, normal holding tank rules apply. Acceptable values: "true" or "false"													
Example URL	/api/v1/api.php?target=ipam&action=unassign&block=213.37.29.0/24															

Get Tags List

URL	/api/v1/api.php?target=ipam&action=getTagList				
Description	Returns a list of all valid IP Tags in the database.				
Returns	Examples: <table border="1"> <tr> <td>SUCCESSFUL</td> <td><code>{ "success":1, "message":"Tags Retrieved.", "data":{"value":"IT", "name":"IT"}, {"value":"LTE", "name":"LTE Mobile"}, {"value":"PTP", "name":"Point to Point"}, {"value":"Prod", "name":"Production"}, {"value":"VM", "name":"Virtual Machines"}, {"value":"VOIP", "name":"VOIP"}, {"value":"ANY", "name":"ANY"} }</code></td> </tr> <tr> <td>ERROR</td> <td><code>{ 'success':0, 'message':'error message' }</code></td> </tr> </table>	SUCCESSFUL	<code>{ "success":1, "message":"Tags Retrieved.", "data":{"value":"IT", "name":"IT"}, {"value":"LTE", "name":"LTE Mobile"}, {"value":"PTP", "name":"Point to Point"}, {"value":"Prod", "name":"Production"}, {"value":"VM", "name":"Virtual Machines"}, {"value":"VOIP", "name":"VOIP"}, {"value":"ANY", "name":"ANY"} }</code>	ERROR	<code>{ 'success':0, 'message':'error message' }</code>
SUCCESSFUL	<code>{ "success":1, "message":"Tags Retrieved.", "data":{"value":"IT", "name":"IT"}, {"value":"LTE", "name":"LTE Mobile"}, {"value":"PTP", "name":"Point to Point"}, {"value":"Prod", "name":"Production"}, {"value":"VM", "name":"Virtual Machines"}, {"value":"VOIP", "name":"VOIP"}, {"value":"ANY", "name":"ANY"} }</code>				
ERROR	<code>{ 'success':0, 'message':'error message' }</code>				

Add Tag To List

URL	/api/v1/api.php?target=ipam&action=addTagToList								
Description	Adds a tag to the IPAM tag list								
Returns	Examples: <table border="1"> <tr> <td>SUCCESSFUL</td> <td><code>{ "success":1, "message":"Tag Added." }</code></td> </tr> <tr> <td>ERROR</td> <td><code>{ 'success':0, 'message':'error message' }</code></td> </tr> </table>	SUCCESSFUL	<code>{ "success":1, "message":"Tag Added." }</code>	ERROR	<code>{ 'success':0, 'message':'error message' }</code>				
SUCCESSFUL	<code>{ "success":1, "message":"Tag Added." }</code>								
ERROR	<code>{ 'success':0, 'message':'error message' }</code>								
Required Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>newTag</td> <td>STRING</td> <td>Loopback C</td> <td>The value to add to the list of name/value pairs which make up the list of available regions</td> </tr> </tbody> </table>	Name	Type	Example	Description	newTag	STRING	Loopback C	The value to add to the list of name/value pairs which make up the list of available regions
Name	Type	Example	Description						
newTag	STRING	Loopback C	The value to add to the list of name/value pairs which make up the list of available regions						
Optional Parameters	None								

Example URL	/api/v1/api.php?target=ipam&action=addTagToList&newTag=Loopback C
-------------	---

Get Regions List

URL	/api/v1/api.php?target=ipam&action=getRegionList				
Description	Returns a list of all valid Regions in the database.				
Returns	<p>Examples:</p> <table border="1"> <tr> <td>SUCCESSFUL</td> <td><pre>{ "success":1, "message":"Regions Retrieved.", "data":{"value":"ANY", "name":"Any Region"}, {"value":"ASH1", "name":"Ashburn, VA"}, {"value":"BOS", "name":"Boston, MA"}, {"value":"CHI", "name":"Chicago, IL"}, {"value":"DAL", "name":"Dallas, TX"}, {"value":"DEN", "name":"Denver, CO"}, {"value":"FRKT", "name":"Frankfurt, DE"}, {"value":"LON1", "name":"London, UK"}, {"value":"MIA", "name":"Miami, FL"}, {"value":"PAR", "name":"Paris, FR"}, {"value":"SFO", "name":"San Francisco, CA"}, {"value":"SEA", "name":"Seattle, WA"}, {"value":"Tokyo", "name":"Tokyo"}, {"value":"Singapore", "name":"Singapore"}, {"value":"Jakarta", "name":"Jakarta"} }</pre></td> </tr> <tr> <td>ERROR</td> <td><pre>{ 'success':0, 'message':'error message' }</pre></td> </tr> </table>	SUCCESSFUL	<pre>{ "success":1, "message":"Regions Retrieved.", "data":{"value":"ANY", "name":"Any Region"}, {"value":"ASH1", "name":"Ashburn, VA"}, {"value":"BOS", "name":"Boston, MA"}, {"value":"CHI", "name":"Chicago, IL"}, {"value":"DAL", "name":"Dallas, TX"}, {"value":"DEN", "name":"Denver, CO"}, {"value":"FRKT", "name":"Frankfurt, DE"}, {"value":"LON1", "name":"London, UK"}, {"value":"MIA", "name":"Miami, FL"}, {"value":"PAR", "name":"Paris, FR"}, {"value":"SFO", "name":"San Francisco, CA"}, {"value":"SEA", "name":"Seattle, WA"}, {"value":"Tokyo", "name":"Tokyo"}, {"value":"Singapore", "name":"Singapore"}, {"value":"Jakarta", "name":"Jakarta"} }</pre>	ERROR	<pre>{ 'success':0, 'message':'error message' }</pre>
SUCCESSFUL	<pre>{ "success":1, "message":"Regions Retrieved.", "data":{"value":"ANY", "name":"Any Region"}, {"value":"ASH1", "name":"Ashburn, VA"}, {"value":"BOS", "name":"Boston, MA"}, {"value":"CHI", "name":"Chicago, IL"}, {"value":"DAL", "name":"Dallas, TX"}, {"value":"DEN", "name":"Denver, CO"}, {"value":"FRKT", "name":"Frankfurt, DE"}, {"value":"LON1", "name":"London, UK"}, {"value":"MIA", "name":"Miami, FL"}, {"value":"PAR", "name":"Paris, FR"}, {"value":"SFO", "name":"San Francisco, CA"}, {"value":"SEA", "name":"Seattle, WA"}, {"value":"Tokyo", "name":"Tokyo"}, {"value":"Singapore", "name":"Singapore"}, {"value":"Jakarta", "name":"Jakarta"} }</pre>				
ERROR	<pre>{ 'success':0, 'message':'error message' }</pre>				

Add Region To List

URL	/api/v1/api.php?target=ipam&action=addRegionToList								
Description	Adds a region to the IPAM region list								
Returns	<p>Examples:</p> <table border="1"> <tr> <td>SUCCESSFUL</td> <td><pre>{ "success":1, "message":"Region Added." }</pre></td> </tr> <tr> <td>ERROR</td> <td><pre>{ 'success':0, 'message':'error message' }</pre></td> </tr> </table>	SUCCESSFUL	<pre>{ "success":1, "message":"Region Added." }</pre>	ERROR	<pre>{ 'success':0, 'message':'error message' }</pre>				
SUCCESSFUL	<pre>{ "success":1, "message":"Region Added." }</pre>								
ERROR	<pre>{ 'success':0, 'message':'error message' }</pre>								
Required Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>newRegion</td> <td>STRING</td> <td>SFO</td> <td>The value to add to the list of name/value pairs which make up the list of available regions</td> </tr> </tbody> </table>	Name	Type	Example	Description	newRegion	STRING	SFO	The value to add to the list of name/value pairs which make up the list of available regions
Name	Type	Example	Description						
newRegion	STRING	SFO	The value to add to the list of name/value pairs which make up the list of available regions						
Optional Parameters	None								
Example URL	/api/v1/api.php?target=ipam&action=addRegionToList&newRegion=SFO								

Get Utilization

URL	/api/v1/api.php?target=ipam&action=utilization
Description	Gets the utilization percentages for a specific ip block or ip block and mask combination.

Returns

Examples:

SUCCESSFUL	<pre>{ "success": 1, "totalBlocks": 1, "totalHosts": "256", "hostsAssigned": 0, "hostsAllocated": "256", "hostsAvailable": "256", "hostsInHolding": 0, "availablePercentage": "100.00", "assignedPercentage": "0.00", "allocatedPercentage": "100.00", "inHoldingPercentage": "0.00", "resources": [{ "id": 351, "name": "Customer 1", "type": "entry", "hosts": "256", "blocks": "1", "percentage": "100.00" }], "blocksAssigned": 0, "blocksAllocated": 1, "blocksAvailable": "1", "blocksInHolding": null, "blocksAssignedPercentage": "0.00", "blocksAllocatedPercentage": "100.00", "blocksAvailablePercentage": "100.00", "blocksInHoldingPercentage": "0.00" }</pre>
ERROR	<pre>{'success':0, 'message':'error message'}</pre>

Required Parameters

Name	Type	Example	Description
block*	STRING	213.37.29.0/24	CIDR block description
id*	INTEGER	125	ID of the IP block
*Either block or id can be used, but only one must be provided			

Optional Parameters	Name	Type	Example	Description
	mask	INTEGER	24	The specific mask size to retrieve utilization for. If using this parameter, the id parameter should be the id of the aggregate.
Example URL	/api/v1/api.php?target=ipam&action=utilization&id=125			

Get Host Utilization

URL	/api/v1/api.php?target=ipam&action=getHostUtilization								
Description	Gets the host utilization statistics with support for filters.								
Returns	<p>Examples:</p> <table border="1"> <tr> <td>SUCCESSFUL</td> <td> <pre>{ "success": 1, "totalHosts": "256", "hostsAssigned": 0, "hostsAllocated": "256", "hostsAvailable": "256", "hostsInHolding": 0, "availablePercentage": "100.00", "assignedPercentage": "0.00", "allocatedPercentage": "100.00", "inHoldingPercentage": "0.00", "resources": [{ "id": 351, "name": "Customer 1", "type": "entry", "hosts": "256", "blocks": "1", "percentage": "100.00" }] }</pre> </td> </tr> <tr> <td>ERROR</td> <td><code>{'success':0, 'message':'error message'}</code></td> </tr> </table>	SUCCESSFUL	<pre>{ "success": 1, "totalHosts": "256", "hostsAssigned": 0, "hostsAllocated": "256", "hostsAvailable": "256", "hostsInHolding": 0, "availablePercentage": "100.00", "assignedPercentage": "0.00", "allocatedPercentage": "100.00", "inHoldingPercentage": "0.00", "resources": [{ "id": 351, "name": "Customer 1", "type": "entry", "hosts": "256", "blocks": "1", "percentage": "100.00" }] }</pre>	ERROR	<code>{'success':0, 'message':'error message'}</code>				
SUCCESSFUL	<pre>{ "success": 1, "totalHosts": "256", "hostsAssigned": 0, "hostsAllocated": "256", "hostsAvailable": "256", "hostsInHolding": 0, "availablePercentage": "100.00", "assignedPercentage": "0.00", "allocatedPercentage": "100.00", "inHoldingPercentage": "0.00", "resources": [{ "id": 351, "name": "Customer 1", "type": "entry", "hosts": "256", "blocks": "1", "percentage": "100.00" }] }</pre>								
ERROR	<code>{'success':0, 'message':'error message'}</code>								
Required Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>type</td> <td>STRING</td> <td>"ipv4" or "ipv6"</td> <td>IP type</td> </tr> </tbody> </table>	Name	Type	Example	Description	type	STRING	"ipv4" or "ipv6"	IP type
Name	Type	Example	Description						
type	STRING	"ipv4" or "ipv6"	IP type						

Optional Parameters	Name	Type	Example	Multiple Values	Description
	code	STRING	"code-1"	Yes	User-defined block code as defined in Admin-IPAM settings: Generic Code Per Block Name
	region	STRING	"SFO"	Yes	Region to assign from
	rir	STRING	ARIN	No	Acceptable values: ARIN, RIPE, APNIC, AfriNIC, LACNIC, 1918
	tags	STRING	"Customer"	Yes	Comma separated string of tags
	vlan	INTEGER	1000	Yes	VLAN designated to a given block
	<p>NOTE: to filter using multiple values, pass the values as a JSON-encoded string representation of an array.</p> <p>For example, to get utilization data for multiple tags, you could use the following URL:</p> <pre>/api/v1/api.php?target=ipam&action=getHostUtilization&type=ipv4&tags=["Customer","PTP"]</pre>				
Example URL	<pre>/api/v1/api.php?target=ipam&action=getHostUtilization&type=ipv4&tags=["Customer","PTP"]&region=SMF</pre>				

Aggregate													
URL	<pre>/api/v1/api.php?target=ipam&action=aggregate</pre>												
Description	Aggregates a selected block to the mask specified. If no mask specified, re-aggregates blocks to next parent. IE. calling aggregate on a /25 will aggregate both children back to the parent /24. All child blocks must be Available for aggregation to succeed.												
Returns	<p>Examples:</p> <table border="1"> <tr> <td>SUCCESSFUL</td> <td><pre>{ "success": 1, "message": "10.2.0.128\25 aggregated into 10.2.0.0\24", "id": 16326 }</pre></td> </tr> <tr> <td>ERROR</td> <td><pre>{ 'success': 0, 'message': 'error message' }</pre></td> </tr> </table>	SUCCESSFUL	<pre>{ "success": 1, "message": "10.2.0.128\25 aggregated into 10.2.0.0\24", "id": 16326 }</pre>	ERROR	<pre>{ 'success': 0, 'message': 'error message' }</pre>								
SUCCESSFUL	<pre>{ "success": 1, "message": "10.2.0.128\25 aggregated into 10.2.0.0\24", "id": 16326 }</pre>												
ERROR	<pre>{ 'success': 0, 'message': 'error message' }</pre>												
Required Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>id*</td> <td>INTEGER</td> <td>125</td> <td>ID of the IP block.</td> </tr> <tr> <td>block*</td> <td>STRING</td> <td>213.37.29.0/24</td> <td>CIDR block.</td> </tr> </tbody> </table> <p>*Either block or id can be used, but only one must be provided</p>	Name	Type	Example	Description	id*	INTEGER	125	ID of the IP block.	block*	STRING	213.37.29.0/24	CIDR block.
Name	Type	Example	Description										
id*	INTEGER	125	ID of the IP block.										
block*	STRING	213.37.29.0/24	CIDR block.										
Optional Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>autoAggregateToMask</td> <td>INTEGER</td> <td>24</td> <td>All blocks and IPs smaller than this netmask will be aggregated.</td> </tr> <tr> <td>ignoreAssignments</td> <td>BOOL</td> <td>TRUE</td> <td>If the ignoreAssignment flag is not set the aggregation operation will fail if any children beneath the supplied autoAggregateToMask are assigned or otherwise unavailable. If this option is set, it will unassign blocks prior to reaggregation.</td> </tr> </tbody> </table>	Name	Type	Example	Description	autoAggregateToMask	INTEGER	24	All blocks and IPs smaller than this netmask will be aggregated.	ignoreAssignments	BOOL	TRUE	If the ignoreAssignment flag is not set the aggregation operation will fail if any children beneath the supplied autoAggregateToMask are assigned or otherwise unavailable. If this option is set, it will unassign blocks prior to reaggregation.
Name	Type	Example	Description										
autoAggregateToMask	INTEGER	24	All blocks and IPs smaller than this netmask will be aggregated.										
ignoreAssignments	BOOL	TRUE	If the ignoreAssignment flag is not set the aggregation operation will fail if any children beneath the supplied autoAggregateToMask are assigned or otherwise unavailable. If this option is set, it will unassign blocks prior to reaggregation.										
Example URL	<pre>/api/v1/api.php?target=ipam&action=aggregate&id=125&autoAggregateToMask=24</pre>												

Split

URL	/api/v1/api.php?target=ipam&action=split														
Description	Splits a selected block to the mask specified. If no mask specified, it split blocks to next child. IE. calling aggregate on a /24 will split both parent to the child /25s. All parent blocks must be Available, or have Allow Sub Assignments on for a split to succeed.														
Returns	Examples: <table border="1"> <tr> <td>SUCCESSFUL</td> <td colspan="3">{"success":1,"message":"10.1.0.0/24 split into 10.1.0.0/25 and 10.1.0.128/25","data":{"child1":23441,"child2":23451}}</td> </tr> <tr> <td>ERROR</td> <td colspan="3">{'success':0,'message':'error message'}</td> </tr> </table>			SUCCESSFUL	{"success":1,"message":"10.1.0.0/24 split into 10.1.0.0/25 and 10.1.0.128/25","data":{"child1":23441,"child2":23451}}			ERROR	{'success':0,'message':'error message'}						
SUCCESSFUL	{"success":1,"message":"10.1.0.0/24 split into 10.1.0.0/25 and 10.1.0.128/25","data":{"child1":23441,"child2":23451}}														
ERROR	{'success':0,'message':'error message'}														
Required Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>id*</td> <td>INTEGER</td> <td>125</td> <td>ID of the IP block.</td> </tr> <tr> <td>block*</td> <td>STRING</td> <td>213.37.29.0/24</td> <td>CIDR block.</td> </tr> </tbody> </table> <p>*Either block or id can be used, but only one must be provided</p>			Name	Type	Example	Description	id*	INTEGER	125	ID of the IP block.	block*	STRING	213.37.29.0/24	CIDR block.
Name	Type	Example	Description												
id*	INTEGER	125	ID of the IP block.												
block*	STRING	213.37.29.0/24	CIDR block.												
Optional Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>autoSplitToMask</td> <td>INTEGER</td> <td>24</td> <td>Auto aggregate the block back to this mask size. Note all blocks up this mask size must be Available or call will fail.</td> </tr> <tr> <td>autoSplitLimit</td> <td>INTEGER</td> <td>4</td> <td>A number the power of 2 (^2).</td> </tr> </tbody> </table>			Name	Type	Example	Description	autoSplitToMask	INTEGER	24	Auto aggregate the block back to this mask size. Note all blocks up this mask size must be Available or call will fail.	autoSplitLimit	INTEGER	4	A number the power of 2 (^2).
Name	Type	Example	Description												
autoSplitToMask	INTEGER	24	Auto aggregate the block back to this mask size. Note all blocks up this mask size must be Available or call will fail.												
autoSplitLimit	INTEGER	4	A number the power of 2 (^2).												
Example URL	/api/v1/api.php?target=ipam&action=split&block=213.37.29.0/24&autoSplitLimit=4														

Scan Block

URL	/api/v1/api.php?target=ipam&action=scanBlock														
Description	Initiates an asynchronous ping (ICMP) scan of the target block specified. Results of the scan can be checked with get.														
Returns	Examples: <table border="1"> <tr> <td>SUCCESSFUL</td> <td colspan="3">{"success":1,"message":"Ping scan started for 8.8.8.0/27"}</td> </tr> <tr> <td>ERROR</td> <td colspan="3">{'success':0,'message':'error message'}</td> </tr> </table>			SUCCESSFUL	{"success":1,"message":"Ping scan started for 8.8.8.0/27"}			ERROR	{'success':0,'message':'error message'}						
SUCCESSFUL	{"success":1,"message":"Ping scan started for 8.8.8.0/27"}														
ERROR	{'success':0,'message':'error message'}														
Required Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>id*</td> <td>INTEGER</td> <td>125</td> <td>ID of the IP block.</td> </tr> <tr> <td>block*</td> <td>STRING</td> <td>213.37.29.0/24</td> <td>CIDR block.</td> </tr> </tbody> </table> <p>*Either block or id can be used, but only one must be provided</p>			Name	Type	Example	Description	id*	INTEGER	125	ID of the IP block.	block*	STRING	213.37.29.0/24	CIDR block.
Name	Type	Example	Description												
id*	INTEGER	125	ID of the IP block.												
block*	STRING	213.37.29.0/24	CIDR block.												
Optional Parameters	None														
Example	/api/v1/api.php?target=ipam&action=scanBlock&block=213.37.29.0/24														

Get Scan Results

URL	/api/v1/api.php?target=ipam&action=getScanResults
-----	---

Description	Initiates an asynchronous ping (ICMP) scan of the target block specified. Results of the scan can be checked with get										
Returns	Examples:										
	SUCCESSFUL	{"success":1,"data":{"block":"8.8.8.0/27","date":"07/14/2014 11:07:10", "data":[{"address":"8.8.8.8","host":"google-public-dns-a.google.com","status":"Up"}]}									
	ERROR	{'success':0, 'message':'error message'}									
Required Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>block</td> <td>STRING</td> <td>213.37.29.0/24</td> <td>CIDR block.</td> </tr> </tbody> </table>			Name	Type	Example	Description	block	STRING	213.37.29.0/24	CIDR block.
Name	Type	Example	Description								
block	STRING	213.37.29.0/24	CIDR block.								
Optional Parameters	None										
Example	/api/v1/api.php?target=ipam&action=getScanResults&block=213.37.29.0/24										

Get Options

URL	/api/v1/api.php?target=ipam&action=getOptions										
Description	Returns a list of options available for the block										
Returns	Examples:										
	SUCCESSFUL	{"success":1,"message":"Options for 14.0.0.0V25 (125)","options":{"actions":["aggregate"],"templates":[{"name":"Auto Split","masks":[26,27,28,29,30,31,32]}}]}									
	ERROR	{'success':0, 'message':'error message'}									
Required Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>id</td> <td>INTEGER</td> <td>125</td> <td>ID of the IP block</td> </tr> </tbody> </table>			Name	Type	Example	Description	id	INTEGER	125	ID of the IP block
Name	Type	Example	Description								
id	INTEGER	125	ID of the IP block								
Optional Parameters	None										
Example URL	/api/v1/api.php?target=ipam&action=getOptions&id=125										

Get VLAN

URL	/api/v1/api.php?target=ipam&action=getVlan		
Description	Returns the VLAN for the block		
Returns	Examples:		
	SUCCESSFUL	{"success":1,"message":"Found VLAN 1002 (14.0.0.0V25)","data":{"id":125,"type":"ipv4","top_aggregate":81532,"cidr":"14.0.0.0V25","formatted_ip":"14.0.0.0v Labz","last_updated_time":"2015-01-22 12:30:37","description":null,"parent":81532,"rir":"ARIN","lir_id":"1062","nc 10:30:31","asn":"143","allowSubAssignments":true,"permissions":{"permissionIPAMRead":"1","permissionIPAML	
	ERROR	{'success':0, 'message':'error message'}	

Required Parameters	Name	Type	Example	Description
	id*	INTEGER	125	ID of the IP block
	block*	STRING	213.37.29.0/24	CIDR block.
	*Either block or id can be used, but only one must be provided			
Optional Parameters	None			
Example URL	/api/v1/api.php?target=ipam&action=getVlan&id=125			

Process Holding Tank

URL	/api/v1/api.php?target=ipam&action=processHoldingTank								
Description	Processes the Holding Tank, returning held blocks to available status								
Returns	Examples: <table border="1" data-bbox="267 829 1500 997"> <tr> <td>SUCCESSFUL</td> <td>{ "success":1, "message":"1 IPv4 and 0 IPv6 blocks would be moved to the available pool.", "data":{"id":77712, "type":"ipv4", "top_aggregate":77552, "cidr":"23.92.0.64V26", "formatted_ip":"23.92.0.64V26", "holding", "last_updated_time":"2014-10-29 11:25:41", "description":null, "parent":77682, "rir":"ARIN", "lir_id":"451", "r11:20:34", "asn":null, "allowSubAssignments":false, "permissions":{"permissionIPAMRead":"1", "permissionIPAMU</td> </tr> <tr> <td>ERROR</td> <td>{ "success":0, "message":"error message" }</td> </tr> </table>				SUCCESSFUL	{ "success":1, "message":"1 IPv4 and 0 IPv6 blocks would be moved to the available pool.", "data":{"id":77712, "type":"ipv4", "top_aggregate":77552, "cidr":"23.92.0.64V26", "formatted_ip":"23.92.0.64V26", "holding", "last_updated_time":"2014-10-29 11:25:41", "description":null, "parent":77682, "rir":"ARIN", "lir_id":"451", "r11:20:34", "asn":null, "allowSubAssignments":false, "permissions":{"permissionIPAMRead":"1", "permissionIPAMU	ERROR	{ "success":0, "message":"error message" }	
SUCCESSFUL	{ "success":1, "message":"1 IPv4 and 0 IPv6 blocks would be moved to the available pool.", "data":{"id":77712, "type":"ipv4", "top_aggregate":77552, "cidr":"23.92.0.64V26", "formatted_ip":"23.92.0.64V26", "holding", "last_updated_time":"2014-10-29 11:25:41", "description":null, "parent":77682, "rir":"ARIN", "lir_id":"451", "r11:20:34", "asn":null, "allowSubAssignments":false, "permissions":{"permissionIPAMRead":"1", "permissionIPAMU								
ERROR	{ "success":0, "message":"error message" }								
Required Parameters	None								
Optional Parameters	<table border="1" data-bbox="267 1129 1500 1318"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>preview</td> <td>BOOL</td> <td>true</td> <td>Acceptable values: "true" or "false" If set to "true", returns a list of blocks that would be removed from the holding tank, but does not con If set to "false", processes the holding tank and returns a list of blocks returned to available status.</td> </tr> </tbody> </table>	Name	Type	Example	Description	preview	BOOL	true	Acceptable values: "true" or "false" If set to "true", returns a list of blocks that would be removed from the holding tank, but does not con If set to "false", processes the holding tank and returns a list of blocks returned to available status.
Name	Type	Example	Description						
preview	BOOL	true	Acceptable values: "true" or "false" If set to "true", returns a list of blocks that would be removed from the holding tank, but does not con If set to "false", processes the holding tank and returns a list of blocks returned to available status.						
Example URL	/api/v1/api.php?target=ipam&action=processHoldingTank&preview=true								

Mask Report

URL	/api/v1/api.php?target=ipam&action=maskReport							
Description	Returns a JSON report breakdown of by-mask use statistics							
Returns	Examples: <table border="1" data-bbox="267 1659 1500 1753"> <tr> <td>SUCCESSFUL</td> <td>{ "success":1, "data":{"IPv4":{"total":576, "available":21, "assigned":555, "holding":0, "allocated":446, "prefixes":{"32":{</td> </tr> <tr> <td>ERROR</td> <td>{ "success":0, "message":"error message" }</td> </tr> </table>				SUCCESSFUL	{ "success":1, "data":{"IPv4":{"total":576, "available":21, "assigned":555, "holding":0, "allocated":446, "prefixes":{"32":{	ERROR	{ "success":0, "message":"error message" }
SUCCESSFUL	{ "success":1, "data":{"IPv4":{"total":576, "available":21, "assigned":555, "holding":0, "allocated":446, "prefixes":{"32":{							
ERROR	{ "success":0, "message":"error message" }							
Required Parameters	None							

Optional Parameters	Name	Type	Example	Description
	resource_id	INTEGER	1234	Integer value of a Resource ID. If provided, the system will display an IPAM Mask Usage r
	tags	STRING	"Customer"	Comma separated list of tags. If provided, limits the IPAM Mask Usage report to certain ta
	regions	STRING	"DEN"	Comma separated list of regions. If provided, limits the IPAM Mask Usage Report to block
Example URL	/api/v1/api.php?target=ipam&action=maskReport®ions=DEN			

IPAM SWIP Calls:

Deassign																												
URL	/api/v1/api.php?target=ipam&action=deassign																											
Description	Performs a SWIP deassignment for the indicated IPAM block.																											
Returns	Examples: <table border="1" style="margin-top: 10px;"> <tr> <td>SUCCESSFUL</td> <td>{ "success":1, "message": "success message" }</td> </tr> <tr> <td>ERROR</td> <td>{ "success":0, "message": "error message" }</td> </tr> </table>				SUCCESSFUL	{ "success":1, "message": "success message" }	ERROR	{ "success":0, "message": "error message" }																				
SUCCESSFUL	{ "success":1, "message": "success message" }																											
ERROR	{ "success":0, "message": "error message" }																											
Required Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>blockId</td> <td>INTEGER</td> <td>1234</td> <td>ID of the block to deassign</td> </tr> <tr> <td>block</td> <td>STRING</td> <td>67.221.241.0/24</td> <td>the CIDR of the block being de-assigned</td> </tr> <tr> <td>resourceId</td> <td>INTEGER</td> <td>1234</td> <td>ID of resource representing the customer to deassign</td> </tr> <tr> <td>lirId</td> <td>INTEGER</td> <td>1234</td> <td>The ProVision id of the LIR which is performing the de-assignment</td> </tr> <tr> <td>entityHandle</td> <td>STRING</td> <td>CONNE-81</td> <td>The Org ID for the LIR.</td> </tr> </tbody> </table>	Name	Type	Example	Description	blockId	INTEGER	1234	ID of the block to deassign	block	STRING	67.221.241.0/24	the CIDR of the block being de-assigned	resourceId	INTEGER	1234	ID of resource representing the customer to deassign	lirId	INTEGER	1234	The ProVision id of the LIR which is performing the de-assignment	entityHandle	STRING	CONNE-81	The Org ID for the LIR.			
Name	Type	Example	Description																									
blockId	INTEGER	1234	ID of the block to deassign																									
block	STRING	67.221.241.0/24	the CIDR of the block being de-assigned																									
resourceId	INTEGER	1234	ID of resource representing the customer to deassign																									
lirId	INTEGER	1234	The ProVision id of the LIR which is performing the de-assignment																									
entityHandle	STRING	CONNE-81	The Org ID for the LIR.																									
Optional Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>netName</td> <td>STRING</td> <td>6CONN-67-221-241-0-24</td> <td>Optional name for the network to override the default. The default net name will address for the block.</td> </tr> </tbody> </table>	Name	Type	Example	Description	netName	STRING	6CONN-67-221-241-0-24	Optional name for the network to override the default. The default net name will address for the block.																			
Name	Type	Example	Description																									
netName	STRING	6CONN-67-221-241-0-24	Optional name for the network to override the default. The default net name will address for the block.																									
Example URL	/api/v1/api.php?target=ipam&action=deassign&resourceId=1234&blockId=1234&lirId=1234&entityHandle=CONNE-81&block=67.22																											

Get RIR List								
URL	/api/v1/api.php?target=ipam&action=getRIRList							
Description	Returns a list of all valid RIRs in the database.							
Returns	Examples: <table border="1" style="margin-top: 10px;"> <tr> <td>SUCCESSFUL</td> <td>{ "success":1, "message": "RIRs Retrieved.", "data": { "value": "ARIN", "name": "ARIN"}, { "value": "1918", "name": "1918"}, { "value": "AfriNIC", "name": "Afi</td> </tr> <tr> <td>ERROR</td> <td>{ "success":0, "message": "error message" }</td> </tr> </table>				SUCCESSFUL	{ "success":1, "message": "RIRs Retrieved.", "data": { "value": "ARIN", "name": "ARIN"}, { "value": "1918", "name": "1918"}, { "value": "AfriNIC", "name": "Afi	ERROR	{ "success":0, "message": "error message" }
SUCCESSFUL	{ "success":1, "message": "RIRs Retrieved.", "data": { "value": "ARIN", "name": "ARIN"}, { "value": "1918", "name": "1918"}, { "value": "AfriNIC", "name": "Afi							
ERROR	{ "success":0, "message": "error message" }							

Simple Reassign																					
URL	/api/v1/api.php?target=ipam&action=simpleReassign																				
Description	ARIN SWIP - simple reassign. Creates an ARIN customer record for the assigned resource and reassigns the block to the ARIN cu:																				
Returns	<p>Examples:</p> <table border="1"> <tr> <td>SUCCESSFUL</td> <td>{ "success":1,"message":"Sent ARIN SWIP with action simpleReassign for 67.221.244.0/28 for Acme, Message:</td> </tr> <tr> <td>ERROR</td> <td>{ "success":0, "message":"error message" }</td> </tr> </table>	SUCCESSFUL	{ "success":1,"message":"Sent ARIN SWIP with action simpleReassign for 67.221.244.0/28 for Acme, Message:	ERROR	{ "success":0, "message":"error message" }																
SUCCESSFUL	{ "success":1,"message":"Sent ARIN SWIP with action simpleReassign for 67.221.244.0/28 for Acme, Message:																				
ERROR	{ "success":0, "message":"error message" }																				
Required Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>blockId</td> <td>INTEGER</td> <td>1234</td> <td>ID of the block to reassign</td> </tr> <tr> <td>resourceId</td> <td>INTEGER</td> <td>1234</td> <td>ID of resource representing the customer to reassign to</td> </tr> <tr> <td>lirId</td> <td>INTEGER</td> <td>1234</td> <td>The ProVision id of the LIR to use for reassignment</td> </tr> <tr> <td>entityHandle</td> <td>STRING</td> <td>CONNE-81</td> <td>The Org ID for the LIR.</td> </tr> </tbody> </table>	Name	Type	Example	Description	blockId	INTEGER	1234	ID of the block to reassign	resourceId	INTEGER	1234	ID of resource representing the customer to reassign to	lirId	INTEGER	1234	The ProVision id of the LIR to use for reassignment	entityHandle	STRING	CONNE-81	The Org ID for the LIR.
Name	Type	Example	Description																		
blockId	INTEGER	1234	ID of the block to reassign																		
resourceId	INTEGER	1234	ID of resource representing the customer to reassign to																		
lirId	INTEGER	1234	The ProVision id of the LIR to use for reassignment																		
entityHandle	STRING	CONNE-81	The Org ID for the LIR.																		
Optional Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>netName</td> <td>STRING</td> <td>NET-ACME-67-221-244-0-28</td> <td>Optional name for the network to override the default. The default net name Name Prefix and IP address for the block.</td> </tr> </tbody> </table>	Name	Type	Example	Description	netName	STRING	NET-ACME-67-221-244-0-28	Optional name for the network to override the default. The default net name Name Prefix and IP address for the block.												
Name	Type	Example	Description																		
netName	STRING	NET-ACME-67-221-244-0-28	Optional name for the network to override the default. The default net name Name Prefix and IP address for the block.																		
Example URL	/api/v1/api.php?target=ipam&action=simpleReassign&resourceId=121&blockId=31559&lirId=95&entityHandle=CONNE-81&&netNa																				

IPAM API Calls Subject to Change:

Calls below this point are subject to change, and are not recommended for use in production code.

Get Attribute List									
URL	/api/v1/api.php?target=ipam&action=getAttributeLists								
Description	Returns a list of attributes								
Returns	<p>Examples:</p> <table border="1"> <tr> <td>SUCCESSFUL</td> <td>{ "asns": [], "masks": ["24"], "rirs": ["1918"], "lirs": [], "tags": ["DHCP"], "codes": [], "vlans": [], "regions": ["Quito"], "resources": ["1", "slug": "quito-lab-1", "type": "dhcp_pool", "parent_id": "1", "category_id": null, "attr": { "_dhcp_type": "subnet", "_dhcp_"</td> </tr> <tr> <td>ERROR</td> <td>{ 'success':0, 'message':'error message' }</td> </tr> </table>	SUCCESSFUL	{ "asns": [], "masks": ["24"], "rirs": ["1918"], "lirs": [], "tags": ["DHCP"], "codes": [], "vlans": [], "regions": ["Quito"], "resources": ["1", "slug": "quito-lab-1", "type": "dhcp_pool", "parent_id": "1", "category_id": null, "attr": { "_dhcp_type": "subnet", "_dhcp_"	ERROR	{ 'success':0, 'message':'error message' }				
SUCCESSFUL	{ "asns": [], "masks": ["24"], "rirs": ["1918"], "lirs": [], "tags": ["DHCP"], "codes": [], "vlans": [], "regions": ["Quito"], "resources": ["1", "slug": "quito-lab-1", "type": "dhcp_pool", "parent_id": "1", "category_id": null, "attr": { "_dhcp_type": "subnet", "_dhcp_"								
ERROR	{ 'success':0, 'message':'error message' }								
Required Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>id</td> <td>INTEGER</td> <td>125</td> <td>ID of the IP block</td> </tr> </tbody> </table>	Name	Type	Example	Description	id	INTEGER	125	ID of the IP block
Name	Type	Example	Description						
id	INTEGER	125	ID of the IP block						
Optional Parameters	None								

Example URL	/api/v1/api.php?target=ipam&action=getAttributeLists&id=125
----------------	---

API Module - LIR

- LIR Management
 - Get
 - Delete

LIR Management

Get	
URL	/api/v1/api.php?target=lir&action=get
Description	Returns a list of LIRs
Returns	<p>Examples:</p> <pre>SUCCESSFUL { "success": 1, "message": "2 objects found", "data": [{ "id": "100", "name": "RIPE Test LIR", "slug": "ripe-test-lir", "entities": [{ "mnt_by": "mntner@email.com", "mnt_by_password": "password", "admin_c": "test-admin-c", "tech_c": "test-tech-c", "api_key": null }], "rir": "RIPE" }, { "id": "101", "name": "ARIN Test LIR", "slug": "arin-test-lir", "entities": [{ "org_handle": "TEST-10", "admin_poc": "TEST-ARIN", "net_poc": "TEST-ARIN", "abuse_poc": "", "net_name_prefix": "PRFX", "api_key": "API-XXXX-YYYY-ZZZZ-1234" }], "rir": "ARIN", "asn": "1000" }] } ERROR { "success": 0, "message": "error message" }</pre>
Example URL	/api/v1/api.php?target=lir&action=get

Delete					
URL	/api/v1/api.php?target=lir&action=delete&id=<ID>				
Description	Deletes an LIR				
Returns	<p>Examples:</p> <table border="1"> <tbody> <tr> <td>SUCCESSFUL</td> <td> <pre>{ "success": 1, "message": "LIR deleted." }</pre> </td> </tr> <tr> <td>ERROR</td> <td> <pre>{ "success":0, "message":"error message" }</pre> </td> </tr> </tbody> </table>	SUCCESSFUL	<pre>{ "success": 1, "message": "LIR deleted." }</pre>	ERROR	<pre>{ "success":0, "message":"error message" }</pre>
SUCCESSFUL	<pre>{ "success": 1, "message": "LIR deleted." }</pre>				
ERROR	<pre>{ "success":0, "message":"error message" }</pre>				
Example URL	/api/v1/api.php?target=lir&action=delete&id=100

Peering

getCommunications									
Base URL	/api/v1/api.php?target=peering&action=getCommunications								
Description	Returns all communication data on peers at a particular exchange.								
Returns	<p>Examples:</p> <table border="1"> <tr> <td>SUCCESSFUL</td> <td>{ "success":1, "message":"8 records found.", "data":[{"name":"1&1 Internet", "asn":"8560", "request_status":null, "qualified":null, "is_peer":false, "id":"2283", "log_data":[]}, {"name":"OV Communications", "asn":"7029", "request_status":null, "qualified":null, "is_peer":false, "id":"1820", "log_data":[]}, {"name":"nar Inc.)", "asn":"6461", "request_status":null, "qualified":null, "is_peer":false, "id":"541", "log_data":[]}, {"name":"tw telecom</td> </tr> <tr> <td>ERROR</td> <td>{ 'success':0, 'message':'error message' }</td> </tr> </table>	SUCCESSFUL	{ "success":1, "message":"8 records found.", "data":[{"name":"1&1 Internet", "asn":"8560", "request_status":null, "qualified":null, "is_peer":false, "id":"2283", "log_data":[]}, {"name":"OV Communications", "asn":"7029", "request_status":null, "qualified":null, "is_peer":false, "id":"1820", "log_data":[]}, {"name":"nar Inc.)", "asn":"6461", "request_status":null, "qualified":null, "is_peer":false, "id":"541", "log_data":[]}, {"name":"tw telecom	ERROR	{ 'success':0, 'message':'error message' }				
SUCCESSFUL	{ "success":1, "message":"8 records found.", "data":[{"name":"1&1 Internet", "asn":"8560", "request_status":null, "qualified":null, "is_peer":false, "id":"2283", "log_data":[]}, {"name":"OV Communications", "asn":"7029", "request_status":null, "qualified":null, "is_peer":false, "id":"1820", "log_data":[]}, {"name":"nar Inc.)", "asn":"6461", "request_status":null, "qualified":null, "is_peer":false, "id":"541", "log_data":[]}, {"name":"tw telecom								
ERROR	{ 'success':0, 'message':'error message' }								
Required Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>public_id</td> <td>INTEGER</td> <td>1</td> <td>The unique numerical identifier of the exchange to retrieve peering communication records for.</td> </tr> </tbody> </table>	Name	Type	Example	Description	public_id	INTEGER	1	The unique numerical identifier of the exchange to retrieve peering communication records for.
Name	Type	Example	Description						
public_id	INTEGER	1	The unique numerical identifier of the exchange to retrieve peering communication records for.						
Optional Parameters	None								
Example URL	/api/v1/api.php?target=peering&action=getCommunications&public_id=1								

getPeers	
URL	/api/v1/api.php?target=peering&action=getPeers
Description	Returns a list of all peers available at an exchange
Returns	<p>Examples:</p> <p>SUCCESSFUL: { "success":1, "message":"184 peers found.", "data":[{"id":"262", "public_id":"1", "asn":"8560", "name":"1&1 Internet", "qualified":true, "is_peer":0, "request_status":null, "info_prefixes":"100", "public_ips":[], "contacts":[], "log_data":[]}, {"id":"890", "public_id":"1", "asn":"8560", "name":"1&1 Internet", "qualified":true, "is_peer":0, "request_status":null, "info_prefixes":"100", "public_ips":[], "contacts":[], "log_data":[]}, {"id":"1676", "public_id":"1", "asn":"8560", "name":"1&1 Internet", "qualified":true, "is_peer":0, "request_status":null, "info_prefixes":"3000", "public_ips":[], "contacts":[], "log_data":[]}, {"id":"576", "public_id":"1", "asn":"8560", "name":"1&1 Internet", "qualified":true, "is_peer":0, "request_status":null, "info_prefixes":"200", "public_ips":[], "contacts":[], "log_data":[]}, {"id":"576", "public_id":"1", "asn":"8560", "name":"1&1 Internet", "qualified":true, "is_peer":0, "request_status":null, "info_prefixes":"3000", "public_ips":[], "contacts":[], "log_data":[]}, {"id":"4078", "public_id":"1", "asn":"8560", "name":"1&1 Internet", "qualified":true, "is_peer":0, "request_status":null, "info_prefixes":"60", "public_ips":[], "contacts":[], "log_data":[]}, {"id":"4078", "public_id":"1", "asn":"8560", "name":"1&1 Internet", "qualified":true, "is_peer":0, "request_status":null, "info_prefixes":"20000", "public_ips":[], "contacts":[], "log_data":[]}] }</p> <p>ERROR: { "success":1, "message":"No peers found." }</p>
Required Parameters	None

Optional Parameters				
	Name	Type	Example	Description
	public_id	INTEGER	1	The unique numerical identifier of the exchange to re
	id	INT	1	The unique numerical identifier of the peer in peering
	asn	INT	4436

	include_public_ips	BOOL	TRUE	Returns a list of all public facing IPs
	include_contacts	BOOL	TRUE	Returns a list of all contacts associated with peer(s)
	include_log_data	BOOL	TRUE	Returns a list of all log data associated with the peer
Example URL	/api/v1/api.php?target=peering&action=getPeers&public_id=1			

getRequests

URL	/api/v1/api.php?target=peering&action=getRequests
Description	Returns a list of all peering requests issued

Returns	<p>Examples: SUCCESSFUL: {"success":1,"message":"1 request found.", "data":{"id":"131","public_id":"5","source_participant_id":"2335","source_asn":"8038","peer_participant_id":"1418","peer_asr_ops@6connect.com","email_to":"nalinmk@gmail.com","subject":"Peering request from 6connect, Inc.", "body":"Peering,\n\n6conr locations.\n\nFacility, IP Address\nEquinix Ashburn - 206.126.236.68\nEquinix Palo Alto - 198.32.176.36\nEquinix Ashburn - LAN - 195.66.225.175\n\nSincerely,\nOperations\nops@6connect.com\n\n6connect, Inc. information:\nEquinix Palo Al http:\nWas8038.peeringdb.com\n\n","status":null,"created":"2014-04-23 10:31:33","modified":"2014-04-23 10:31:33"}} ERROR: {"success":1,"message":"No request found.", "data":{}}</p>								
Required Parameters	None								
Optional Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>peer_participant_id</td> <td>INTEGER</td> <td>1</td> <td>The numerical id of the peer</td> </tr> </tbody> </table>	Name	Type	Example	Description	peer_participant_id	INTEGER	1	The numerical id of the peer
Name	Type	Example	Description						
peer_participant_id	INTEGER	1	The numerical id of the peer						
Example URL	/api/v1/api.php?target=peering&action=getRequests&peer_participant_id=1								

getSessions

URL	/api/v1/api.php?target=peering&action=getSessions								
Description	Returns a list of all bgp peering sessions								
Returns	<p>Examples: SUCCESSFUL: {"success":1,"message":"1 sessions found.", "data":{"id":"51","source_asn":"32787","source_ipaddr":"1.2.3.4","resource_id":"422","resource_name":"ar1.inoc.com","peer Technologies","peer_participant_id":"2","peer_ipaddr":"206.126.236.102","peer_hostname":null,"peer_group":"group b","public_id":"Ashburn","ip_type":"ipv4","type":"Peer","state":"not configured","prfx_max":"20","prfx_received":null,"password":"0","note":null},}}</p> <p>ERROR: {"success":1,"message":"No peers found."}</p>								
Required Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>public_id</td> <td>INTEGER</td> <td>1</td> <td>The unique numerical identifier of the exchange to retrieve peering communicaiton records for.</td> </tr> </tbody> </table>	Name	Type	Example	Description	public_id	INTEGER	1	The unique numerical identifier of the exchange to retrieve peering communicaiton records for.
Name	Type	Example	Description						
public_id	INTEGER	1	The unique numerical identifier of the exchange to retrieve peering communicaiton records for.						

Optional Parameters	Name	Type	Example	Description
	id	INTEGER	41	
	public_id	INTEGER		
	source_asn	INTEGER		
	source_ipaddr	STRING		
	resource_id	INTEGER		
	peer_asn	INTEGER		
	peer_name	STRING		
	peer_participant_id	INTEGER		
	peer_ipaddr	STRING		
	peer_hostname	STRING		
	peer_group	STRING		
	password	INTEGER		
	type	STRING		
	state	STRING		
	prfx_max	INTEGER		
	prfx_received	INTEGER		
	ip_type	ENUM		enum('ipv4','ipv6') NOT NULL DEFAULT 'ipv4'
	note	STRING		
	created	TIMESTAMP		
modified	TIMESTAMP			
deleted	INTEGER			
public_id	INTEGER			

Example URL	/api/v1/api.php?target=peering&action=getPeers&public_id=1
-------------	--

addSession

URL	/api/v1/api.php?target=peering&action=addSession
Description	Adds a bgp session
Returns	<p>Examples:</p> <p>SUCCESSFUL: {"success":1,"message":"Session added: Amazon.com (AS8038V1.2.3.5) - (AS16509V206.126.236.68)","data":{"id":111,"source_asn":"8038","source_ipaddr":"1.2.3.5","resource_id":"422","resource_name":"n configured","prfx_max":"200","prfx_received":null,"password":"ace12345","note":"I'm a fancy note."}}</p> <p>ERROR: {"success":1,"message":"No request found.","data":[]}</p>
Required Parameters	None

Optional Parameters	Name	Type	Example	Description
	source_asn	INTEGER	1	The numerical id of the peer
	source_ipaddr	STRING		
	resource_id	INTEGER		
	peer_asn	INTEGER		
	peer_name	STRING		
	peer_participant_id	INTEGER		
	peer_ipaddr	STRING		
	peer_hostname	STRING		
	peer_group	STRING		
	public_id			
	type	STRING		
	ip_type	ENUM		enum('ipv4','ipv6')
	state	STRING		
	prfx_max	INTEGER		
note	STRING			
Example URL	/api/v1/api.php?target=peering&action=getRequests&peer_participant_id=1			

configureSession

URL	/api/v1/api.php?target=peering&action=configureSession								
Description	Configure a BGP session on the router								
Returns	<p>Examples:</p> <p>SUCCESSFUL:</p> <p>ERROR: {"success":0,"message":"Unable to authenticate "}</p>								
Required Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>session_id</td> <td>INTEGER</td> <td>1</td> <td></td> </tr> </tbody> </table>	Name	Type	Example	Description	session_id	INTEGER	1	
Name	Type	Example	Description						
session_id	INTEGER	1							

Optional Parameters	Name	Type	Example	Description
	session_id	INTEGER	1	The numerical id of the peer
	source_ipaddr	STRING		
	resource_id	INTEGER		
	peer_asn	INTEGER		
	peer_name	STRING		
	peer_participant_id	INTEGER		
	peer_ipaddr	STRING		
	peer_hostname	STRING		
	peer_group	STRING		
	public_id			
	type	STRING		
	ip_type	ENUM		enum('ipv4','ipv6')
	state	STRING		
	prfx_max	INTEGER		
note	STRING			
Example URL	/api/v1/api.php?target=peering&action=configureSession&session_id=51&username=&config=conf+t%0A%0Arouter+bgp+32787%			

deleteSession	
URL	/api/v1/api.php?target=peering&action=deleteSession
Description	Delete sessions matching criteria
Returns	Examples: SUCCESSFUL: {"success":1,"message":"1 sessions deleted."} ERROR: {"success":0,"message":"No sessions found to delete."}
Required Parameters	None

Optional Parameters				
	Name	Type	Example	Description
	id	INTEGER	41	
	public_id	INTEGER		
	source_asn	INTEGER		
	source_ipaddr	STRING		
	resource_id	INTEGER		
	peer_asn	INTEGER		
	peer_name	STRING		
	peer_participant_id	INTEGER		
	peer_ipaddr	STRING		
	peer_hostname	STRING		
	peer_group	STRING		
	password	INTEGER		
	type	STRING		
	state	STRING		
	prfx_max	INTEGER		
	prfx_received	INTEGER		
	ip_type	ENUM		enum('ipv4','ipv6') NOT NULL DEFAULT 'ipv4'
	note	STRING		
	created	TIMESTAMP		
	modified	TIMESTAMP		
	deleted	INTEGER		
	public_id	INTEGER		
Example URL	/api/v1/api.php?target=peering&action=deleteSession&id=171			

updateSession

URL	/api/v1/api.php?target=peering&action=updateSession
Description	Updates session values with any new values specified
Returns	<p>Examples:</p> <p>SUCCESSFUL:{"success":1,"message":"Session updated: 123.net (AS32787V1.2.3.4) - (AS12129V206.126.236.70)","data":{"id":"41","source_asn":"32787","source_ipaddr":"1.2.3.4","resource_id":"422","resource_name":"a","public_id":"1","public_name":"Equinix Ashburn","ip_type":"ipv4","type":"Peer","state":"not configured","prfx_max":"10","prfx_recei</p> <p>ERROR:</p>
Required Parameters	None

Optional Parameters	Name	Type	Example	Description
	id	INTEGER	41	
	public_id	INTEGER		
	source_asn	INTEGER		
	source_ipaddr	STRING		
	resource_id	INTEGER		
	peer_asn	INTEGER		
	peer_name	STRING		
	peer_participant_id	INTEGER		
	peer_ipaddr	STRING		
	peer_hostname	STRING		
	peer_group	STRING		
	password	INTEGER		
	type	STRING		
	state	STRING		
	prfx_max	INTEGER		
	prfx_received	INTEGER		
	ip_type	ENUM		enum('ipv4','ipv6') NOT NULL DEFAULT 'ipv4'
	note	STRING		
	created	TIMESTAMP		
modified	TIMESTAMP			
deleted	INTEGER			
public_id	INTEGER			
Example URL	/api/v1/api.php?target=peering&action=updateSession¬e=Adding+an+awesome+note.&peer_group=group+a			

resetPeerStatus

URL	/api/v1/api.php?target=peering&action=resetPeerStatus
Description	
Returns	<p>Examples:</p> <p>SUCCESSFUL: {"success":1,"message":"1&1 Internet status reset","data":{"id":"262","public_id":"1","asn":"8560","name":"1&1 Internet","qualified":true,"is_peer":0,"request_status":"none","info_prefixes":null,"public_ips":[],"contacts":[],"log_data":{"message":"1 status reset","time":"2014-05-22 23:14:54","request_id":null,"session_id":null,"public_id":"1"},"message":"Peer status reset","time":"2014-05-22 23:14:18","request_id":null,"session_id":null,"public_id":"1"},"message":"Session deleted: 1&1 Internet (AS32787V1.2.3.4) - (AS8560V206.126.236.200)","time":"2014-05-22 22:39:43","request_id":null,"session_id":"71","public_id":"1"},"message":"Request sent: ","time":"2014-04-12 13:24:43","request_id":"121","session_id":null,"public_id":"1"},"message":"Session added: 1&1 Internet (AS32787V1.2.3.4) - (AS8560V206.126.236.200)","time":"2014-04-07 11:32:37","request_id":null,"session_id":"71","public_id":"1"}}}</p> <p>ERROR: {"success":0,"message":"Could not find peer matching parameters"}</p>

Required Parameters	Name	Type	Example	Description
	participant_id	INTEGER	262	The id of the peer in from the peeringDB peerParticipants table.
	public_id	INTEGER	1	The id of the exchange point from the peeringDB mgmtPublics table.
Optional Parameters	None			
Example URL	/api/v1/api.php?target=peering&action=resetPeerStatus&participant_id=262&public_id=1			

sendRequest

URL	/api/v1/api.php?target=peering&action=sendRequest			
Description	Send a peering request (email) to a prospective peer. This will be deprecated in the next version for a simpler call, strongly suggest			
Returns	<p>Examples:</p> <p>SUCCESSFUL: {"success":1,"message":"Request sent","data":{"id":"922","public_id":"1","asn":"10933","name":"ATX Communicatio Inc.,"qualified":true,"is_peer":0,"request_status":"sent","info_prefixes":null,"public_ips":[],"contacts":[],"log_data":{"message":"Requ 16:59:01","request_id":"181","session_id":null,"public_id":"1"},"message":"Request sent to ","time":"2014-05-27 16:49:30","request_</p> <p>ERROR: {"success":0,"message":"Internal error"}</p>			
Required Parameters	Name	Type	Example	Description
	public_id	INTEGER		
	peer_participant_id	INTEGER		
	source_participant_id	INTEGER		
	peer_name	STRING		
	peer_asn	INTEGER		
	email_from	STRING	262	
	email_to	STRING	1	
	subject	STRING		
	body	STRING		
	type	ENUM	html	enum('text','html')
status	ENUM	sent	enum('sent','accepted','rejected')	
Optional Parameters	None			
Example URL	https://ops.6connect.com/peering-demo/api/v1/api.php?target=peering&action=sendRequest&peer_participant_id=1909&peer_asn=&public_id=1&type=text&email_from=ops%406connect.com&email_to=operations%40as28929.net&cc=&bcc=&subject=Peering+re &body=%0D%0APeering%2C%0D%0A%0D%0A6connect%2C+Inc.%2C+8038%2C+would+like+to+peer+with+ASDASD+srl+at+o			

sendEmail

URL	/api/v1/api.php?target=peering&action=sendEmail			
Description	Send a peering request (email) to a prospective peer. This will be deprecated in the next version for a simpler call, strongly suggest against using.			
Returns	<p>Examples:</p> <p>SUCCESSFUL:</p> <p>ERROR:</p>			

Required Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>participant_id</td> <td>INTEGER</td> <td>262</td> <td></td> </tr> <tr> <td>public_id</td> <td>INTEGER</td> <td>1</td> <td></td> </tr> </tbody> </table>	Name	Type	Example	Description	participant_id	INTEGER	262		public_id	INTEGER	1	
Name	Type	Example	Description										
participant_id	INTEGER	262											
public_id	INTEGER	1											
Optional Parameters	None												
Example URL													

updatePeer													
URL	/api/v1/api.php?target=peering&action=updatePeer												
Description													
Returns	Examples: SUCCESSFUL: ERROR:												
Required Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>participant_id</td> <td>INTEGER</td> <td>262</td> <td></td> </tr> <tr> <td>public_id</td> <td>INTEGER</td> <td>1</td> <td></td> </tr> </tbody> </table>	Name	Type	Example	Description	participant_id	INTEGER	262		public_id	INTEGER	1	
Name	Type	Example	Description										
participant_id	INTEGER	262											
public_id	INTEGER	1											
Optional Parameters	None												
Example URL													

API Module - Resource

- Resources
 - get
 - add
 - update
 - delete

Resources

get																																					
URL	/api/v1/api.php?target=resource&action=get																																				
Description	Get a resource or resources																																				
Returns	<p>Examples: SUCCESSFUL: <code>{"success":1,"message":"Search successful","data":[{"id":"57","name":"2nd Email","slug":"6c-contact-email2","type":"field","parent_id":"1","category_id":null,"attr":[]}]}</code> ERROR: <code>{"success":0,"message":"Search failed"}</code></p>																																				
Optional Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Notes/Example</th> </tr> </thead> <tbody> <tr> <td>name</td> <td>STRING</td> <td>Name of the resource. Example: 6Connect, Inc.</td> </tr> <tr> <td>slug</td> <td>STRING</td> <td>The unique URL friendly name of the resource. Example: 6connect-inc</td> </tr> <tr> <td>type</td> <td>STRING</td> <td>Type of resource (eg. <i>entry</i>, <i>field</i>, <i>category</i>)</td> </tr> </tbody> </table> <p>At most, one of the following:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Notes/Example</th> </tr> </thead> <tbody> <tr> <td>id</td> <td>INTEGER</td> <td>Get the resource which has this ID</td> </tr> <tr> <td>resource__in</td> <td>ARRAY</td> <td>Get any resource which has any of these IDs Syntax: <code>&resource__in[]=1771&resource__in[]=14238</code> (Each resource id you wish to search over gets its own phrase.)</td> </tr> <tr> <td>resource__not_in</td> <td>ARRAY</td> <td>Get all the resources which do not have any of these IDs Syntax: <code>&resource__not_in[]=1771&resource__not_in[]=14238</code> (Each resource id you wish to exclude gets its own phrase.)</td> </tr> </tbody> </table> <p>At most, one of the following:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Notes/Example</th> </tr> </thead> <tbody> <tr> <td>parent_id</td> <td>INTEGER</td> <td>Get the resources whose parent has this ID</td> </tr> <tr> <td>parent__in</td> <td>ARRAY</td> <td>Get any resource whose parents have any of these IDs. Syntax: <code>&parent__in[]=162&parent__in[]=299</code> (Each parent id you wish to search over gets its own phrase.)</td> </tr> <tr> <td>parent__not_in</td> <td>ARRAY</td> <td>Get all resources whose parents do not have any of these IDs Syntax: <code>&parent__not_in[]=1771&parent__not_in[]=14238</code> (Each parent id you wish to exclude gets its own phrase.)</td> </tr> </tbody> </table>	Name	Type	Notes/Example	name	STRING	Name of the resource. Example: 6Connect, Inc.	slug	STRING	The unique URL friendly name of the resource. Example: 6connect-inc	type	STRING	Type of resource (eg. <i>entry</i> , <i>field</i> , <i>category</i>)	Name	Type	Notes/Example	id	INTEGER	Get the resource which has this ID	resource__in	ARRAY	Get any resource which has any of these IDs Syntax: <code>&resource__in[]=1771&resource__in[]=14238</code> (Each resource id you wish to search over gets its own phrase.)	resource__not_in	ARRAY	Get all the resources which do not have any of these IDs Syntax: <code>&resource__not_in[]=1771&resource__not_in[]=14238</code> (Each resource id you wish to exclude gets its own phrase.)	Name	Type	Notes/Example	parent_id	INTEGER	Get the resources whose parent has this ID	parent__in	ARRAY	Get any resource whose parents have any of these IDs. Syntax: <code>&parent__in[]=162&parent__in[]=299</code> (Each parent id you wish to search over gets its own phrase.)	parent__not_in	ARRAY	Get all resources whose parents do not have any of these IDs Syntax: <code>&parent__not_in[]=1771&parent__not_in[]=14238</code> (Each parent id you wish to exclude gets its own phrase.)
Name	Type	Notes/Example																																			
name	STRING	Name of the resource. Example: 6Connect, Inc.																																			
slug	STRING	The unique URL friendly name of the resource. Example: 6connect-inc																																			
type	STRING	Type of resource (eg. <i>entry</i> , <i>field</i> , <i>category</i>)																																			
Name	Type	Notes/Example																																			
id	INTEGER	Get the resource which has this ID																																			
resource__in	ARRAY	Get any resource which has any of these IDs Syntax: <code>&resource__in[]=1771&resource__in[]=14238</code> (Each resource id you wish to search over gets its own phrase.)																																			
resource__not_in	ARRAY	Get all the resources which do not have any of these IDs Syntax: <code>&resource__not_in[]=1771&resource__not_in[]=14238</code> (Each resource id you wish to exclude gets its own phrase.)																																			
Name	Type	Notes/Example																																			
parent_id	INTEGER	Get the resources whose parent has this ID																																			
parent__in	ARRAY	Get any resource whose parents have any of these IDs. Syntax: <code>&parent__in[]=162&parent__in[]=299</code> (Each parent id you wish to search over gets its own phrase.)																																			
parent__not_in	ARRAY	Get all resources whose parents do not have any of these IDs Syntax: <code>&parent__not_in[]=1771&parent__not_in[]=14238</code> (Each parent id you wish to exclude gets its own phrase.)																																			

At most, one of the following:

Name	Type	Notes/Example
category_id	INTEGER	Get the resources of the category that has this ID
category__in	ARRAY	Get any resources whose categories have any of these IDs. Syntax: &category__in[]=11002&category__in[]=11003 (Each category id you wish to search over gets its own phrase.)
category__not_in	ARRAY	Get the resources of all the categories that do not have any of these IDs Syntax: &parent__not_in[]=11002&parent__not_in[]=11003 (Each category id you wish to exclude gets its own phrase.)

You can set the order of the results by setting the STRING value of the parameter **orderby** to one of the following :

- none
- id
- name (*default*)
- slug
- type
- parent_id
- date
- resource__in (*preserve order given in the resource__in array*)

You can set the direction of the ordering of the results by setting the STRING value of the parameter **order** to one of the following :

- ASC (*default*)
- DESC

You can further limit the results based on attributes the resources may have:

Name	Type	Notes/Example
attr_key	STRING	The name of the attribute. Example: network-fqdn
attr_value	STRING	The value of any attribute, or if attr_key is specified, the value of the attribute defined in attr_key.
attr_compare	STRING	If both attr_key and attr_value are given, the results are by default compared based on the value given as attr_value being equal to the value stored in the database. You can optionally change this by setting the STRING value of attr_compare to one of the following: <ul style="list-style-type: none"> • = (<i>default</i>) • != • > • >= • < • <= • LIKE • NOT LIKE • IN • NOT IN • BETWEEN • NOT BETWEEN

When attr_compare is set to IN, NOT IN, BETWEEN, NOT BETWEEN, then attr_value must either be an array or a comma separated string.

You can search on multiple attributes by including an array of attribute options:

Name	Type	Notes/Example
attributes	ARRAY	<pre>var data = { "type": "entry", "attributes": [{ "attr_key": "_section", "attr_value": "105", }, { "attr_key": "address-mail-state", "attr_value": "CA", }], "resources_per_page": 10 }</pre>

You can restrict the range of the resources returned.

Name	Type	Notes/Example
resources_per_page	INTEGER	How many resources to return.
offset	INTEGER	How many resources to offset (the initial resource is 0, not 1).
paged	INTEGER	The page to return (starts at 1, not 0). This parameter is provided for convenience and is used to calculate the offset where: $offset=(paged-1)*resources_per_page$

Example URL
/api/v1/api.php?target=resource&action=get&id=7

add

URL
/api/v1/api.php?target=resource&action=add

Description
Add a resource.

Returns
Examples:
 /api/v1/api.php?target=resource&action=add&meta[name]=apitest&meta[type]=entry&meta[section]=firewall&fields[network-fqdn][]=www.example.com
 SUCCESSFUL: {"success":1,"message":"Resource added","data":{"id":1077,"name":"apitest","slug":"apitest","type":"entry","parent_id":1,"category_id":"NULL","attr":{"_section":"70"},"ne
 /api/v1/api.php?target=resource&action=add&meta[name]=apitest&meta[type]=entry&fields[network-fqdn][]=www.example.com
 ERROR:{"success":0,"message":"Entries must be assigned to a section"}

Required Parameters

Name	Type	Notes/Example
meta[name]	STRING	Name of the resource
meta[type]	STRING	Type of resource (entry, section, field, etc.)

Optional Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Notes/Example</th> </tr> </thead> <tbody> <tr> <td>meta[parent_id]</td> <td>INTEGER</td> <td>ID of the parent resource</td> </tr> <tr> <td>meta[category_id]</td> <td>INTEGER</td> <td>ID of the category</td> </tr> </tbody> </table>	Name	Type	Notes/Example	meta[parent_id]	INTEGER	ID of the parent resource	meta[category_id]	INTEGER	ID of the category
Name	Type	Notes/Example								
meta[parent_id]	INTEGER	ID of the parent resource								
meta[category_id]	INTEGER	ID of the category								
Required Parameters (meta[type] = entry)	<p>One of the following:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Notes/Example</th> </tr> </thead> <tbody> <tr> <td>meta[section_id]</td> <td>INTEGER</td> <td>ID of the section that the entry will be assigned to</td> </tr> <tr> <td>meta[section]</td> <td>STRING</td> <td>Slug of the section that the entry will be assigned to</td> </tr> </tbody> </table>	Name	Type	Notes/Example	meta[section_id]	INTEGER	ID of the section that the entry will be assigned to	meta[section]	STRING	Slug of the section that the entry will be assigned to
Name	Type	Notes/Example								
meta[section_id]	INTEGER	ID of the section that the entry will be assigned to								
meta[section]	STRING	Slug of the section that the entry will be assigned to								
Optional Parameters (meta[type] = entry)	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Notes/Example</th> </tr> </thead> <tbody> <tr> <td>fields[]</td> <td>ARRAY</td> <td> <p>Entry field values (for fields that have already been assigned to the section) can be populated when</p> <p>The format is field[field-slug][field-instance]. The field instance is used to keep track of which field for it.</p>								
meta[custom_id]	STRING	A custom ID for the entry. In the past this has been called the Resource Holder ID or Customer ID. I								
Required Parameters (meta[type] = field)	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Notes/Example</th> </tr> </thead> <tbody> <tr> <td>meta[field_type]</td> <td>STRING</td> <td> Type of field <ul style="list-style-type: none"> • text • textarea • radios • checkboxes • choicebox </td> </tr> </tbody> </table>	Name	Type	Notes/Example	meta[field_type]	STRING	Type of field <ul style="list-style-type: none"> • text • textarea • radios • checkboxes • choicebox 			
Name	Type	Notes/Example								
meta[field_type]	STRING	Type of field <ul style="list-style-type: none"> • text • textarea • radios • checkboxes • choicebox 								

Optional Parameters (meta[type] = field)	Name	Type	Notes/Example
	meta[help_block]	STRING	Fields can have a line of text under them with instructions
	meta[options]	ARRAY	Fields of type radios, checkboxes, or choicebox can have multiple options. This could be multiple re meta[type]=field&meta[name]=Colors&meta[field_type]=choicebox&meta[options][]=Blue&meta[opt Will create a choicebox with dropdown options of Blue and Green.

Required Parameters (meta[type] = gadgets)	Name	Type	Notes/Example
	gadgets[x][uuid]	INTEGER	x: The nth gadget being described in the call ('0' for the first gadget, '1' for the second, and so on). uuid: User-generated ID of the gadget to be created.
	gadgets[x][code]	STRING	x: The nth gadget being described in the call ('0' for the first gadget, '1' for the second, and so on). code: Slug of the gadget code to be created. List of valid Gadget codes: <ul style="list-style-type: none"> • Contact Info: "_contact_info" • Contacts: "_contacts" • DHCP Server: "_dhcp_server" • DNS: "_dns" • Document Storage: "_document_storage" • IPAM: "_ipam" • Peer Groups: "_peering_peer_groups" • Peering Sessions: "_peering_sessions" • VRFs: "_peering_vrfs" • Resource Linkage: "_resource_linkage" • Resource View: "_resource_view" • Reverse API Console: "_reverse_api" • Tech Info: "_tech_info"

Example - Adding the IPAM Gadget to a Section:

api.php?target=resource&action=add&meta[type]=section&meta[name]=TestSection_1&meta[parent_id]=1&gadgets[0][uuid]=uuid-

update			
URL	/api/v1/api.php?target=resource&action=update		
Description	Update a resource.		
Returns	Examples: SUCCESSFUL: {"success":1,"message":"Resource Updated","data":{"id":"1055","name":"87-child-1","slug":"87-child-1","type":"entry","parent_id":"87","category_id":"65","attr":{"_sectio ERROR: {"success":0,"message":"No resource found with ID: 1079"}		
Required Parameters	Name	Type	Notes/Example
	meta[id]	INTEGER	ID of resource
	meta[type]	STRING	Type of resource (entry, section, field, ect)
Optional Parameters (meta[type] = entry)	Name	Type	Notes/Example
	fields[]	ARRAY	See "add" documentation

Optional Parameters (meta[type] = section)	Name	Type	Notes/Example
	fields[]	ARRAY	<p>The fields value should be all the fields that are assigned to the section. Giving an empty array as the fields va</p> <p>The format is:</p> <pre>fields[position][key]</pre> <p>The position value is the position that the field will appear in (0 is first). The position value must always be incl</p> <pre>fields[0][id]=2 fields[0][slug]=asset-serial-number fields[0][help_block]=something fields[0][new]=false</pre> <ul style="list-style-type: none"> ▪ Either the id or the slug is required, not both. ▪ When the "new" parameter is not included, FALSE is assumed <p>If you want to create a new field and assign it to the section, use a format like this:</p> <pre>fields[10][name]=TextArea fields[10][field_type]=textarea fields[10][new]=true</pre>

delete							
URL	/api/v1/api.php?target=resource&action=delete						
Description	Delete a resource.						
Returns	<p>Examples:</p> <p>SUCCESSFUL: {"success":1,"message":"Resource deleted."}</p> <p>ERROR: {"success":0,"message":"No resource found with ID: 57"}</p>						
Required Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Notes/Example</th> </tr> </thead> <tbody> <tr> <td>id</td> <td>INTEGER</td> <td>ID of the resource</td> </tr> </tbody> </table>	Name	Type	Notes/Example	id	INTEGER	ID of the resource
Name	Type	Notes/Example					
id	INTEGER	ID of the resource					
Optional Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Notes/Example</th> </tr> </thead> <tbody> <tr> <td>recursive</td> <td>BOOL</td> <td>When 1, deletes parent and child entries for the resource</td> </tr> </tbody> </table> <p>A recursive delete will delete all resources, which are permitted to be deleted, from the bottom up.</p> <p>Imagine the following hierarchy:</p> <pre> A B1 B2 C11 C12 C21 C22 </pre> <p>If a recursive delete is performed on A, but C21 is not deletable, the following resources would still be deleted: (B1, C11, C12, C22).</p> <p>B2 would not be deleted because it depends on C21 and A would not be deleted because it depends on B2.</p>	Name	Type	Notes/Example	recursive	BOOL	When 1, deletes parent and child entries for the resource
Name	Type	Notes/Example					
recursive	BOOL	When 1, deletes parent and child entries for the resource					
Example URL	/api/v1/api.php?target=resource&action=delete&id=57						

API Module - VLAN

- getById
- getDomains
- enable
- addDomain
- getAvailable
- get
- deleteDomain
- updateDomain
- update
- removeTags
- addTags
- smartAssign

getById									
URL	api/v1/api.php?target=vlan&action=getById								
Description	get information of a vlan								
Returns	<p>Examples</p> <table border="1"> <tr> <td>SUCCESSFUL</td> <td><pre>{ "success":1, "message":"1 VLAN found. ", "data":{"id":"11190","vlan":"176","domain_id":"1","resource_id":null,"name":"","domain_name":"DefaultDomain" }</pre></td> </tr> <tr> <td>ERROR</td> <td><pre>{ "success":0, "message":"error message" }</pre></td> </tr> </table>	SUCCESSFUL	<pre>{ "success":1, "message":"1 VLAN found. ", "data":{"id":"11190","vlan":"176","domain_id":"1","resource_id":null,"name":"","domain_name":"DefaultDomain" }</pre>	ERROR	<pre>{ "success":0, "message":"error message" }</pre>				
SUCCESSFUL	<pre>{ "success":1, "message":"1 VLAN found. ", "data":{"id":"11190","vlan":"176","domain_id":"1","resource_id":null,"name":"","domain_name":"DefaultDomain" }</pre>								
ERROR	<pre>{ "success":0, "message":"error message" }</pre>								
Required Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>id</td> <td>INTEGER</td> <td>11190</td> <td>ID of the VLAN</td> </tr> </tbody> </table>	Name	Type	Example	Description	id	INTEGER	11190	ID of the VLAN
Name	Type	Example	Description						
id	INTEGER	11190	ID of the VLAN						
Optional Parameters	None								
Example URL	api/v1/api.php?target=vlan&action=getById&id=11190								

getDomains					
URL	api/v1/api.php?target=vlan&action=getDomains				
Description	get list and info of all domains or a specific domain. When specifying the domain the results will include tag info				
Returns	<p>Examples</p> <table border="1"> <tr> <td>SUCCESSFUL</td> <td><pre>{ "success":1, "message":"6 Domains found. ", "data":{"id":"1","domain":"DefaultDomain","attr_6c":{"range":"S","restricted":[1,1002,1003,1004,1005]},"vlans":{" 6connect.com","attr_6c":{"range":"S","restricted":[1,1002,1003,1004,1005]},"vlans":{"id":"19","vlan":"10","name": ... {"id":"12755","vlan":"70","name":""},"id":"12756","vlan":"71","name":""},"id":"12757","vlan":"72","name":""},"id":"1 </pre></td> </tr> <tr> <td>ERROR</td> <td><pre>{ "success":0, "message":"error message" }</pre></td> </tr> </table>	SUCCESSFUL	<pre>{ "success":1, "message":"6 Domains found. ", "data":{"id":"1","domain":"DefaultDomain","attr_6c":{"range":"S","restricted":[1,1002,1003,1004,1005]},"vlans":{" 6connect.com","attr_6c":{"range":"S","restricted":[1,1002,1003,1004,1005]},"vlans":{"id":"19","vlan":"10","name": ... {"id":"12755","vlan":"70","name":""},"id":"12756","vlan":"71","name":""},"id":"12757","vlan":"72","name":""},"id":"1 </pre>	ERROR	<pre>{ "success":0, "message":"error message" }</pre>
SUCCESSFUL	<pre>{ "success":1, "message":"6 Domains found. ", "data":{"id":"1","domain":"DefaultDomain","attr_6c":{"range":"S","restricted":[1,1002,1003,1004,1005]},"vlans":{" 6connect.com","attr_6c":{"range":"S","restricted":[1,1002,1003,1004,1005]},"vlans":{"id":"19","vlan":"10","name": ... {"id":"12755","vlan":"70","name":""},"id":"12756","vlan":"71","name":""},"id":"12757","vlan":"72","name":""},"id":"1 </pre>				
ERROR	<pre>{ "success":0, "message":"error message" }</pre>				
Required Parameters	None				

Optional Parameters	Name	Type	Example	Description
	id	INTEGER	2	ID of the domain
Example URL	api/v1/api.php?target=vlan&action=getDomains&id=2			

enable				
URL	api/v1/api.php?target=vlan&action=enable			
Description	enable vlans in a domain			
Returns	Examples			
	SUCCESSFUL	{"success":1,"message":"Success. ","data":"3 in request (0 were found already namedVavailable and 3 found as unavailable). 3 VLANs have been updated to unnamed available entries."}		
	ERROR	{"success":0,"message":"error message" }		
Required Parameters	Name	Type	Example	Description
	domainId	INTEGER	1	the domain ID in the domain table
	vlan	INTEGER or STRING	18,19,20	vlan for this domain that we want enabled
	Optional Parameters	None		
Example URL	api/v1/api.php?target=vlan&action=enable&domainId=1&vlan=18,19,20			

addDomain				
URL	api/v1/api.php?target=vlan&action=addDomain			
Description	add a domain			
Returns	Examples			
	SUCCESSFUL	{"success":1,"message":"domain 10 added","id":10,"data":{"id":"10","domain":"sdfasfaf","attr_6c":{"range":"S","restricted":[1,1002,1003,1004,1005]},"		
	ERROR	{"success":0,"message":"error message" }		
Required Parameters	Name	Type	Example	Description
	domain	STRING	6connect.com	Name to call new domain
	range	STRING	S	'S' or 'E', depending on VLAN range: extended or standard
	Optional Parameters	None		
Example URL	api/v1/api.php?target=vlan&action=addDomain&domain=6connect.com&range=S			

getAvailable				
URL	api/v1/api.php?target=vlan&action=getAvailable			

Description	get VLANs in a domain that have not been named yet (even names that are "", or just uses their number as a name)																		
Returns	<p>Examples</p> <table border="1"> <tr> <td>SUCCESSFUL</td> <td colspan="3">{"success":1,"message":"16 VLANs found.", "data":{"1":{"2":null,"3":null,"4":null,"5":null,"6":null,"7":null,"8":null,"9":null,"12":null,"13":null,"15":null,"16":null,"17":null}}</td> </tr> <tr> <td>ERROR</td> <td colspan="3">{ "success":0, "message":"error message" }</td> </tr> </table>			SUCCESSFUL	{"success":1,"message":"16 VLANs found.", "data":{"1":{"2":null,"3":null,"4":null,"5":null,"6":null,"7":null,"8":null,"9":null,"12":null,"13":null,"15":null,"16":null,"17":null}}			ERROR	{ "success":0, "message":"error message" }										
SUCCESSFUL	{"success":1,"message":"16 VLANs found.", "data":{"1":{"2":null,"3":null,"4":null,"5":null,"6":null,"7":null,"8":null,"9":null,"12":null,"13":null,"15":null,"16":null,"17":null}}																		
ERROR	{ "success":0, "message":"error message" }																		
Required Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>domainId</td> <td>INTEGER or STRING</td> <td>'1,2'</td> <td>ID of the domains to search for</td> </tr> </tbody> </table>			Name	Type	Example	Description	domainId	INTEGER or STRING	'1,2'	ID of the domains to search for								
Name	Type	Example	Description																
domainId	INTEGER or STRING	'1,2'	ID of the domains to search for																
Optional Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>tags</td> <td>INTEGER or STRING</td> <td>'111,112'</td> <td>ID of the tags to search for</td> </tr> <tr> <td>min</td> <td>INTEGER</td> <td>24</td> <td>VLAN to start search</td> </tr> <tr> <td>max</td> <td>INTEGER</td> <td>200</td> <td>VLAN to end search</td> </tr> </tbody> </table>			Name	Type	Example	Description	tags	INTEGER or STRING	'111,112'	ID of the tags to search for	min	INTEGER	24	VLAN to start search	max	INTEGER	200	VLAN to end search
Name	Type	Example	Description																
tags	INTEGER or STRING	'111,112'	ID of the tags to search for																
min	INTEGER	24	VLAN to start search																
max	INTEGER	200	VLAN to end search																
Example URL	api/v1/api.php?target=vlan&action=getAvailable&domainId=1&tags=111,112&min=2&max=23																		

get																			
URL	api/v1/api.php?target=vlan&action=get																		
Description	Searches enabled VLANs. When not given options, returns all enabled VLANs. Note: an optional parameter, unavailable, is used to																		
Returns	<p>Examples</p> <table border="1"> <tr> <td>SUCCESSFUL</td> <td colspan="3">{"success":1,"message":"2 domains found.", "data":{"1":{"id":"1","domain":"DefaultDomain","attr_6c":null,"attr_custom":null,"vlans":{"id":"4","vlan":"105","name":"VLAN105"}}}}</td> </tr> <tr> <td>ERROR</td> <td colspan="3">{ "success":0, "message":"error message" }</td> </tr> </table>			SUCCESSFUL	{"success":1,"message":"2 domains found.", "data":{"1":{"id":"1","domain":"DefaultDomain","attr_6c":null,"attr_custom":null,"vlans":{"id":"4","vlan":"105","name":"VLAN105"}}}}			ERROR	{ "success":0, "message":"error message" }										
SUCCESSFUL	{"success":1,"message":"2 domains found.", "data":{"1":{"id":"1","domain":"DefaultDomain","attr_6c":null,"attr_custom":null,"vlans":{"id":"4","vlan":"105","name":"VLAN105"}}}}																		
ERROR	{ "success":0, "message":"error message" }																		
Required Parameters	None																		
Optional Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>unavailable</td> <td>STRING</td> <td>true</td> <td>Will return available, instead of enabled, VLANs</td> </tr> <tr> <td>domainId</td> <td>INTEGER</td> <td>1</td> <td>domain ID</td> </tr> <tr> <td>id</td> <td>INTEGER</td> <td>21</td> <td>VLAN ID in the vlan table</td> </tr> </tbody> </table>			Name	Type	Example	Description	unavailable	STRING	true	Will return available, instead of enabled, VLANs	domainId	INTEGER	1	domain ID	id	INTEGER	21	VLAN ID in the vlan table
Name	Type	Example	Description																
unavailable	STRING	true	Will return available, instead of enabled, VLANs																
domainId	INTEGER	1	domain ID																
id	INTEGER	21	VLAN ID in the vlan table																
Example URL	api/v1/api.php?target=vlan&action=get&id=4&unavailable=true																		

deleteDomain	
URL	api/v1/api.php?target=vlan&action=deleteDomain
Description	Deletes a VLAN domain.

Returns	<p>Examples</p> <table border="1"> <tr> <td>SUCCESSFUL</td> <td><code>{"success":1,"message":"Domain #7 successfully deleted."}</code></td> </tr> <tr> <td>ERROR</td> <td><code>{"success":0,"message":"error message" }</code></td> </tr> </table>	SUCCESSFUL	<code>{"success":1,"message":"Domain #7 successfully deleted."}</code>	ERROR	<code>{"success":0,"message":"error message" }</code>				
SUCCESSFUL	<code>{"success":1,"message":"Domain #7 successfully deleted."}</code>								
ERROR	<code>{"success":0,"message":"error message" }</code>								
Required Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>domainId</td> <td>INTEGER</td> <td>7</td> <td>domain ID</td> </tr> </tbody> </table>	Name	Type	Example	Description	domainId	INTEGER	7	domain ID
Name	Type	Example	Description						
domainId	INTEGER	7	domain ID						
Optional Parameters	None								
Example URL	api/v1/api.php?target=vlan&action=deleteDomain&domainId=7								

updateDomain

URL	api/v1/api.php?target=vlan&action=updateDomain												
Description	Updates a VLAN domain.												
Returns	<p>Examples</p> <table border="1"> <tr> <td>SUCCESSFUL</td> <td><code>{"success":1,"message":"Domain 2 updated","id":"2","data":{"id":"2","domain":"44.6connect.com","attr_6c":{"range":"S","restricted":[1,1002,1003,1004],"1002":null,"1003":null,"1004":null,"1005":null},"type":"domain","util":{"S":{"used":11,"total":1000}}}}</code></td> </tr> <tr> <td>ERROR</td> <td><code>{"success":0,"message":"error message" }</code></td> </tr> </table>	SUCCESSFUL	<code>{"success":1,"message":"Domain 2 updated","id":"2","data":{"id":"2","domain":"44.6connect.com","attr_6c":{"range":"S","restricted":[1,1002,1003,1004],"1002":null,"1003":null,"1004":null,"1005":null},"type":"domain","util":{"S":{"used":11,"total":1000}}}}</code>	ERROR	<code>{"success":0,"message":"error message" }</code>								
SUCCESSFUL	<code>{"success":1,"message":"Domain 2 updated","id":"2","data":{"id":"2","domain":"44.6connect.com","attr_6c":{"range":"S","restricted":[1,1002,1003,1004],"1002":null,"1003":null,"1004":null,"1005":null},"type":"domain","util":{"S":{"used":11,"total":1000}}}}</code>												
ERROR	<code>{"success":0,"message":"error message" }</code>												
Required Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>domain</td> <td>STRING</td> <td>6connect.com</td> <td>Name of VLAN Domain</td> </tr> <tr> <td>range</td> <td>STRING</td> <td>E</td> <td>VLAN range. E for Extended or S for Standard</td> </tr> </tbody> </table>	Name	Type	Example	Description	domain	STRING	6connect.com	Name of VLAN Domain	range	STRING	E	VLAN range. E for Extended or S for Standard
Name	Type	Example	Description										
domain	STRING	6connect.com	Name of VLAN Domain										
range	STRING	E	VLAN range. E for Extended or S for Standard										
Optional Parameters	None.												
Example URL	api/v1/api.php?target=vlan&action=updateDomain&domain=DefaultDomainnn&range=S&id=1												

update

URL	api/v1/api.php?target=vlan&action=update								
Description	Update properties of a VLAN: name, tags, or both.								
Returns	<p>Examples</p> <table border="1"> <tr> <td>SUCCESSFUL</td> <td><code>{"success":1,"message":"VLAN (table ID 11735) updated","id":"11735","data":{"id":"11735","vlan":"50","domain_id":"7","resource_id":null,"name":"","domain_name":"lax.com","tags":[],"tagsString":[]}}</code></td> </tr> <tr> <td>ERROR</td> <td><code>{"success":0,"message":"error message" }</code></td> </tr> </table>	SUCCESSFUL	<code>{"success":1,"message":"VLAN (table ID 11735) updated","id":"11735","data":{"id":"11735","vlan":"50","domain_id":"7","resource_id":null,"name":"","domain_name":"lax.com","tags":[],"tagsString":[]}}</code>	ERROR	<code>{"success":0,"message":"error message" }</code>				
SUCCESSFUL	<code>{"success":1,"message":"VLAN (table ID 11735) updated","id":"11735","data":{"id":"11735","vlan":"50","domain_id":"7","resource_id":null,"name":"","domain_name":"lax.com","tags":[],"tagsString":[]}}</code>								
ERROR	<code>{"success":0,"message":"error message" }</code>								
Required Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>id</td> <td>INTEGER</td> <td>11735</td> <td>VLAN record ID (which is "id" of the VLANs in "get" action results)</td> </tr> </tbody> </table>	Name	Type	Example	Description	id	INTEGER	11735	VLAN record ID (which is "id" of the VLANs in "get" action results)
Name	Type	Example	Description						
id	INTEGER	11735	VLAN record ID (which is "id" of the VLANs in "get" action results)						

Optional Parameters	Name	Type	Example	Description
	name	STRING or empty string	HQ	name of the VLAN
	tags	INTEGER or STRING or empty string	111,112	ID of tags to be assigned to this VLAN. Multiple tags IDs are assignable with comma delimiter. Empty parameter will result in no tags being assigned.
	enabled	BOOLEAN	false	Set the VLAN as enabled (true) or disabled (false).
Example URL	<pre>api/v1/api.php?target=vlan&action=update&id=11735&name=OReilly&tags=156,159 api/v1/api.php?target=vlan&action=update&id=11735&name=OReilly api/v1/api.php?target=vlan&action=update&id=11735&tags=156,159 api/v1/api.php?target=vlan&action=update&id=11735&name= api/v1/api.php?target=vlan&action=update&id=11735&tags=</pre>			

removeTags

URL	api/v1/api.php?target=vlan&action=removeTags																
Description	Remove tags from a domain's VLAN(s).																
Returns	<p>Examples</p> <table border="1"> <tr> <td>SUCCESSFUL</td> <td><code>{"success":1,"message":"VLAN tags for VLANs updated","id":"1","data":[]}</code></td> </tr> <tr> <td>ERROR</td> <td><code>{"success":0,"message":"error message"}</code></td> </tr> </table>				SUCCESSFUL	<code>{"success":1,"message":"VLAN tags for VLANs updated","id":"1","data":[]}</code>	ERROR	<code>{"success":0,"message":"error message"}</code>									
SUCCESSFUL	<code>{"success":1,"message":"VLAN tags for VLANs updated","id":"1","data":[]}</code>																
ERROR	<code>{"success":0,"message":"error message"}</code>																
Required Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>domainId</td> <td>INTEGER</td> <td>1</td> <td>domain ID for domain whose VLANs will be un-tagged</td> </tr> <tr> <td>vlan</td> <td>INTEGER or STRING</td> <td>500 500-510</td> <td>a single VLAN (not the record ID from the get action results, but actual VLAN ID), OR range of VLANs (using hyphen for minimum through maximum), OR comma-delimited list of VLANs and/or VLAN ranges</td> </tr> <tr> <td>tagId</td> <td>INTEGER or STRING</td> <td>150,99</td> <td>a single tag ID or comma-delimited list of tag ID's</td> </tr> </tbody> </table>	Name	Type	Example	Description	domainId	INTEGER	1	domain ID for domain whose VLANs will be un-tagged	vlan	INTEGER or STRING	500 500-510	a single VLAN (not the record ID from the get action results, but actual VLAN ID), OR range of VLANs (using hyphen for minimum through maximum), OR comma-delimited list of VLANs and/or VLAN ranges	tagId	INTEGER or STRING	150,99	a single tag ID or comma-delimited list of tag ID's
Name	Type	Example	Description														
domainId	INTEGER	1	domain ID for domain whose VLANs will be un-tagged														
vlan	INTEGER or STRING	500 500-510	a single VLAN (not the record ID from the get action results, but actual VLAN ID), OR range of VLANs (using hyphen for minimum through maximum), OR comma-delimited list of VLANs and/or VLAN ranges														
tagId	INTEGER or STRING	150,99	a single tag ID or comma-delimited list of tag ID's														
Optional Parameters	None																
Example URL	<pre>api/v1/api.php?target=vlan&action=removeTags&domainId=1&vlan=500-510&tagId=159 api/v1/api.php?target=vlan&action=removeTags&domainId=1&vlan=400,406,500-510&tagId=159,160</pre>																

addTags

URL	api/v1/api.php?target=vlan&action=addTags							
Description	Add tags to a domain's VLAN(s).							
Returns	<p>Examples</p> <table border="1"> <tr> <td>SUCCESSFUL</td> <td><code>{"success":1,"message":"VLAN tags for VLANs updated","id":"1","data":[]}</code></td> </tr> <tr> <td>ERROR</td> <td><code>{"success":0,"message":"error message"}</code></td> </tr> </table>				SUCCESSFUL	<code>{"success":1,"message":"VLAN tags for VLANs updated","id":"1","data":[]}</code>	ERROR	<code>{"success":0,"message":"error message"}</code>
SUCCESSFUL	<code>{"success":1,"message":"VLAN tags for VLANs updated","id":"1","data":[]}</code>							
ERROR	<code>{"success":0,"message":"error message"}</code>							

Required Parameters	Name	Type	Example	Description
	domainId	INTEGER	1	domain ID for domain whose VLANs will be un-tagged
	vlan	INTEGER or STRING	515 500-510	a single VLAN (not the record ID from the get action results, but actual VLAN ID), OR range of VLANs (using hyphen for minimum through maximum), OR comma-delimited list of VLANs and/or VLAN ranges
	tagId	INTEGER or STRING	150,99	a single tag ID or comma-delimited list of tag ID's
Optional Parameters	None			
Example URL	api/v1/api.php?target=vlan&action=addTags&domainId=1&vlan=500-510&tagId=159 api/v1/api.php?target=vlan&action=addTags&domainId=1&vlan=400,406,500-510&tagId=159,160			

smartAssign

URL	api.php?target=vlan&action=smartAssign															
Description	Finds and enables an unassigned VLAN matching the provided search parameters and optionally renames it.															
Returns	<p>Examples</p> <table border="1"> <tr> <td>SUCCESSFUL</td> <td colspan="3">Return Data: the full domain description, plus the chosen VLAN with its new name (optional)</td> </tr> <tr> <td></td> <td colspan="3"> <pre>{ "success":1, "message":"VLAN enabled. ", "data":{"21":{"id":"21", "domain":"Swisscom Demo", "attr_6c":{"range":"E"}, "attr_custom":null, "vlans":{"id":"46183", "vlan":"1808", "name":"RESERVED_DEV"}}}}</pre> </td> </tr> <tr> <td>ERROR</td> <td colspan="3"> <pre>{ "success":0, "message":"error message" }</pre> </td> </tr> </table>				SUCCESSFUL	Return Data: the full domain description, plus the chosen VLAN with its new name (optional)				<pre>{ "success":1, "message":"VLAN enabled. ", "data":{"21":{"id":"21", "domain":"Swisscom Demo", "attr_6c":{"range":"E"}, "attr_custom":null, "vlans":{"id":"46183", "vlan":"1808", "name":"RESERVED_DEV"}}}}</pre>			ERROR	<pre>{ "success":0, "message":"error message" }</pre>		
SUCCESSFUL	Return Data: the full domain description, plus the chosen VLAN with its new name (optional)															
	<pre>{ "success":1, "message":"VLAN enabled. ", "data":{"21":{"id":"21", "domain":"Swisscom Demo", "attr_6c":{"range":"E"}, "attr_custom":null, "vlans":{"id":"46183", "vlan":"1808", "name":"RESERVED_DEV"}}}}</pre>

IP Blocks - Update Fields

Context: How do I update the notes field of an IP block using the API in PHP?

✓ [Click here to expand...](#)

- 1) Start with providing instance information, API key, Secret Key, and DNS Server IP; set up the connection

```
<?php
//
// This file walks through an example of how to look up a block id number
// in ProVision, and then use it to attach a notes field
//
// supply the URL of your ProVision instance, your API key and your Secret key.
$proVisionURL = "https://ops.6connect.com/qa-4.2.2";
$apiKey = "32-5DAYTJEE2TZHOFOB";
$apiSecretKey = "48b278ec873bda473a323dbc467f8669";
// this example uses 6connect's PHP APIClient
require_once("APIClient.php");
// set up the connection
$apiClient = new APIClient($proVisionURL, $apiKey, $apiSecretKey);
```

- 2) Split the metadata you want to have showing in the notes, and find the block with which it should associate

```
// lets imagine we have some metadata in the following format:
//
$string = "10.1.245.5||DFW7|HP a5820x|its-erp.dfw7.us.corp||";
//
// And we want to insert the Colo, Server type, and hostname into the Notes field of
the IP block

// first we split everything up
$pieces = explode("|", $string);
$ip = $pieces[0];
$colo = $pieces[2];
$type = $pieces[3];
$host = $pieces[4];

// then we pull the IP block using the API.
$params = array();
$params['block'] = "$ip/32"; // the IP block we're looking for, with netmask
// make the call to the IPAM-GET endpoint
$response = $apiClient->sendRequest('ipam', 'get', $params);
if ($response->status != 1) {
    echo "Could not pull information for block: $ip/32 !\n";
    die();
}
if (trim($response->message) == "No blocks found.") {
    echo "IP block $ip/32 not found in ProVison!\n";
    die();
}

// we now have the ipObject associated with this IP block. Lets get its block id.
$blockId = $response->data[0]['id'];
echo "IP block id: $blockId \n";
```

3) Update the block with the notes

```
// it is time to update the block with the new notes.
$notes = "$colo,$type,$host";
$params = array();
$params['id'] = $blockId;
$params['notes'] = $notes;
// make the call to the IPAM-UPDATE endpoint
$response = $apiClient->sendRequest('ipam', 'update', $params);

// and done!
echo $response->message . "\n";
```

IP Blocks - Assign / Subassign

Context: I unassigned an IP address and now it's in the Holding Tank. Now I want to assign an IP from the Holding Tank. I don't want to unassign an IP randomly, in case it is allocated to a Resource. What are my options?

✓ [Click here to expand...](#)

There are 3 options:

- 1) If you know the specific IP, you can use use the ipam-get api call to determine if it is in Holding:

```
/api/v1/api.php?target=ipam&action=get&cidr=1.2.3.4/32

{
  id:1234,
  cidr:"1.2.3.4",
  ...
  resource_name:"Holding"
}
```

2) If you want to show all blocks/IPs in Holding, you can use the following ipam-get API call:

```
/api/v1/api.php?target=ipam&action=get&resourceQuery={"name":"Holding"}
```

3) If you know the block is in Holding, you can issue another ipam-unassign API call to move it from Holding to Available:

```
/api/v1/api.php?target=ipam&action=unassign&block=1.2.3.4/32
```

Context: I need to create a Resource Holder, assign them an IP block, then subassign some IPs out of that block to two new Resource Holders. What does this look like in Python?

▼ [Click here to expand...](#)

We broke this up in a few steps so it's easier to link together.

1) Let's create a Resource Holder called "Ned"

```
query_string =
'target=resource&action=add&meta[type]=entry&meta[section]=resource-holder&meta[name]=N
+= '&apiKey=' + api_key
hash          = base64.b64encode( hmac.new(api_secret_key, query_string,
hashlib.sha256).digest() )
url           = base_url + '?' + query_string + '&hash=' + hash
print 'Create Ned resource holder'
print url, "\n"
data = json.load(urllib2.urlopen(url))
ned_resource_id = data['data']['id']
```

2) Now let's add the 213.29.27.0/24 IP block

```
query_string = 'target=ipam&action=add&rir=RIPE&block=213.29.27.0/24'
query_string += '&apiKey=' + api_key
hash          = base64.b64encode( hmac.new(api_secret_key, query_string,
hashlib.sha256).digest() )
url           = base_url + '?' + query_string + '&hash=' + hash
print 'Create 213.29.27.0/24 block'
print url, "\n"
data = json.load(urllib2.urlopen(url))
```

3) With the block in the system, we can assign 213.29.27.0/24 to "Ned" the Resource Holder

```
query_string = "target=ipam&action=directAssign&block=213.29.27.0/24&resourceId=%d"
% (ned_resource_id)
query_string += '&apiKey=' + api_key
hash          = base64.b64encode( hmac.new(api_secret_key, query_string,
hashlib.sha256).digest() )
url           = base_url + '?' + query_string + '&hash=' + hash
print 'Assign 213.29.27.0/24 block to Ned'
print url, "\n"
data = json.load(urllib2.urlopen(url))
```

4) Since we plan on assigning IPs out of this block, we should enable subassignments for 213.29.27.0/24

```
query_string =
'target=ipam&action=update&block=213.29.27.0/24&allowSubAssignments=true'
query_string += '&apiKey=' + api_key
hash         = base64.b64encode( hmac.new(api_secret_key, query_string,
hashlib.sha256).digest() )
url          = base_url + '?' + query_string + '&hash=' + hash
print 'Update 213.29.27.0/24 to allow sub assignments'
print url, "\n"
data = json.load(urllib2.urlopen(url))
```

5) Now let's create a Resource Holder "Tara"

```
query_string =
"target=resource&action=add&meta[type]=entry&meta[section]=resource-holder&meta[name]=T
% (ned_resource_id)
query_string += '&apiKey=' + api_key
hash         = base64.b64encode( hmac.new(api_secret_key, query_string,
hashlib.sha256).digest() )
url          = base_url + '?' + query_string + '&hash=' + hash
print 'Create Tara resource holder'
print url, "\n"
data = json.load(urllib2.urlopen(url))
tara_resource_id = data['data']['id']
```

6) To keep it interesting, let's create another Resource Holder "Una"

```
query_string =
"target=resource&action=add&meta[type]=entry&meta[section]=resource-holder&meta[name]=U
% (ned_resource_id)
query_string += '&apiKey=' + api_key
hash         = base64.b64encode( hmac.new(api_secret_key, query_string,
hashlib.sha256).digest() )
url          = base_url + '?' + query_string + '&hash=' + hash
print 'Create Una resource holder'
print url, "\n"
data = json.load(urllib2.urlopen(url))
una_resource_id = data['data']['id']
```

7) Assign a /28 block from Ned's 213.29.27.0/24 to Tara

```
query_string =
"target=ipam&action=smartAssign&type=ipv4&rir=RIPE&mask=28&&resourceId=%d&assignedResou
% (tara_resource_id, ned_resource_id)
query_string += '&apiKey=' + api_key
hash         = base64.b64encode( hmac.new(api_secret_key, query_string,
hashlib.sha256).digest() )
url          = base_url + '?' + query_string + '&hash=' + hash
print 'Assign block from Ned\'s 213.29.27.0/24 to Tara'
print url, "\n"
data = json.load(urllib2.urlopen(url))
```

8) Then assign another /28 block from Ned's 213.29.27.0/24 to Una

```

query_string =
"target=ipam&action=smartAssign&type=ipv4&rir=RIPE&mask=28&&resourceId=%d&assignedResou
% (una_resource_id, ned_resource_id)
query_string += '&apiKey=' + api_key
hash = base64.b64encode( hmac.new(api_secret_key, query_string,
hashlib.sha256).digest() )
url = base_url + '?' + query_string + '&hash=' + hash
print 'Assign block from Ned\'s 213.29.27.0/24 to Una'
print url, "\n"
data = json.load(urllib2.urlopen(url))

```

DNS

Context: I need to set up a DNS server using ProVision's API in PHP, create a zone with a few simple records, and push it to the server.

✓ [Click here to expand...](#)

- 1) Start with providing instance information, API key, Secret Key, and DNS Server IP

```

<?php
//
//
// supply the URL of your ProVision instance, your API key and your Secret key.
$proVisionURL = "https://ops.6connect.com/qa-4.2.2";
$apiKey = "Nnvz8xKZDQUWke6gDxb";
$apiSecretKey = "2YojRbrHnToPZ7cDeFBzcTAvcfMbPVmX";
// this example uses 6connect's PHP APIClient
require_once("APIClient.php");
// set up the connection
$apiClient = new APIClient($proVisionURL, $apiKey, $apiSecretKey);

// save this. IP of the DNS Server we're creating.
$serverIp = "208.39.106.184";

```

- 2) Add a DNS server

```

// begin making api calls. We begin by adding a simple DNS server.
$params = array();
$params['displayName'] = "Example Server";           // the pretty name of the DNS server
$params['server'] = "208.39.106.184";              // the IP of the DNS Server
$params['active'] = 1;                             // whether or not this server is currently enabled
$params['transferType'] = "SCP";                    // we are using an
ISC Bind server which we will communicate with via SCP
$params['username'] = "6connect";                    // the username used to SCP zones to this
server
$params['password'] = "password";                    // the password used to SCP zones to this
server
$params['port'] = 22;                               // the port used
to SCP zones to this server
$params['serverType'] = "master";                    // whether this server is a master or a
slave
$params['SOA'] = "ns1.dns.6connect.net. hostmaster.6connect.net."; // the default SOA
$params['remoteDirectory'] = "/tmp/";                // where to place the zone files on the
server
$params['namedConfPath'] = "/tmp/";                 // the path to the zones within the
configuration file. Usually the same as 'remoteDirectory'
$params['postCommand'] = "touch /tmp/allFinished";  // the command to execute on
the server after the transfer is complete.
// add the server
$response = $apiClient->sendRequest('dnsServer', 'add', $params);
if ($response->status == 1) {
    echo "Successfully added DNS Server '" . $params['displayName'] . "'\n";
} else {
    echo "Could not add DNS Server '" . $params['displayName'] . "' !\n";
    die();
}

// now we fetch the id of our newly created server
$params = array();
$response = $apiClient->sendRequest('dnsServer', 'get', $params);
$data = $response->data;
for ($i = 0; $i < count($data); $i++) {
    if ($data[$i]['server'] == $serverIp) {
        // we save the id for later.
        $serverId = $data[$i]['id'];
        break;
    }
}
echo "Server Id is: $serverId \n";

```

3) Create a zone

```
// okay, DNS server is set up -- time to create a zone.
$params = array();
$params['zoneName'] = "atestzone.com";    // zone name
$params['zoneResourceId'] = 1;           // the owner of the zone; 1 is default
$response = $apiClient->sendRequest('zone', 'add', $params);
if ($response->status == 1) {
    echo "Successfully added DNS Zone '" . $params['zoneName'] . "'\n";
} else {
    echo "Could not add DNS Zone '" . $params['zoneName'] . "' !\n";
    die();
}
// snag the zoneId for later.
$zoneId = $response->data;
```

4) Add Zone records

```

// Lets add some records to our new zone!
$params = array();
$params['newRecordZoneId'] = $zoneId;           // parent zone id
$params['newRecordType'] = 'A';                // record type
$params['newRecordHost'] = "www";              // the host field of the record
$params['newRecordValue'] = "1.2.3.4";        // the value field of the
record
$params['newRecordTTL'] = "3600";              // the value of the TTL field
$response = $apiClient->sendRequest('record', 'add', $params);
if ($response->status == 1) {
    echo "Successfully added Record to zone #\$zoneId\n";
} else {
    echo "Could not add Record to zone #\$zoneId!\n";
    die();
}

$params = array();
$params['newRecordZoneId'] = $zoneId;           // parent zone id
$params['newRecordType'] = 'A';                // record type
$params['newRecordHost'] = "dev";              // the host field of the
record
$params['newRecordValue'] = "2.3.4.5";        // the value field of the record
$params['newRecordTTL'] = "3600";              // the value of the TTL field
$response = $apiClient->sendRequest('record', 'add', $params);
if ($response->status == 1) {
    echo "Successfully added Record to zone #\$zoneId\n";
} else {
    echo "Could not add Record to zone #\$zoneId!\n";
    die();
}

$params = array();
$params['newRecordZoneId'] = $zoneId;           // parent zone id
$params['newRecordType'] = 'A';                // record type
$params['newRecordHost'] = "cloud";            // the host field of the record
$params['newRecordValue'] = "3.4.5.6";        // the value field of the
record
$params['newRecordTTL'] = "3600";              // the value of the TTL field
$response = $apiClient->sendRequest('record', 'add', $params);
if ($response->status == 1) {
    echo "Successfully added Record to zone #\$zoneId\n";
} else {
    echo "Could not add Record to zone #\$zoneId!\n";
    die();
}

```

4) Link the Zone to the new DNS server and push

```

// Okay, we have some zones with records. Time to link this zone to the new DNS
Server
$params = array();
$params['serverId'] = $serverId;      // the server id
$params['zoneId'] = $zoneId;         // the zone id
$params['serverSlave'] = 0;          // not a slave zone
$apiResponse = $apiClient->sendRequest('zoneLinkage', 'add', $params);
if ($apiResponse->status == 1) {
    echo "Successfully linked Zone #\$zoneId to server #serverId\n";
} else {
    echo "Could not link Zone #\$zoneId to server #serverId!\n";
    die();
}
// now we can push the zone to the server
$params = array();
$params['zoneId'] = $zoneId;          // the zone id to push
$apiResponse = $apiClient->sendRequest('dnsServer', 'transferSingle', $params);
if ($apiResponse->status == 1) {
    echo "Zone pushed!\n";
} else {
    echo "Could not push zone!\n";
    die();
}
?>

```

DHCP

Context: I need to attach the DHCP module as a child

[Click here to expand...](#)

DHCPv2 functionality is enabled on a particular resource by attaching a DHCP Module as a child. A command to do this is as follows:

```

[ProVision root]/api/v1/api.php?target=resource&action=add

data:
meta[type]: dhcp_module
meta[name]: [parent resource id] DHCP Module
meta[parent_id]: [parent resource id]

```

The special resource type “dhcp_module” indicates to ProVision that the DHCP system is enabled for the parent object. The attributes associated with the “dhcp_module” resource govern the DHCP system’s behavior.

Updating the attributes of a DHCP Server uses a Resource Update command:

```

[ProVision root]/api/v1/api.php?target=resource&action=update&meta[id]=2178
&meta[type]=dhcp_module&fields[_dhcp_attributes][ ]={"type":"ISC","notes":"notes go
here","username":"username","port":"port","config_test":"/etc/init.d/dhcpd
configtest","server_stop":"/etc/init.d/dhcpd stop","server_start":"/etc/init.d/dhcpd
start","config_path":"/tmp/dhcpd.conf","option_routers":"192.168.0.0","option_domain_na
line 1","freeLine2":"free line 2","freeLine3":"free line 3"}

```

This command appears rather complicated, but can be broken apart into reasonable pieces. The first section:

```
target=resource&action=update&meta[id]=2178&meta[type]=dhcp_module
```

is familiar from other parts of ProVision. We are updating a resource of type "dhcp_module" whose resource id is 2178. The second section of the command details the update values, starting with

```
fields[_dhcp_attributes][]=
```

which contains a JSON-encoded string of all the fields specific to a DHCP server's function. When expanded into its full object form it is substantially easier to digest:

```
{
    "type": "ISC",
    "notes": "notes go here",
    "username": "username",
    "port": "port",
    "config_test": "/etc/init.d/dhcpd configtest",
    "server_stop": "/etc/init.d/dhcpd stop",
    "server_start": "/etc/init.d/dhcpd start",
    "config_path": "/tmp/dhcpd.conf",
    "option_routers": "192.168.0.0",
    "option_domain_name_servers": "ns1.6connect.com",
    "option_domain_name": "6connect.com",
    "authoritative": "1",
    "default_lease_time": "600",
    "max_lease_time": "7200",
    "local_port": "67",
    "log_facility": "local7",
    "password": "password",
    "server_ip": "192.168.0.1",
    "freeLines": 3,
    "freeLine1": "free line 1",
    "freeLine2": "free line 2",
    "freeLine3": "free line 3"
}
```

This object describes all the most common DHCP server configuration options. For a full explanation of each of the fields, see the Detailed API Specification later in this document.

Please note that the object above must be passed to the DHCP system as a JSON-encoded string. It must be passed into the special "_dhcp_attributes" attribute for it to be functional, as in the example URL.

Context: I need to add a DHCP aggregate

✓ [Click here to expand...](#)

An example command to add a DHCP Aggregate is:

```
[ProVision root]/api/v1/api.php?target=ipam&action=add&block=192.168.0.0/24&rir=1918&vlan=&tags=&region=&resourceId=1282&allowSubAssignments=true
```

The important part to note is that the IP block is being assigned to resourceid 1282, which corresponds to the DHCP Available resource. The DHCP Available resource is a system-level resource which is used to hold all unassigned DHCP IP addresses. Every instance has its own DHCP Available resource, whose id can be found with the following command:

```
[ProVision root]/api/v1/api.php?target=resource&action=get&slug=dhcp-available
```

New DHCP subnets and hosts draw their IPs from this pool. If there are no IPs in the DHCP Available pool new subnets and hosts will not be able to be created.

DHCP IP aggregates are fetched, updated, split, and deleted using the standard IPAM management API endpoints. Please see the [IPAM API Documentation](#) for details.

Context: I need to add a DHCP Pool

✓ [Click here to expand...](#)

Similar to how the “dhcp_module” resource was created above, the command to create a DHCP Pool is as follows:

```
[ProVision root]/api/v1/api.php?target=resource&action=add&meta[type]=dhcp_pool
&meta[name]=New
Subnet&fields[_dhcp_type][]=subnet&fields[_dhcp_pool_attributes][]={"mac":"","rangeStar
Line 1","freeLine2":"Free Line 2","freeLine3":"Free Line 3"}
```

The first half of this command is relatively straightforward:

```
target=resource&action=add&meta[type]=dhcp_pool&meta[name]=New Subnet
```

This section informs the API that we wish to create a new, empty “dhcp_pool” resource whose name is “New Subnet.”

```
fields[_dhcp_type][]=subnet&fields[_dhcp_pool_attributes][]={"mac":"","rangeStart":"","
"rangeEnd":"","freeLines":3,"freeLine1":"Free Line 1","freeLine2":"Free Line
2","freeLine3":"Free Line 3"}
```

The second half of the command behaves in a similar manner to the “dhcp_module.” The “_dhcp_pool_attributes” field holds a JSON-encoded string which describes the dhcp_pool resource. When expanded, the JSON string becomes the following object:

```
{
  "mac": "",
  "rangeStart": "",
  "rangeEnd": "",
  "freeLines": 3,
  "freeLine1": "Free Line 1",
  "freeLine2": "Free Line 2",
  "freeLine3": "Free Line 3"
}
```

For a full explanation of each of the fields, see the [Detailed API Specification](#).

Please note that the object above must be passed to the DHCP system as a JSON-encoded string. It must be passed into the “_dhcp_pool_attributes” attribute for it to be functional, as in the example URL.

Once a `dhcp_pool` resource is in the system it can be updated with IP data obtained from the IP Management system. Under DHCPv2, the DHCP system uses all the standard IPAM API endpoints and can make use of both the `smartAssign` and the `directAssign` methods. Please see the [IPAM API documentation](#) for details.

Context: I need to link a DHCP pool to a DHCP server

▼ [Click here to expand...](#)

An example of building a link between a `dhcp_pool` and a DHCP Server is:

```
[ProVision root]/api/v1/api.php?target=resource&action=addLink&resource_id1=2178&resource_id2=1452&relation=dhcpPoolLink
```

The Resource Linkage system controls which DHCP Pools are associated with a given DHCP Server. In the case of linking a DHCP Pool to a DHCP Server, the relation used is "dhcpPoolLink". This is a directional link, so it is important that `resource_id1` and `resource_id2` do not get confused.

```
relation: "dhcpPoolLink"
resource_id1: the id of the dhcp_module this pool is being linked to
resource_id2: the id of the dhcp_pool being linked
```

It is very important that `resource_id1` not be confused with `resource_id2`. The link will not function with the values reversed.

To undo the above and break a DHCP Pool link, use the same command but substitute "deleteLink" for the action "addLink".

```
[ProVision root]/api/v1/api.php?target=resource&action=deleteLink&resource_id1=2178&resource_id2=2179&relation=dhcpPoolLink
```

Context: I need to push a DHCP config file

▼ [Click here to expand...](#)

Once the server has been configured according to the previous sections, hitting the following API endpoint will trigger a DHCP push:

```
[ProVision root]/api/v1/api.php?target=dhcp&action=push&id=2178
```

The "id" in the above string is the id of the `dhcp_module` resource attached to the server you whose configuration is to be pushed. The API return payload will contain success or failure codes, as well as a description of any errors which might have occurred.

When a DHCP configuration file is pushed an SSH connection is opened to the configured server using the user, password, and port supplied to the `'_dhcp_attributes'` attribute on the `dhcp_module` resource. If the system successfully connects, it will assemble a DHCP configuration from the information given to the `dhcp_module`'s `'_dhcp_attribute'` attribute and then parse and add in all linked `dhcp_pool` resources.

After the assembled file has been transferred to the DHCP server it will be placed in the location given by `'config_path'` on the `dhcp_module`, and then the command described in `'config_test'` will be run to determine whether or not this new file parses correctly. If `'config_test'` is blank or omitted, this step is skipped.

If the file parses correctly the DHCP will be stopped and restarted according to the `'server_stop'` and `'server_start'` commands on the DHCP module. If there are errors at any point the system backs out, replaces old config files, and reports the errors via the `'message'` return field of the API call.

Python SDK:

IP Blocks

Context: How do I create aggregates, get block information, and delete aggregates using the API / python SDK?

✓ [Click here to expand...](#)

```
#!/usr/bin/python
from apiclient import APIClient, APIResponse

# REPLACE WITH CORRECT VALUES FOR YOUR INSTANCE

base_url = 'https://<ProVision Instance URL>'
api_key = '00-ABCDEFGHJIJ123456'
api_secret_key = '0123456789abcdef0123456789abcdef'

# create the APIClient
client = APIClient(base_url, api_key, api_secret_key)

# create aggregate 1.2.3.0/24
target = 'ipam'
action = 'add'
params = {'block': '1.2.3.0/24', 'rir': 'ARIN'}
url = client.get_request_url(target, action, params)
print url
response = client.make_api_call(target, action, params)
print response

# get block 1.2.3.0/24
target = 'ipam'
action = 'get'
params = {'block': '1.2.3.0/24'}
url = client.get_request_url(target, action, params)
print url
response = client.make_api_call(target, action, params)
print response
```

```
# delete aggregate 1.2.3.0/24

target = 'ipam'

action = 'delete'

params = {'block': '1.2.3.0/24'}

url = client.get_request_url(target, action, params)

print url
```

```
response = client.make_api_call(target, action, params)
print response
```

Reverse API

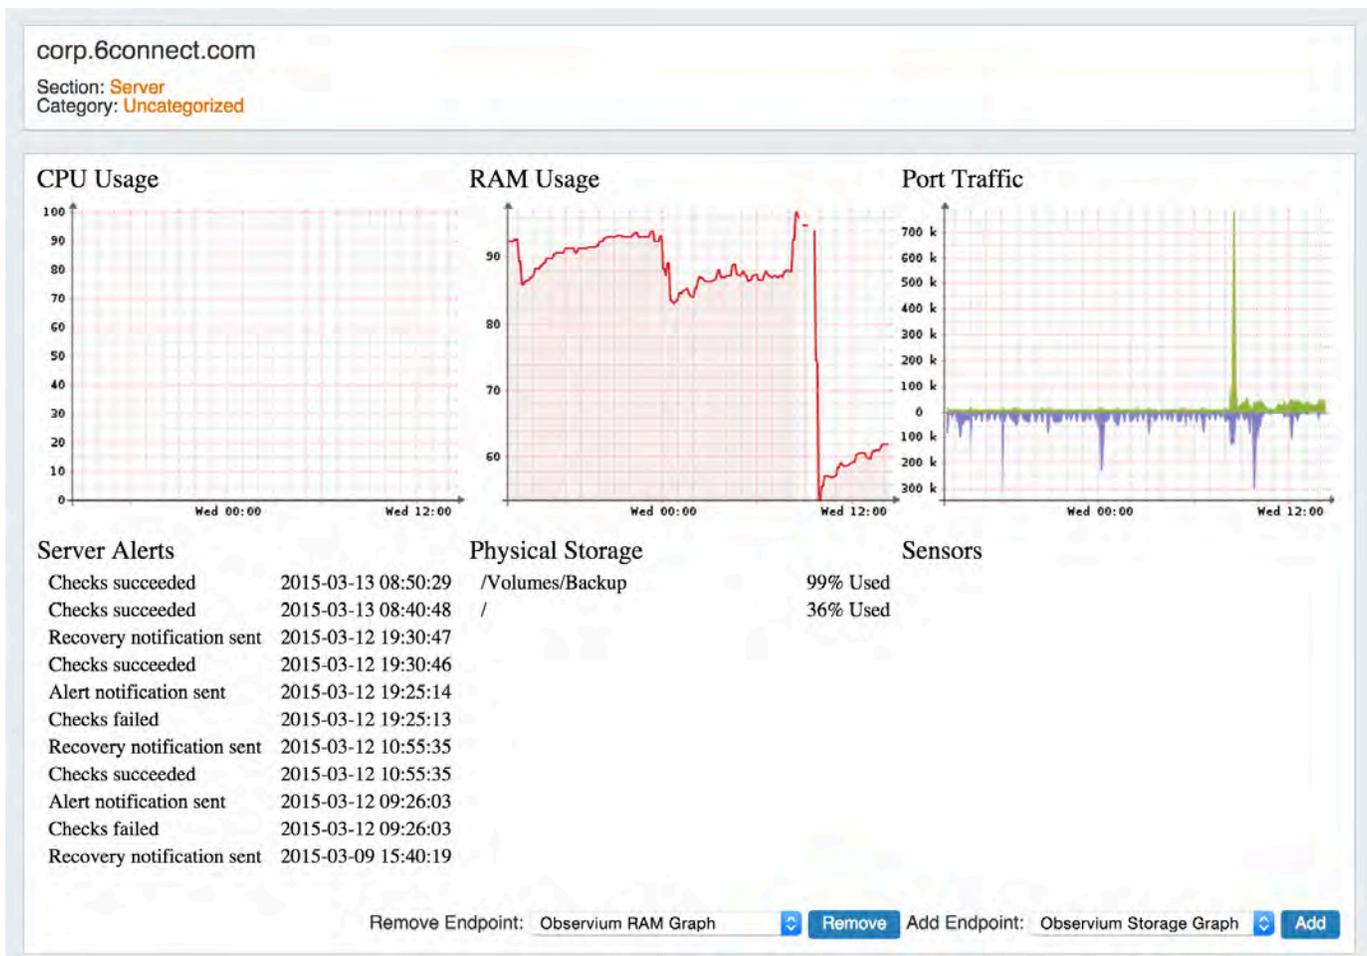

Reverse API

 - Reverse API Detail:

Overview

Reverse API Tools - Beta

ProVision's Reverse API calls and UI elements allow for integration with outside APIs to improve workflow and create custom display content. In the ProVision user interface, the [Reverse API](#) page allows for endpoints to be built and provides a text editor to create presentation JavaScript commands. This JavaScript presentation code is then displayed in the [Reverse API Gadget](#).

Using the ProVision Reverse API (rAPI), you can perform these same actions and customize to meet your specific needs outside of the ProVision UI.

API Call Formatting

Reverse API (rAPI) calls are made to hit a user-defined URL or command line program. If the rAPI type is set to 'external,' the system makes a HTTP request. If the rAPI type is set to 'local,' it executes the call on the command line of the local machine. In both cases the call is first customized with the attributes of the resource supplied to the execute function. This allows a single rAPI endpoint to serve a wide array of individual resources, fetching only information relevant to that particular resource without having to store anything locally.

rAPI calls are formatted thusly:

```
http://observium.tcp0.com/graph.php?height=200&width=265&type=device_bits&legend=no&userna
```

The interesting part about this URL is the bit in curly-braces: {observium-id}. When this call is made, the system decodes the URL by searching for everything within curly-braces and replaces it with data pulled from a resource. A rAPI call may have as many or as a few curly-brace replacement targets as is needed. Each curly-brace target will be replaced with exactly one resource attribute. All targets must be successfully replace for the command to succeed.

For example, when this rAPI call is decoded with information from the 1-dev resource, the decoded call is as follows:

```
http://observium.tcp0.com/graph.php?height=200&width=265&type=device_bits&legend=no&userna
```

The rAPI service then pulls the data from that URL, pairs it with its presentation code, and returns it via the execute endpoint. If a user attempted to execute the above call on a resource which did not have the "observium-id" property, the execute endpoint would return the following error: "Reverse API Call references token 'observium-id', which does not exist in resource."

All curly-brace calls reference a resource attribute by their unique resource slugs. The list of available resource attributes can be customized using the existing resource system endpoints.

Curly-brace targets may take the form {parent.observium-id}. The "parent." prefix indicates that in decoding this particular brace, the attributes of the resource's parent are to be used.

Reverse API Detail:

For detail on the Reverse API calls and parameters, proceed to [Reverse API - Detail](#).

CLI (Alpha)

Command Line Interface - ALPHA

- Command Line Interface - ALPHA
 - Overview
 - CLI Commands (ALPHA)

Overview

The command line interface for ProVision is a beta feature that has been release for feedback.

How to Access the CLI from your browser

When logged into ProVision via a web browser, use the key combination "**Control+Shift+S**" or "**Control+Shift+~**" to access/close the CLI

CLI Commands (ALPHA)

CLI Help

When in the CLI, type:

```
ipam man
```

for sample commands and syntax

Currently, the CLI supports the following commands:

```
ipam <command> [-t] [<cidr>] [<resource name>] [<args>]
```

show: show details for a block. Examples:

- "ipam show 10.0.0.0/8" will show details for the block 10.0.0.0/8

- "ipam show holding" will show details for all blocks in the Holding

Tank

- "ipam show "<resource name>" will show details for all blocks assigned to <resource name>

add: add a block. ex: "ipam add 192.168.0.0/24"

update: update attributes for a block. ex: ipam update 192.168.0.0/24 --vlan=100 tags=VM,Dev

assign: assign a block to a resource. ex: ipam assign 192.168.0.0/24 "<resource name>"

assign: smart assign a block to a resource. ex: ipam assign --mask=24 --rir=ARIN --type=ipv4 "<resource name>"

unassign: reclaims a block from a resource and places it in the Holding Tank. If the block is already in the holding tank, reclaims it and makes it available.

Toolkit

Toolkit Modules

6connect provides customers with additional CLI modules for ProVision power users in the /tools directory. These tools are outlined below.

- Toolkit Modules
 - Users / Permissions
 - Add User
 - Rebuild Permissions
 - DNS
 - Audit Forward DNS
 - Audit Reverse DNS
 - Database
 - Database Analyzer
 - Database Reset
 - Import
 - IPPlan Importer:
 - Internal 6connect Tools
 - Additional Information:

Users / Permissions

Add User

File: add-user.php

Description: Adds a new user to 6connect Provision. Especially useful if an admin has locked themselves out and has access to the local server, or for adding additional credentials to a new local installation. The tool walks through the required information.

Command: "php add-user.php"

Rebuild Permissions

File: rebuild-permissions.php

Description: Will rebuild the cached permissions for the specified resource id. Should not be used outside of a db reset, or a corruption of the permissions cache.

Command: "php rebuild-permissions.php"

DNS

Audit Forward DNS

File: audit_forward_dns.php

Description: Audits the forward DNS for a specified IP block, comparing the DNS records in 6connect to a publicly facing server. Will provide detail output showing resolved records, if records conflict and why.

Command: "php audit_forward_dns.php"

Options:

-v Sets verbose mode to print debug information

-a <message key> run as asynchronous request (note: you should not use this, it is for the GUI)

-b <ip block> IP block in cird notation to audit dns for.

-n <name server> FQDN or IP address of specific name server to resolve records against. Defaults to 8.8.8.8.

-h print help

Audit Reverse DNS

File: audit_reverse_dns.php

Description: Audits the reverse DNS for a specified IP block, comparing the DNS records in 6connect to a publicly facing server. Will provide detail output showing resolved records, if records conflict and why.

Command: "php audit_reverse_dns.php"

Options:

- v Sets verbose mode to print debug information
- a <message key> run as asynchronous request (note: you should not use this, it is for the GUI)
- b <ip block> IP block in cird notation to audit dns for.
- n <name server> FQDN or IP address of specific name server to resolve records against. Defaults to 8.8.8.8.
- h print help

Database

Database Analyzer

File: databaseAnalyzer.php

Description: Takes two MySQL dump files for input, one thought to be the "good" database, and one the "bad" to compare against each other for differences. Is used internally to audit database changes after an upgrade to ensure all changes for the upgrade were committed by comparing against the template database for that release. Can be useful for diagnosing missed upgrades, or other database issues. Could be used on any set of databases, and is not 6connect specific.

Command: "php databaseAnalyzer.php"

Options:

- v Sets verbose mode to print debug information
- a <database name> Required - the 'good' database to comapre against.
- b <database name> Required - the 'bad' database to check for incorrect information.
- g <globals file> Optional - The script will automatically look to the globals.php file for database connection information. This option can be used to specify and alternate file, or file location.
- h print help

Database Reset

File: dbReset.php

Description: This tool resets portions or all of the database to factory defaults. Can reset only IP, DNS, or Resource information or all all three. If erasing resource information, you need to enter a user to assume global admin permission to log back in with. Even if this isn't specified, the add-user tool can be used to add a user back after. We recommend creating a backup prior to using this tool, and only use if you are sure you know what you are doing!

Command:"php dbReset.php"

Options:

- v Sets verbose mode to print debug information
- i Erases any and all IP information. Tags, regions, and other IPAM preference settings are not changed.
- d Erases any and all DNS information including zones, records, and archive data. Does not affect DNS perference settings, or configured DNS servers.
- r Resets all resource information back to the factory defaults, and removes all associated information (user groups, files, etc).
- u <user name> User name that will have Global Admin permissions restored on the default resources

Import

IPPlan Importer:

File: ipplan_import.php

Description: The IPPlan Importer is a command-line tool to import IPs from an IPPlan database into ProVision. Details on how to use this tool are available at [IPPlan Importer](#).

Command: "php ipplan_import.php"

Options:

For options, refer to [IPPlan Importer](#).

Internal 6connect Tools

The following tools contained in the /tools folder are for 6connect internal use only:

File: scp_wrapper.php - Internal 6connect tool, not meant for command line use.

File: s64_restart_master - Internal 6connect tool, not meant for command line use.

File: s64_restart_slave - Internal 6connect tool, not meant for command line use.

File: async_import.php - Internal 6connect tool, not meant for command line use.

File: importBigDump.php - Internal 6connect tool supporting IPPlan Importer, not meant for command line use.

File: ipplan_functions.php - Internal 6connect tool supporting IPPlan Importer, not meant for command line use.

File: dns_transfer_server.php - Internal 6connect tool, not meant for command line use.

File: observium_import.php - Internal 6connect tool, not meant for command line use.

File: digAndLookup.php

File: pullLAMPInfo.php

IPPlan Importer

IPPlan Importer

- IPPlan Importer
 - Overview
 - Before you begin:
 - Connector Method (Results in .csv files only):
 - Importer Method (Results in full import):
 - Run & Set the RIR:
 - Additional Run Options:
 - Load SQL Without Importing
 - Generate CSV Without Loading SQL
 - Generate CSV No Overwrite
 - Generate CSV With RIR
 - Run Only Import
 - Run Import No Overwrite

Overview

The IPPlan Importer is a command-line tool to import IPs from an IPPlan database into ProVision. This tool can be used via two approaches: generating .csv files via the tool only, then using the ProVision IP Import UI to import the csv files (Connector), or as a full command-line import solution, bypassing the ProVision UI entirely (Importer).

Options:

- 1) Generate .csv files to use with the IP Import - Upload/Import from CSV tool through the ProVision UI.
- 2) Import IPs directly into ProVision without accessing the UI.

Before you begin:

You will need:

- A MySQL export of IPPlan created from mysqldump, located on the same server / accessible from the IPPlan Importer tool.
- [Administrative](#) access to your ProVision instance folder

Accessing the Tool and Showing Help Instructions:

The tool is located in tools/ipplan_import.php. A help document is provided listing example commands and detailed situation-specific options.

To execute it, you must preface it with "php" program. From from your instance's root folder, the command would be:

```
"php tools/ipplan_import.php --help"
```

If you are in the tools folder, the command would be:

```
"php ipplan_import.php --help"
```

This will bring up the help / instruction document. It is also provided below.

✓ [Click here to see the IPPlan Importer help text...](#)

Help File Text

usage: php ipplan_import.php [options] <SQL dump file>

Examples:

For creating CSV's for use in ProVision IP importer:

```
php ipplan_import.php filename.SQL --csv
```

For creating CSV's, but do not load SQL file if one already has been:

```
php ipplan_import.php filename.SQL --csv --no-overwrite
```

For importing data from SQL dump. Note that you must specify RIR:

```
php ipplan_import.php filename.SQL --rir=1918
```

For importing data from SQL dump, if one hasn't been loaded already:

```
php ipplan_import.php filename.SQL --rir=1918 --no-overwrite
```

Caution: By default, SQL dump will be loaded into database 'provision_import_ipplan'. If database already exists it will be dropped, unless --no-overwrite option is specified.

options:

--only-import - Skip loading SQL file. Instead, import existing data in database 'provision_import_ipplan'.

--only-sql - Load SQL dump into database 'provision_import_ipplan'. --only-import can be run at a later time to use loaded database.

--rir=RIR - (required for import) RIR for IP's

OPTIONS IF LOADING SQL FILE:

--no-overwrite - Load SQL dump only if database 'provision_import_ipplan' is currently non-existent. Otherwise, drop existing database.

OPTIONS IF IMPORTING DATA:

--csv - generate CSV's instead of importing directly to ProVision.

Connector Method (Results in .csv files only):

This method creates .csv files that you can use with the IP Import - Upload/Import from CSV tool through the ProVision UI.

1. From the tools/ folder, run the tool with the --csv option. Be sure to reference your sql export file name and location:

```
"php ipplan_import.php ../ipplanv6.sql --csv"
```

(where '../ipplanv6.sql' is the path to your SQL file)

This will generate two files: ipplan_aggregates.csv and ipplan_hosts.csv. Both can be used to import in the IP import section of ProVision.

2. Copy / Download the generated .csv files to a browsable directory on your local machine, to be accessed by the ProVision UI.
3. Through the ProVision UI, import the ipplan_aggregates.csv file as described in [IP Import - Upload/Import from CSV](#).
4. Through the ProVision UI, import the ipplan_hosts.csv file as described in [IP Import - Upload/Import from CSV](#).

Note that you must import ipplan_aggregates first. into [IP Import - Upload/Import from CSV](#) to create the aggregates ipplan_hosts.csv

will use.

Then, import ipplan_hosts.csv as described in [IP Import - Upload/Import from CSV](#).

Importer Method (Results in full import):

This method has the tool process the import task. Using this case, you must set the RIR in the command line for all of the IP's.

Run & Set the RIR:

1. From the tools/ folder, run the tool with the --rir option, referencing your SQL file location:

```
"php ipplan_import.php ../ipplanv6.sql --rir=1918"  
(where '../ipplanv6.sql' is the path to your SQL file)
```

This will load your IPPlan database file into your mysql server and then import the hosts into ProVision. They will each be given the RIR you specified, as well as this text in the Notes field: 'IPPlan import'

The import may need to run for a number of minutes, depending on the size of your data. For reference, an import of 2100 hosts inside of 150 aggregates took approximately 10 minutes to complete during our testing.

Additional Run Options:

Additional run options for various combination of conditions are detailed below. The command is the text within the quotes only.

Load SQL Without Importing

You can load the SQL file, but NOT run an import, with the --only-sql option (feel free to include --no-overwrite option as well in case you don't want to overwrite a prior loaded SQL file):

```
"ipplan_import.php ../ipplanv6.sql --only-sql"  
"ipplan_import.php ../ipplanv6.sql --only-sql --no-overwrite"
```

Generate CSV Without Loading SQL

If you have already loaded the sql file previously, you can generate CSV files without having to load the SQL file:

```
"ipplan_import.php --only-import --csv"
```

Generate CSV No Overwrite

If you want to just generate CSV files without re-loading the database file, you can as well:

```
"ipplan_import.php ../ipplanv6.sql --no-overwrite --csv"
```

Generate CSV With RIR

You can also generate csv files with the rir option:

```
"ipplan_import.php ../ipplanv6.sql --no-overwrite --csv --rir=1918"
```

Run Only Import

If you have already loaded your IPPlan database with the tool before, you can do --only-import:

```
"php ipplan_import.php --rir=1918 --only-import"
```

Run Import No Overwrite

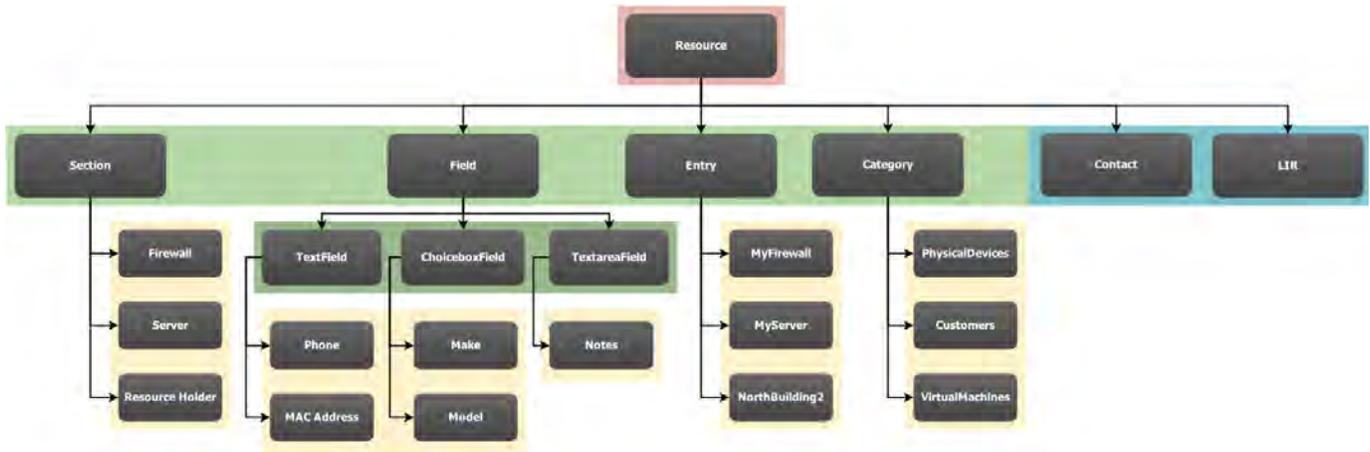

If you are not sure whether you have already loaded your IPPlan database with the tool before, you can specify --no-overwrite to NOT load the sql file if it was loaded already, or do load if it wasn't:

```
"ipplan_import.php ../ipplanv6.sql --rir=1918 --no-overwrite"
```

Resource Concepts 1

Overview

In Provision, the Resource System (RS) is an expression of object-oriented programming. In this context, the term “resource” is equivalent to the term “object”, where an object is an instance of a class. Traditionally in OOP, there is an Object class that is the root of the class hierarchy. In the RS, the Resource class is the root class. Every class in the system has Resource as a superclass and all resource objects implement the methods of that class.

The diagram above shows examples of resource sub-types. The items on a green or blue background are types of resources; they each have their own corresponding Class. An item on a yellow background is an example of an object that could have been instantiated from the class (resource type) that it's part of.

Additional Information:

- [Resource Classes Doc](#)
- [Database Layout 1](#)
- [Asset System](#)

Resource Classes Doc

Classes

"A class--the basic building block of an object-oriented language such as Java--is a template that describes the data and behavior associated with instances of that class. When you instantiate a class you create an object that looks and feels like other instances of the same class."

Mary Campione and Kathy Walrath, The Java Tutorial: Object-Oriented Programming for the Internet, The Java Series (Reading, Mass.: Addison Wesley, 1996)

- [Classes](#)
 - [Class Resource](#)
 - [Properties](#)
 - [Examples](#)
 - [1 - PHP](#)
 - [2 - API request](#)

Class Resource

```
class Resource {
    public int    $id;
    public string $name;
    public string $slug;
    public string $type;
    public int    $parent_id;
    public int    $category_id;

    protected array $attr    = array();
    protected bool  $loaded = FALSE;

    public object get_attr( string $key );
    public void   set_attr( string $key, object $value );
    public bool   loaded();
}
```

Properties

As you can see from the database layout, the public properties of the Resource class are all part of the main **resource** table. The two protected properties **attr** and **loaded** are created at runtime. There are many situations where only the core information is required. To improve performance, attribute data is ignored when it is not required. Attributes are stored in the database as longtext; non-primitive types (such as arrays) are serialized and stored as a string.

`$attr`

A key-value store of the attributes that exist in the `resource_attr` table.

`$loaded`

A boolean value which is used to indicate whether or not the attributes have been loaded.

Why do some attributes have names that start with an underscore?

This is the convention for storing metadata. Most attributes are for storing data that is created by the user and is available to be directly edited by the user. When we want to store system data, configuration options, or just data that isn't meant for human consumption - we store it as metadata. An attribute is identified as being metadata by the convention of starting the name/key of the attribute with an underscore character (e.g. `_meta`). If you are interfacing with the API, you will frequently come across metadata. You're welcome to modify the metadata of a resource (if you know what you're doing) or add metadata attributes for known metadata keys, but you shouldn't create your own attributes with keys that begin with an underscore. Future versions of ProVision will use new metadata keys without warning, and if there is a naming conflict, your data could be lost.

Examples

These examples show the different methods that can be used to find and load a Resource object. They also show different data structures that are used to represent the object.

1 - PHP

Internal code example

To help users better understand how ProVision works, some of the examples in this documentation are of internal processes. They can contain code that only works when used as part of the core system and thus is not applicable to 3rd party development. The API is currently the only way for external tools to integrate with ProVision. Any example that contains internal code should be clearly labeled. Some common characteristics of these examples are code that doesn't use the API and code written in PHP (most example code will be in JavaScript).

This example uses the ResourceQuery class to find a resource object and then prints the result. It is included to show the similarity between finding a resource via the API and what happens under the hood.

```
$params = array(
    'slug' => 'tlr'
);
$resourceQuery = new ResourceQuery();
$resource = $resourceQuery->query($params);

var_dump($resource);
/*
array (size=1)
  0 =>
    object(Resource)[27]
      protected 'id' => string '1' (length=1)
      protected 'name' => string 'TLR' (length=3)
      protected 'slug' => string 'tlr' (length=3)
      protected 'type' => string 'resource' (length=8)
      protected 'parent_id' => null
      protected 'category_id' => null
      protected 'attr' =>
        array (size=0)
          empty
      protected 'loaded' => boolean true
*/
```

2 - API request

This is a standard API request, the request data is urlencoded and the result is JSON

/api/v1/api.php?target=resource&action=get&slug=TLR

```
{
  "success": 1,
  "message": "Search successful",
  "data": [
    {
      "id": "1",
      "name": "TLR",
      "slug": "tlr",
      "type": "resource",
      "parent_id": null,
      "category_id": null,
      "attr": {}
    }
  ]
}
```

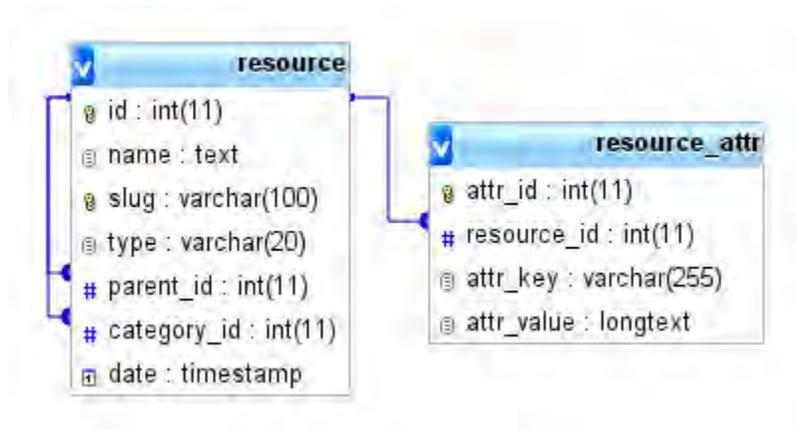

Database Layout 1

Database Layout

Details of the database and tables used by the RS are not necessary and should have no bearing on usage or API based development. However, a visualization of these tables may help some users better understand how the RS works, so they are provided below.

Asset System

The Asset System

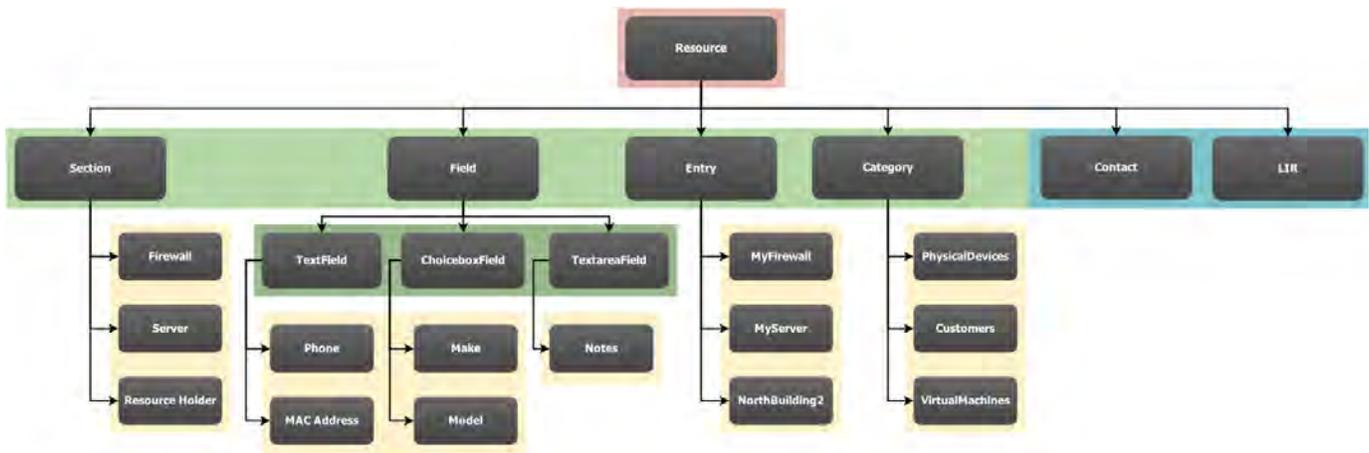

- The Asset System
 - Prerequisites
 - Overview
 - Introduction
 - Components
 - Section
 - Entry
 - Field
 - Category
 - Gadgets

Prerequisites

Some knowledge of object oriented programming (OOP) is recommended to understand the following description of the Asset System. If you are unfamiliar with OOP concepts, I would recommend reading a tutorial such as this one (<http://docs.oracle.com/javase/tutorial/java/concepts/index.html>) provided by Oracle or this one ([http://msdn.microsoft.com/en-us/library/ca22fyhc\(v=vs.90\).aspx](http://msdn.microsoft.com/en-us/library/ca22fyhc(v=vs.90).aspx)) provided by Microsoft, to help you understand terms like class, object, instantiate, property, method, and others.

Overview

The asset system is a content management system (CMS) that is built as an extension to the resource system. It's the main use of the resource system, and to many, the terms "asset system" and "resource system" can seem synonymous. In the diagram below, the Resource class is at the top in red. The child-classes that make up the asset system are in green. Yellow is used for examples of objects (not classes) that could/would have been instantiated from their Class. And the items in blue are examples of resource child-classes (resource types) that exist outside of the asset system.

Introduction

When writing software, the developer creates classes. A class is like a blueprint for objects. The class defines the properties and methods that the future objects will have, and like blueprints, multiple objects can be created from a single class. The Resource Class is a class, and each resource "type" (e.g. Section, Field, Contact, ect.) has a class, something which has been written in core code and cannot be changed by the user. The purpose of the asset system is to reproduce this fundamental low-level class-object system in such a way that the user can create their own classes, properties, methods, and objects without needing to dive into the code.

Components

Section

Sections are like classes, they are the templates/blueprints of the asset system. To create the structure of the blueprint, the user assigns fields (i.e. properties) and sometimes gadgets (i.e. methods) to the section.

Entry

Entries are the objects of the asset system. An entry cannot be created without a section to use as its blueprint. Creating an entry from a section is like instantiating an object from a class.

Field

Fields are the properties of the class. Field has its own child-classes; this is to accommodate the different types of fields. For example, when creating a class *Car*, the developer might give the *Car* class the property *String color*. In a similar fashion, a user of the Asset System could create a Section called *Truck*, a TextField called *color*, and then assign that textfield to the section. When the user goes to create an entry from the section *Truck*, they'll be given the option to include a text value for the field *color*.

Fields also have a use beyond acting as properties for classes. The field object (in this case *color*) is a resource object in it's own right. This means it can be modified independently of the sections that have assigned it and the entries that are using it. For example, a field which shows a dropdown box of several options could be modified to include more options; any entry which is using that field would automatically receive those new changes. Or consider a simple textfield object called "MAC Address" that is used by several sections and entries. If that field was modified to include a filter that checks the input for a valid MAC string, any entry using that field would get those improved validation checks.

Also, because the same field object can be assigned to multiple sections, it's easier to find entries by their values because they're all using the exact same field object. The alternative would have to be a blind text search to try and find different objects but with contextually similar values, and that method is notoriously unreliable. **This is why it's encouraged to assign the same field object to different sections as opposed to just making new fields each time.**

Fields are like what you might call class properties or class variables, but they've also got a lot more functionality available for when you need it.

Category

Categories are just an organizational tool. There is a clearly defined relationship between Sections, Entries, and Fields, but Categories exist on their own. If you look on the [Classes page](#), you'll see that every Resource has the same 6 fundamental properties and 3 of them are ID values. The first is the ID that belongs to the resource itself, the second is the ID of the resource's parent, and the third is the ID of the Category that the resource belongs to (if any). There isn't a strict hierarchy here, how you use categories is entirely up to you. You can create categories, child categories, and carefully plan exactly how you want the resources in your system to be organized. Or you can ignore the whole thing completely and just let every resource have the default category of "uncategorized." Many users find that the ability to create hierarchical parent-child relationships with entries, and then filter down results even further by Section, leaves the use of Categories unnecessary. But if you want to use them, it's there.

Gadgets

Gadgets are not resources, which is why they're not included in the chart at the top of the page. Gadgets are self contained applications and are limited to only using HTML, CSS, and JavaScript. All they know about the page that they're loaded on is the ID of the resource. However, because gadgets can interact with the API via JavaScript/AJAX, they're the perfect way to add new features to the asset system in a maintainable and modular way. At its core, the asset system just allows users to create entries and then modify their text based attributes through a simple form. The ability for gadgets (such as the IPAM-Gadget) to interact with the API, is what makes the asset system so powerful.

Currently, the only gadgets that can be assigned to sections are gadgets that have been created by 6Connect. However our API is robust enough that almost anything you can do through ProVision could be recreated in the form of an isolated gadget. And because they're just made from html and javascript, it shouldn't be too strenuous for anyone to write a gadget of their own. If you want to create your own gadgets, it would be recommended to email us first with an outline of what you're trying to do. Then the recommended procedure would be to first create it as a standalone HTML/Javascript webpage that connects to our API (you may need to disable cross domain request security in your browser to make the AJAX connections work). Once you have your standalone page working, the process to turn that into an embeddable gadget is trivial.

Note: Gadgets are initialized as AngularJS applications. Both the AngularJS and jQuery libraries will be loaded on the page and available to use, but it is highly recommended to make the entire gadget in the form of an AngularJS app. But as noted above, it's best to contact us first so we can help you in the right direction.

Portable Gadgets

Portable Gadgets

Overview

ProVision's Portable Gadgets are drop-in code snippets that use the ProVision API to bring in data to other systems or web pages. Portable Gadgets allow for quick data access and increased integration.

Currently, four Gadgets are available: Global Search, IPAM Search, DHCP Search, and Log. Each Gadget comes in various default option types for display style, number of records return, or behavior. Additional client-side style customizations may be made to further integrate the gadget with company styles.

Global Search:

The Global Search Gadget utilizes ProVision's global search API to searching by name string and return ID, Type, and the Name. The search may be limited to specific types (IPAM, Resources, Zones, Records, Contacts, or All Types) if desired.

The screenshot shows a search results table with the following data:

ID	Type	Name
451	resources	6connect
3641	contacts	Leroy Jenkins
479	zones	6connect.com
1598	records	1234.com
1598	records	1234.com
1598	records	1234.com
1001	records	123ohsnap.com

Below the table, there is a search bar with 'All Types' selected, a 'Search' button, and a logo for '6connect'.

Log:

The Log Gadget provides detailed information on actions performed in ProVision. Actions may be filtered by Level, Category, Log ID, User, and Time (specific or a range), as well as results-per-page option set. Additional filtering options allow targeting of specific log entries.

Clicking on the blue arrow at the beginning of each log entry shows additional details about that log item.

The following filters and options are available:

Level: Under the "Level" dropdown box, select "All Levels", "Emergency", "Alert", "Critical", "Error", "Warning", "Notice", "Info", or "Debug".

Category: Under the "Category" dropdown box, select "All Categories", "User", "IPAM", "Resource", "Resource Holder", "DNS", "Peering", "Assistant", "API", "NTP", "Device", or "Reporting".

Results per page: In the "Results per page" text box, type the desired number of log entries to see per page. By default, this value is set to 100.

Search: Type a search string, such as the name of a resource, then click the "Search" button.

More Options:

Additional detailed filter and search options are available under the "More Options" link.

Log ID: Retrieve a specific log entry from its log_id parameter.

IP: Search by IP of the machine that created the event in the log.

Username: Filter logs by ProVision username, or by "Unknown" user.

Time: Filter log entries by exact time created. Must be in datetime format (2016-08-14 16:41:18).

Time Minimum: The earliest day and time of log entries to show in results. Must be in datetime format (2016-08-14 16:41:18).

Time Maximum: The latest day and time of log entries to show in results. Must be in datetime format (2016-08-14 16:41:18).

Getting Started With Portable Gadgets

Getting Started

- Getting Started
 - Adding a Portable Gadget to a Web Page
 - Requirements
 - Before You Begin
 - Step 1: Reference dependency files
 - Step 2: Create Gadget <div>
 - Step 3: Initialize the Gadget
 - a) Preparing the settings
 - b) Initialize the gadget HTML element
 - Basic Page Example

Adding a Portable Gadget to a Web Page

Requirements

Setting up Portable Gadgets requires a ProVision instance URL and valid API credentials (API key and secret key), as well as some familiarity with HTML, CSS, and Javascript.

Before You Begin

Before you begin, make sure you have access to the source code for the web page on which you want the portable gadget to appear, or create a simple new web page for testing purposes with minimal tags like this (with the location of steps included as comments):

```
<html>
  <head>
    <!-- STEP 1 WILL GO HERE -->

    <!-- STEP 3a WILL GO HERE -->
    <!-- STEP 3b WILL GO HERE -->
  </head>
  <body>
    <!-- STEP 2 WILL GO HERE -->
  </body>
</html>
```

Step 1: Reference dependency files

Include the following two scripts the <HEAD> block. They should reference your provision installation.

In this example, "https://cloud.6connect.com/6c_123" is the root folder of a 6connect installation, so replace that with your own 6connect instance URL.

```
<script type='text/javascript'
src="https://cloud.6connect.com/6c_123/portable/init.js"></script>
<link rel="stylesheet" type="text/css"
href="https://cloud.6connect.com/6c_123/portable/css/provision-portable.css">
```

Step 2: Create Gadget <div>

Place the html <div> tag for your gadget where you want it to appear in the page <body>, and give it a unique id.

Your gadget should be an html element in your page body (any contents inside the element will be removed). This example has a div referred to as "gadget" (as the ID).

```
<!-- provision gadget -->
<div id="gadget"></div>
```

Step 3: Initialize the Gadget

a) Preparing the settings

First, a settings variable must be prepared with the details of the gadget.

It must have the following keys for the provision url and api keys:

- provision_location
- provision_api_key
- provision_secret_key

...as well as the name of one of the gadget to load:

- search -- does a search with the global search API
- dhcp -- does a search with the DHCP API
- ipam -- does a search with the IPAM API
- [pv-logs](#) – details actions taken in ProVision.

Here is an example for a search gadget, loading with the search term "6connect". By default it will load up to five results per type.

```
<script type='text/javascript'>
var settings = {
provision_location: "https://cloud.6connect.com/6c_123",
provision_api_key: "00-ABCDEFGHJKLMN00",
provision_secret_key: "00abcd11ef22ghij3300klmno123",

search: "6connect",
};
</script>
```

Here is an example to load as an IPAM gadget, with an option to limit results to 10 records:

```
<script type='text/javascript'>
var settings = {
provision_location: "https://cloud.6connect.com/6c_123",
provision_api_key: "00-ABCDEFGHJKLMN00",
provision_secret_key: "00abcd11ef22ghij3300klmno123",

ipam: "6connect",
limit: 10
};
</script>
```

An example with the DHCP gadget:

```
<script type='text/javascript'>
var settings = {
provision_location: "https://cloud.6connect.com/6c_123",
provision_api_key: "00-ABCDEFGHJKLMN00",
provision_secret_key: "00abcd11ef22ghij3300klmno123",

dhcp: "Test",
};
</script>
```

b) Initialize the gadget HTML element

The gadget will initialize when scripted to do so with the provision() command. For the example html in section II, we can instantiate this gadget by running the following (as long as settings was prepared):

```
<script type='text/javascript'>
provision('#gadget', settings)
</script>
```

The first parameter targets the html element that is the gadget, using jQuery's selector format. In this case, it is an element with the ID "gadget".

Basic Page Example

Here is a simple example html page with a search gadget. In this example, a default search term of "6connect" is included, and the return limited 10 records.

```
<html>
<head>
<script type='text/javascript'
src="https://cloud.6connect.com/6c_123/portable/init.js"></script>
<link rel="stylesheet" type="text/css"
href="https://cloud.6connect.com/6c_123/portable/css/provision-portable.css">
<script type='text/javascript'>
var settings = {
provision_location: "https://cloud.6connect.com/6c_123",
provision_api_key: "00-ABCDEFGHJKLMN00",
provision_secret_key: "00abcd11ef22ghij3300klmno123",

search: "6connect",
limit: 10
};
provision('#search_gadget', settings);
</script>
</head>
<body>
<div id="search_gadget"></div>
</body>
</html>
```

Portable Gadget Customization

Customizing Portable Gadgets

- Customizing Portable Gadgets
- Customization Options
 - Required Settings:
 - Optional Settings:
- Sample CSS Customization
 - Alternating Row Formatting:

Customization Options

Portable Gadgets come with both built-in customization options as well as the ability to edit styles locally through CSS.

Required Settings:

The required fields are:

provision_location: the location of the provision installation
provision_api_key: available from the Admin API Tab in ProVision
provision_secret_key: available from the Admin API Tab in ProVision

Other required fields (by gadget)

Search:
 search: "string"
IPAM:
 ipam: "string"
DHCP:
 dhcp: "string"

Where, in each case, "string" is the search term used on the initial loading of the gadget. If it is an empty string (literally, ""), then gadget will load without a pre-defined search.

Optional Settings:

These settings must be included as parameters when initializing the gadget. See [Getting Started With Portable Gadgets](#).

limit: positive integer, or -1

The record return limit of the gadget. In some gadgets (search and DHCP) there are multiple types, so it limits per type. The default limit, if this option is not provided, is 5. If you specify limit a -1 (or basically any negative number), it will not enforce a limit.

links_change_window: true

setting this to true (not string "true" but actual true type in javascript) will make links change the current window. The default behavior (not having this option or false), would have links open a new tab.

interact: false

By default, there will be a search box on all these gadgets. But with this option set to false (again, using false not string "false") will remove that box so search cannot be changed.

Sample CSS Customization

Alternating Row Formatting:

Search results for "Test"

ID	Type	Name
329	resources	test
330	resources	test
3591	contacts	Test Again

FAQ

FAQ

How can take a manual backup of ProVision?

From the command line in your ProVision instance, you can get a manual SQL backup using the following way:

```
mysqldump -uUSER -pPASSWORD DATABASE > bkup.sql
```

You can get the values for USER, PASSWORD, and DATABASE by reading them from the following file:

```
[ProVision Root]/data/globals.php
```

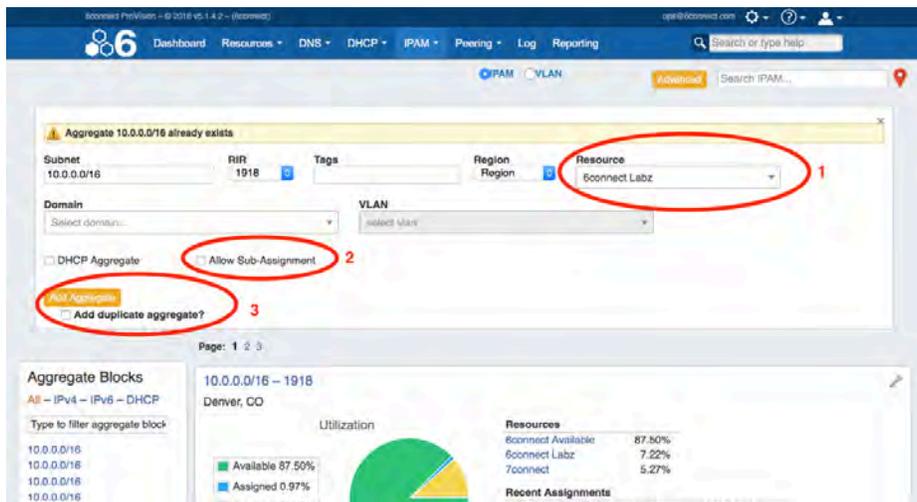

An example of a completed command:

```
mysqldump -uroot -p6connect_DBPSWD qa_5_1_5 > bkup.sql
```

You can then use this .sql file to restore the old version should you need to revert the installation.

How can I manage overlapping/duplicate IP blocks?

When managing duplicate/overlapping IP ranges with ProVision, there are several methods you can use to ensure that blocks are "unique" and still leverage functions like Smart Assign. The easiest approach is to use metadata for the aggregate (LIR, Region, Resource, etc.). From the ProVision GUI, you can use the "Add Aggregate" function on the IPAM tab (image below) to add a duplicate aggregate. By assigning the new Aggregate to a Resource (#1) you will tie the block and a Resource together. You most likely wish to make assignments out of this new aggregate, so you can enable subassignments (#2) before adding the aggregate (#3).

Now the block will be assigned to a Resource, and you can still provision smaller blocks out of these duplicate parent blocks. When using the IPAM gadget from the Resource screen, just go the Advanced section and you will have more options available for assigning IP data. If you have "strict" enabled, your Smart Assign function should work as expected when you use the LIR or Assigned Resource fields for blocks.

IPAM

Assign Block:

Direct Assign

x.x.x.x/yy or x:xx:xx:xx:xx/yyy Assign

Smart Assign

IPv4 Size RIR Region Select tag...

Tag selection mode:

- Standard – match all selected tags
- Strict – match exactly the selected tags
- Exclude – match blocks not tagged with any selected tags

Hide advanced options

CODE Domain Select domain... VLAN LIR Assigned Resource

Note: The Assigned Resource option will filter by blocks that are already assigned to the selected resource and are set to Allow Subassignments. If no resource is selected, the filter will default to Available blocks.

Smart Assign Smart Browse

- ✓ Does ProVision support configuring a DNS server SOA that is different from the actual server name?
Yes - in DNS Admin, simply specify the DNS Servers like normal and then attach the zones as needed with the desired SOA.
- ✓ On the dashboard, I see "n+1" users - why?
The users list includes a "system user" that is only used by ProVision internally in the application.
- ✓ I have already SWIPed subnets to ARIN. What happens if I try to SWIP from ProVision, but the block is already SWIPed?
In the case when a user already has SWIPped blocks to ARIN, 6connect checks prior to actually performing a SWIP. In the process, if the IP block is already SWIPped, it will check for existing ARIN customer data and update the 6connect data to reflect what ARIN has on file. Once that is complete, the user can then perform a de-SWIP function using ProVision.
- ✓ How does 6connect avoid duplicate assignments or resolve conflicts?
When you make an API request to assign a block, if the block is already assigned to another resource, you will receive an error. If your process is to search for and then assign blocks, the Smart Assign API call may be very helpful. That call combines the search and assignment into one action.
- ✓ My VM works, but I am getting a "URL Not Found" error when using ProVision
Please make sure that URL rewriting is enabled in your instance (apache mod_rewrite)
- ✓ My DNS zone views aren't working as they should!
In some legacy instances we have seen zone record-view linkages come out of alignment and result in unexpected behavior.

BACKUP YOUR DATABASE

Please note that the following mysql commands modify your database! Please take a backup copy of your database before performance any database modifications.

First, verify the error with the following mysql commands:

```
SELECT count(*) FROM `zone_server_linkage` as t1
INNER JOIN `records` as t2 ON t1.`zoneid` = t2.`zone_id`
INNER JOIN `dns_views` as t3 ON t1.`serverid` = t3.`server_id` AND
`name` = '_6connectDefault'
LEFT JOIN `dns_view_record_linkage` as t4 ON t2.`id` = t4.`record_id`
AND t3.`id` = t4.`view_id`
WHERE t4.`id` IS NULL;
```

If the reply comes back non-zero, then your database is most likely exhibiting unexpected behavior.

The following mysql commands will re-align all the record-view linkages:

```
INSERT INTO `dns_view_record_linkage` SELECT '', t2.`id` as `record_id`,
t3.`id` as `view_id` FROM `zone_server_linkage` as t1
INNER JOIN `records` as t2 ON t1.`zoneid` = t2.`zone_id`
INNER JOIN `dns_views` as t3 ON t1.`serverid` = t3.`server_id` AND
`name` = '_6connectDefault'
LEFT JOIN `dns_view_record_linkage` as t4 ON t2.`id` = t4.`record_id`
AND t3.`id` = t4.`view_id`
WHERE t4.`id` IS NULL;
```

Contact support(support@6connect.com) if you have any additional questions or this does not resolve the issue.

▼ How can I 'reserve' IP space?

To create a reserved pool of IP space, you can create a Section called "Reserved", add the IPAM gadget to it, then create an Entry with that Section to be the address group. From there, use the IPAM gadget and the IPAM Manage page to assign and unassign IP space from that pool.

The workflow for this would be:

1. Assign IP space to the "Reserved" Section.
2. When you are ready to pull space from "Reserved", unassign the desired block. This moves it to the holding tank.
3. Override the holding tank to make the space "available". This can be done in the IPAM manager via the "Override Holding" wrench option, or a manual 'pull out of holding' API call.
4. Assign the block to the desired Resource.

▼ How do I change the URL of my ProVision instance?

Depending on your version of ProVision, you may need both steps. Edit the file <6connect web root>/data/globals.php and:

- 1) Change the \$hostname variable to the new value
- 2) Change the \$base_url to the new value

Please note that you may also need to update the SSL certs, httpd settings, etc.
