

ProVision 4.1.9

The 4.1.9 release is a bug fix release that contains a few new feature improvements.

Feature Improvements

IM-1258 - Add separate name field to DNS servers, so there is both an FQDN and name. There are now a separate fields for a server Nick Name and it's FQDN/IP. Now DNS servers can be easily recognized by their common/nick name or their FQDN/IP address, as both are displayed representing the server.

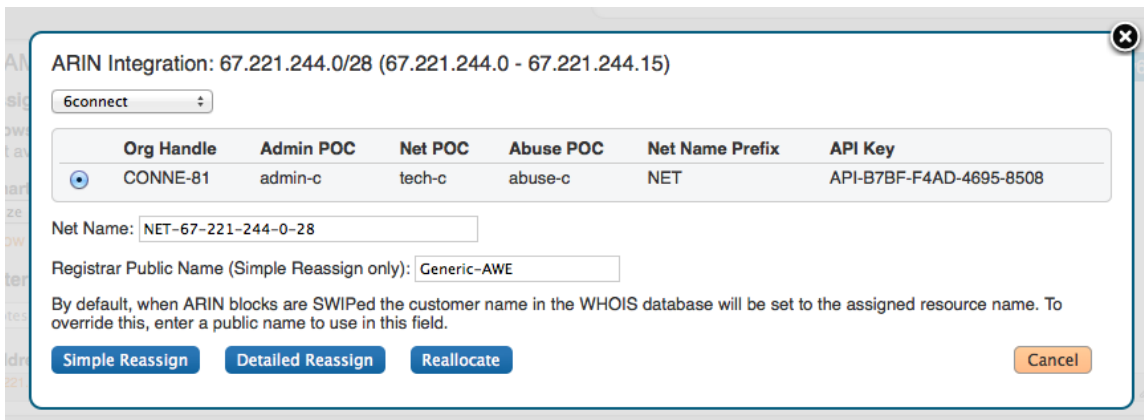

The screenshot shows the 'Manage DNS Servers' interface. It includes a 'Server:' dropdown menu with 'ns1-ns1.6clabs.com' selected and a 'New Server' button. Below this are input fields for 'Nick Name' (containing 'ns1') and 'FQDN or IP' (containing 'ns1.6clabs.com'). To the right of the FQDN field is an example: 'ex: ns1.dns.6connect.net or 216.239.32.10'. There are three dropdown menus: 'Default' (set to 'Do Not Add to New Zones'), 'Transfer Type' (set to 'ISC BIND'), and 'Server Type' (set to 'Master'). At the bottom is the 'SOA' field with the value 'ns1.dns.6connect.net. hostmaster.6c' and an example: 'ex: ns1.dns.6connect.net. hostmaster.6connect.net.'

IM-1329 - Add field override for Net Name on swip.

IM-1312 - Add override field for Customer Name on swip

Both the ARIN Customer Name and Net Name can be over ridden from the automatically generated defaults at swip time using the fields provided on the RIR Integration Panel.

The screenshot shows the 'ARIN Integration' panel. At the top, it displays 'ARIN Integration: 67.221.244.0/28 (67.221.244.0 - 67.221.244.15)'. Below this is a dropdown menu for '6connect'. A table lists the following information:

Org Handle	Admin POC	Net POC	Abuse POC	Net Name Prefix	API Key
CONN-81	admin-c	tech-c	abuse-c	NET	API-B7BF-F4AD-4695-8508

Below the table, there is a 'Net Name' field with the value 'NET-67-221-244-0-28'. A 'Registrar Public Name (Simple Reassign only):' field contains 'Generic-AWE'. A note states: 'By default, when ARIN blocks are SWIPed the customer name in the WHOIS database will be set to the assigned resource name. To override this, enter a public name to use in this field.' At the bottom, there are four buttons: 'Simple Reassign', 'Detailed Reassign', 'Reallocate', and 'Cancel'.

Bug Fixes

IM-1330 - API - IPAM get parameter block not working as expected

IM-1324 - Missing images on admin-dhcp.php

IM-1323 - API - Inconsistent results between Resource Get and Resource Add

IM-1322 - IPAM Gadget - Action menu display issue sub assignments allowed

IM-1321 - IPAM Gadget - All tags should display during edit, not just in use

IM-1319 - IPAM Admin - Bad URL "Back to IPAM Admin" in tag editor

IM-1259 - configTest - Add test items for expect, namp, and php hash extension

IM-1142 - Center command results given by assistant
