

IPAM Parameters

IPAM Lists Management - Overview

IPAM Lists Management is accessed from the Admin section, under the [IPAM Admin](#) tab.

Through this area, admin users can update IPAM tags, IPAM Regions, IPv4 / IPv6 subnets, IPAM Rules, Numbering Authority, and IPAM / VLAN Columns.

- [Add / Edit IPAM Tags](#)
- [Add / Edit Regions](#)

Add / Edit IPAM Tags

When you are applying properties to IP blocks, you have the option to edit tags. IPAM Tags are used in a number of areas and can be added or edited from this screen.

To add a new IPAM tag, type the desired name value for the new tag in the box at the top of the Edit IPAM Tags page and click "Add".

Tags 53

Manage tags settings globally for all users. Add, edit, remove and reorder tags by clicking and dragging into the desired order. You can also order them alphabetically by clicking the Sort button. Save to persist changes.

Options Sort Alphabetically Filter tags... Q

Back to IPAM Admin [Save Changes](#)

When complete, be sure to click on the "Save Changes" button to save your changes.

Add / Edit Regions

If enabled, Regions can function as a way to further define your network segments (regional tie-downs, etc.). This gives you flexibility for allocations and assignments beyond simply using Tags. Regions are used by the [IPAM Gadget](#), the IPAM Manage UI, and IPAM Map View.

Access IPAM regions from [IPAM Admin](#) **Edit IPAM Regions**.

Back to IPAM Admin

The Regions display includes fields for Region Code, Name, and Address.

- 'Region Code' is the shorthand name that will show in the IPAM Gadget and IPAM Manage screens.
- 'Name' is the long form name value that will be written to the database, used for API calls, and is also used for some filter selectors.
- The 'Address' field is used by IPAM map view (via Geocode API) to geolocate aggregates with that assigned region. Address may be in the form of a City / State / Country, a full street address, a company name, or other search term that the Geocode API can return a location for. The more accurate your address information, the more accurate map view will be with your aggregate locations. To use regions, you will need to apply a Geocode API Key. An "address" value that appears invalid will display a yellow warning symbol.

Applying a Geocoding API Key:

Step 1: Obtain a Google Geocoding API Key

To get a Google Geocoding API Key, follow the instructions listed [here](#):

How to get a Google Geocoding API Key

Note: In order to obtain a Google Geocoding API Key, a company must have a subscription enabled to Google Cloud Platform Console.

Step 2: Assign the API Key to IPAM Regions

Once assigned a Google Geocoding API Key, from the Edit Regions page, click "Geocode API Key". Then select the Google radio button, paste the API key into the Geocode API dialog, and click "Save". You can test the API Key by clicking the Test button at lower left.

The screenshot shows the 'Geocode API Key' dialog box. At the top, it says 'IPAM Regions requires a Geocode API Key in order for IPAM Maps to properly determine a Region's location.' Below this, under 'Geolocalization Service Provider:', the 'Google' radio button is selected and circled in red. A text box below says 'To obtain a Google Geocode API Key, follow the instructions at Google's Geocoding API - 'Get API Key' page.' Under 'Google Geocode API Key', there is a text input field with the placeholder 'Enter Api Key...' and a red arrow pointing to it. At the bottom left, a green 'Test API Key' button is circled in red. At the bottom right, a blue 'Save' button and a grey 'Close' button are circled in red.

Step 1: Obtain a Radar Geocoding API Key

To get a Radar Geocoding API Key, follow the instructions listed here:

How to get a Radar Geocoding API Key

Step 2: Assign the API Key to IPAM Regions

Once assigned a Radar Geocoding API Key, from the Edit Regions page, click "Geocode API Key". Then select the Radar radio button, paste the API key into the Geocode API dialog, and click "Save". You can test the API Key by clicking the Test button at lower left.

The screenshot shows the 'Geocode API Key' dialog box. At the top, it says 'IPAM Regions requires a Geocode API Key in order for IPAM Maps to properly determine a Region's location.' Below this, under 'Geolocalization Service Provider:', the 'Radar' radio button is selected and circled in red. A text box below says 'To obtain a Radar Geocode API Key, follow the instructions at Radar's Geocoding APIs - 'Get your API Key' page.' Under 'Radar Geocode API Key', there is a text input field with the placeholder 'Enter Api Key...' and a red arrow pointing to it. At the bottom left, a green 'Test API Key' button is circled in red. At the bottom right, a blue 'Save' button and a grey 'Close' button are circled in red.

Managing Regions

To add a new Region item, click the "Add Region" button at the top of the screen.

The screenshot shows the 'Edit Regions' page. At the top right, there is a green 'Add Region' button circled in red, and a blue 'Geocode Api Key' button. Below this is a blue header bar with 'Regions 24'. Underneath is a 'Manage Regions' section with a table. The table has columns for 'Region Code', 'Name', 'Address', and 'Location Status'. There are also controls for 'items per page' (set to 10) and a 'Search by name...' input field with a search icon.

In the form that appears, type in a new Region Code, Name, and Address into the empty fields and click "Save".

The "Create New Region" form contains three input fields: "Region Code" with placeholder text "Region Code...", "Name" with placeholder text "Enter Name...", and "Address" with placeholder text "Enter Address...". Each field has a red arrow pointing to it. At the bottom left is a green "Check Address" button. At the bottom right are two buttons: a blue "Save" button circled in red, and a grey "Close" button.

The new Region will be added to the Region list.

The "Regions" table has a header bar with "Regions 24", a "Manage Regions" section with "items per page" set to 10 and a search bar, and a table with columns: Region Code, Name, Address, and Location Status. The first three rows are visible: ASH (Ashburn, VA), AKL (Auckland, NZ), and BOS (Boston, MA). Each row has a checkbox on the left and a gear icon on the right. A context menu is open for the BOS row, showing "Edit" and "Delete" options. The gear icon for the BOS row is circled in red.

	Region Code	Name	Address	Location Status
☐	ASH	Ashburn, VA	Ashburn, VA	
☐	AKL	Auckland, NZ	Auckland, New Zealand	
☐	BOS	Boston, MA		

To **sort** the regions list, click on a column header to sort by Region Code or Name.

To **edit** a region, right click on the row and select "Edit" from the Action Menu. This will bring up the edit modal. Input your desired changes, then click "Save".

To **delete** a single region, select "Delete" from the the Action Menu (gear icon).

To **delete multiple** regions, select the regions to delete by clicking the checkboxes at left. Then, click on the "Actions" menu at the top of the list and select "Delete All".

The "Regions" table shows the "Actions" menu at the top, which is circled in red. The menu is open, showing "Delete all" and "Fill Empty Locations" options. A red arrow points to "Delete all". The table below shows the first five rows: ASH, AKL, BOS, CAI, and CPT. The BOS and CAI rows are selected, indicated by blue checkboxes and blue background shading. The gear icon for the BOS row is circled in red.

	Region Code	Name	Address	Location Status
☐	ASH	Ashburn, VA	Ashburn, VA	
☐	AKL	Auckland, NZ	Auckland, New Zealand	
☒	BOS	Boston, MA		
☒	CAI	Cairo, Egypt		
☐	CPT	Cape Town, South Africa	Cape Town, South Africa	

You may also right click on the selected items to open a context menu to either "Unselected all" or "Delete all".

Region Resource Generation

Optionally, users may generate a resource entry for a region, in order to associate items such as contacts, notes, linked resources, or fields with that region.

Clicking on a region link from IPAM Manage will automatically generate a resource entry for that region, under the "SystemRegion" section.

Manage aggregate												
4.4.0.0/16 - LACNIC				Switch to Parent view	Netblock Tree	export to CSV	actions +	Search within this aggregate...

Users may then use those Gadgets on the region resource to associate contacts, notes, custom fields, or other information to that region.

Add / Edit IPv4 / IPv6 Subnet Dropdowns

When assigning blocks using the "Smart Assign" function in the [IPAM Gadget](#), the user has an option to assign an IP resource by allocation size. Assignments down to a single host level (/32 for IPv4, /128 for IPv6) are supported.

Note on Editing the Subnet Dropdown

Keep in mind that this is a global edit. If the values in the dropdown are changed, it will affect ALL users.

To add a new Subnet item, click on "Add Item" at the top of the Edit List: IPv4 or IPv6 Subnets page.

Edit IPv4 Subnets

Sort Numerically
Add Item

Subnets List 13

Drag to change order, add, update or remove subnet value for IPv4 up to 32. Save changes to preserve order and modifications.

Back to IPAM Admin
Save Changes

To **edit** a subnet, simply type your changes in to the text box. Remember to click "Save Changes" before exiting.

To **reorder** the subnet list, click and hold on the "list" icon (three lines) to the left of the subnet, then drag to the desired location in the list and release.

After adding or editing a subnet, you may wish to clean up the list order by hitting "Sort Numerically" at the top of the page to reset the list order, including the new entry.

To **delete** a subnet, click on the red "Delete" button to the right of the subnet entry.

When complete, be sure to click on the "Save" button to save your changes.

Edit IPAM Rules

IPAM Rules allow for certain address positions within an IP Block to be reserved when utilizing Direct Assign and Smart Assign.

These rulesets may be managed in the "Edit IPAM Rules" section of IPAM Admin.

IPAM rules			
IPAM Rules allow users to exclude IP addresses from being assigned by Smart Assign or Direct Assign, based on the IP address position in the block. Admin users may view all existing IP Rules, the blocks affected by each rule, create new rules, and delete rules from this page. Changing the positions in a ruleset applies that change to all blocks using that rule - ensure that changes are desired universally when updating a rule.			
Search for a rule			
Rule name	Creation date	Positions	Actions
Reserve 1st	2021-08-02T16:51:30+0000	1	View Affected IP Blocks Delete rule
Reserve 3rd	2021-08-03T17:55:45+0000	1	View Affected IP Blocks Delete rule
Reserve first 3	2021-08-10T16:31:00+0000	3	View Affected IP Blocks Delete rule

For additional details, see [IPAM Rules](#).

Numbering Authority

Numbering Authority allows Admin users to configure domain sets of values, for use with associated functions or external number tracking.

Numbering Authority			
Create New			
Configure Authority			
Numbering Authority is a configurable set of values and the associated functions to track which values have been handed out and which are still available.			
Filter by Type: none Search...			
↑ Name	↑ Reuse values	↑ Type	Actions
Cisco Router VLAN Numbering Domain Template	Yes	Multi-range Ranges: 1-1001 Excluded Ranges: 1002-1005	Get Next Value View Assigned Values Delete
Cisco Router VLAN Extended Numbering Domain Template	Yes	Multi-range Ranges: 1-4094 Excluded Ranges: 1,3968-4047,4094	Get Next Value View Assigned Values Delete

With Numbering Authority, you can create new numbering domains, track which values have been handed out, free values no longer in use, generate the next sequence value, and associate keys-value pairs to a number value. Numbering Domains may be used with APIv2 to generate numbers for use within ProVision instances or custom applications.

Available Domain Types

Six numbering domain types are available in Numbering Authority: Sequential, Multi-Range, Meta Multi-range, UIUDv4, IPv6 Sparse Allocation, and Meta IPv6.

Sequential:

Provides a sequential number domain starting with '0' and progressing in numerical order. Potential Applications: Ticketing Queues, Customer Numbers

Multi-Range:

User-defined numbers and number ranges (e.g.: 2-3,4-6, 25, 27-28) to include or exclude as available. Potential Applications: VLANs

Meta Multi-Range:

The Meta Multi-range numbering type is similar to Multi-range, but includes additional options to specify the ordering sequence.

Users define individual numbers and number ranges (e.g.: 2-3,4-6, 25, 27-28) to include or exclude as available, and then may also specify a Selection name and algorithm to specify the order.

UIUD v4:

Generates a Universally Unique Identifier according to v4 (Random) standard. Potential Applications: Unique Identifiers

IPv6 Sparse Allocate:

Determines the next IPv6 block to assign to evenly distribute assignments throughout the provided range. Used with the IPAM IPv6 Aggregate Sparse Allocate function. See: [Working with IP Aggregates](#) . Applications: IPv6 Sparse Allocation

Meta IPv6:

The Meta IPv6 numbering type generates the next IPv6 block of the specified mask from a larger aggregate. Users may specify a Selection name and algorithm to specify the order (forwards/backwards).

Optionally, new sub numbering domains may be created automatically at each number generation in order to generate assignment blocks for hierarchical IPv6 relationships.

Working with Numbering Domains

See below for additional information on creating Numbering Domains and using domain actions.

Create a Numbering Domain

Go to Admin IPAM Admin, and select the "Numbering Authority" page.

Create a new numbering domain by expanding the "Create New Numbering Domain" section, then typing in a name for the new domain and selecting a domain type.

Create New Numbering Domain

Name:

Custom Range Domain

Type:

Multi-range

Ranges:

1-100

e.g.: 15, 20-29, 32, 1-10

Exclude ranges:

2-10

e.g.: 2-3,4-6, 25, 27-28

☒ Reuse values

Create

Enter information for the specific domain type, if necessary, and select whether to allow number reuse. When done, click "Create".

All Numbering Domains must have, at minimum "Name" provided and a "Type" selected.

Additional options may exist based on the selected Numbering Domain type:

Multi-Range:

- **Ranges:** Enter the numbers / number ranges to include
- **Exclude Ranges (optional):** Enter any numbers / number ranges to exclude

Meta Multi-range:

- **Domain**
 - **Ranges:** Enter the numbers / number ranges to include
 - **Exclude Ranges (optional):** Enter any numbers / number ranges to exclude
- **Selection Types:**
 - **Selection Name:** Enter a nickname for each desired selection order to add
 - **Selection algorithm:** Choose the number ordering method to use for each selection type added. Options are: Forwards, Backwards, Even first, or Odds First.

Meta IPv6:

- **Domain**
 - **IP Block:** Enter the parent IP Block from which to generate the IPv6 addresses
 - **IP Mask:** Enter the mask of the parent IP Block
- **Selection Types:**
 - **Selection Name:** Enter a nickname for each desired selection type to add
 - **Mask:** Enter the desired mask of the child blocks to generate
 - **Selection algorithm:** Choose the number ordering method to use for each selection type added. Options are: Forwards, Backwards.
 - **Create Numbering Domain:** If other Meta IPv6 Numbering Authority Domains exist, you may opt to create a new numbering domain from an existing domain each time a number is generated. The automatically generated sub-domain may then have numbers generated independently. This may be useful in cases of complicated hierarchical IPv6 relationships, or which multiple levels of exclusions exists.

IPv6 Sparse Allocate:

- **Starting IPv6:** The starting IPv6 block, e.g ABCD:EF01:2345::
- **Starting Block Prefix:** Prefix for the starting IPv6 block, e.g 48
- **Increments:** the size / increment to use when sparse allocating, e.g. 64
- **Allocation Type:** the allocation direction to use - Leftmost, Center, or Rightmost

Number Domain Actions

Numbering Authority

Create New >

Configure Authority

Numbering Authority is a configurable set of values and the associated functions to track which values have been handed out and which are still available.

Once an Automatic domain has been created, it can have values generated and be managed independently from the original parent domain.

This allows for more complicated hierarchy assignment systems to have numbers generated at each tier separately, using different masks and/or selection ordering.

View Assigned Values:

View values that are assigned to the domain, view used/free status, free assigned blocks, and save key-value metadata to values.

Numbering Authority

(3) Numbering Domain Values For: Custom Range Domain

↕ Value	↕ Free	Metadata			Actions
1	No	New key	New value	Save	Free
11	No	New key	New value	Save	Free
12	No	New key	New value	Save	Free

Close

Increment: 64

Sort by Value and Free/Used values by clicking the column names

To add metadata to a value, enter your information into the "Key" and "Value" fields under Metadata, then click "Save".

Free a value for reuse, if allowed, by clicking "Free" under the value Actions column.

Delete:

Deletes the numbering domain.

Edit IPAM or VLAN Columns

The Edit IPAM Columns and Edit VLAN Columns pages lets you change the order, column name, and visibility of IPAM / VLAN columns globally for IPAM / VLAN areas, respectively.

Editing IPAM Columns will affect the order, name, and visibility of columns in IPAM Manage and the IPAM Gadget, and the available fields in Edit Block for both VLAN and IPAM.

Editing VLAN columns will affect the order, name, and visibility of columns in VLAN Manage, VLAN Advanced, and the available fields in Edit Domain / Edit VLAN.

Additionally, for both IPAM and VLAN, any disabled fields will not be filterable or accessible in IPAM / VLAN Reports.

Eleven default fields and ten user-defined "Metadata" fields are available for customization.

Edit IPAM Columns 24

Manage column settings globally for all users. Edit column names, toggle visibility, reorder columns by dragging the a row and dropping in the desired order. Optionally, you can define **constraints** associated to each column that allows IPAM data to be entered only if it meets the predefined conditions. Some columns do not allow constraints.

Field Name	Column Name	Options
☐ CIDR	Address	☐
☐ MASK	Mask	☐
☐ RESOURCEHOLDERNAME	Assigned to	☐
☐ TAGS	Tags	☐

Keep in mind that "Edit Columns" is a global edit. If the values for order, header, or visibility are changed, it will affect ALL users!

To **edit** a column name, simply type your changes into the text box. and click the "Save Changes" button.

Back to IPAM Admin **Save Changes**

To **toggle visibility** for a column, click the eye icon to the right of the column name to enable / disable visibility.

This shows or hides the column in both IPAM Manage and the IPAM Gadget, and affects all users.

META9	Metadata9

Back to IPAM Admin **Save Changes**

When complete, be sure to click on the "Save Changes" button to save your changes.

Adding Constraints to IPAM Columns

The Constraints system allows for custom field validation and field restrictions to be created for IPAM fields. The applied constraint may be anything from a numerical comparison operation, a check against a pre-determined text string, ensuring selections from a pre-set list, or forcing entries into a specific format, such as IPv4/IPv6, phone number, or RegEx. For more detail on available types of constraints and creating them see the Constraints section.

A column that may have a constraint applied will have a checkmark icon in the "Options" column. Click the icon and select a constraint from the dropdown.

Click "Save".

The applied constraint name will then be displayed in the column row.

NOTES	Notes		
META1	Metadata1	Length Max	
META2	Metadata2		
META3	Metadata3		
META4	Metadata4	Bird Enum	
META5	Metadata5	Length Max	
NAT	NAT		
META6	Metadata6		
META7	Metadata7		
META8	Metadata8		
META9	Metadata9		
META10	Metadata10		

Back to IPAM Admin **Save Changes**

Click "Save Changes" before exiting the IPAM Column page to retain changes.
