qa local peer	8038		none

The **Peers** subtab lists existing peers in ProVision. Here, you can add new peers and view peer details. ProVision supports Peer lookup from PeeringDB, as well as creation of "Local Peers". Local or custom Peers that are 'private' or not registered with PeeringDB may also be used for session creation.

Working with Peers

Peer List

The Peer list shows peers currently in ProVision, their ASN, associated exchange, and whether session exist.

Filter the peer list by typing all or part of a peer name into the "Filter" text box in the right side of the list header, and the list will narrow down to matching Peers.

You may also sort by any field by clicking on the column name in the header. To view a Peer, you may click anywhere in the row for the peer, or click the "View" button.

Organizations will show as Peers in this list if:

- There is an existing session in Provision with the organization set as the destination - applies to both "Add Session" and "Add Peer" Configure Sessions
- The organization is marked "Existing Peer" in Exchange communications

Manually added Local Peers will show in the Local Peer list, below the standard Peer List.

Add Peers

Adding a Peer can be done via many methods in ProVision, depending on whether the peer is from PeeringDB, Local, and what the peer/session status is.

In general, Peers will added from either:

- PeeringDB through "Import Peer", session creation, or exchange communications
- Local / Custom creation through "Add Peer" or session creation

The following approaches will result in a Peer being added into ProVision:

- Create a session for a peer, selecting the Peer from PeeringDB options available under the [Session tab](#) "Add Session" form.
- Create a session for a local or custom peer, selecting an existing local peer or manually entering a custom destination in the [Session tab](#) "Add Session" form.
- Manually create a Local Peer, from "Add Peer".
- Import/search for a Peer from PeeringDB, then add the peer by [configuring multiple sessions](#).
- Add a peer without creating sessions by marking the peer as "existing" under [ExchangeCommunications](#). The Peer will show in the Peer List, but no sessions will exist for the peer until they are [created in ProVision](#).

Add PeeringDB Peer (Import Lookup)

Peers may be added via finding a peer from PeeringDB to import,

You can search for Peers by clicking "Import Peer" on the **Peers** or **Peer Details** pages.

The "Import Peer from PeeringDB" search module will open. Enter all or part of the peer name, then click "Search". The results will show in a list below.

Some Local Peer	8038		Equinix Palo Alto

Add Peer via Session

New Peers are added when creating a session with that Peer. While creating a new Session, you may select a PeeringDB Peer, an existing Local Peer, or create a new custom Peer.

Add Session Information

Click "Add Session" from the Peering Sessions sub-tab.

In the Create New Session Form, type the session information, selecting the appropriate exchange type for the planned Peer. If using a Local Peer, "No Exchange" is an available option.

The screenshot shows the 'Sessions' page header with an 'Add Session' button circled in red. Below is the 'Create New Session' form. The 'Type' dropdown is set to 'Peer'. The 'Exchange' dropdown is open, showing options: 'No Exchange (Local Peers Only)' (selected and circled in red), 'Equinix Palo Alto', and 'FOIX'. A 'NOTE' field is visible below the dropdown.

Select or Add Destination

The 'Destination' section contains a blue instruction bar: 'Select peer data from PeeringDB, the Local Peer database, or specify custom data for the session.' Below are two panels. The 'PeeringDB Lookup' panel has 'Peer Name' and 'Public IP' dropdowns. The 'Local Peer Lookup' panel has 'Peer Name' (set to 'Some Local Peer' and circled in red) and 'IP Address' (set to 'ASN 8038 - 1.1.1.1' and circled in red) dropdowns.

Under the **Destination** section, select or type in information for a peer. You may add Peer information from any of the three available methods:

- Use PeeringDB Lookup to select a PeeringDB Peer (the destination fields will be automatically populated).
- Look up an existing Local Peer under "Local Peer Lookup" by selecting the peer name and IP address (the destination fields will be automatically populated).
- Manually add a new Local or Custom Peer, by directly typing the Peer Name, ASN, and IP in the Destination fields.

The screenshot shows the session creation form with the following fields: 'Peer' (set to 'Some Local Peer'), 'ASN' (set to '8038'), and 'IP Address' (set to '1.1.1.1'). There is a checkbox for 'Configure router after saving'. At the bottom right, there are 'Create' and 'Cancel' buttons, with the 'Create' button circled in red.

When complete, click "Create".

The new Session will be added to the Session List.
